This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

MONOGRAM OIL

"BEST FOR YOUR ENGINE"

UNIVERSITY OF CALIFORNIA

Mr. Dealer:—

Can you afford to disregard *your own* interests and not carry

MONOGRAM OIL

The following are some reasons why you should handle it:
It is a good oil and will satisfy your customers in every way.
It is well advertised and there is a constantly increasing demand for it.
It has been continually successful under one brand name.
It can be had almost anywhere as our branches and distributing stations cover the country.
And your interests as a dealer are protected as we refer inquiries and orders from automobile owners to our dealers.

KINCAID Automobile Oils and Greases

Mr. Dealer:

Are you planning business for the future or do you expect to give it up next year? You cannot build a reputation with inferior lubricants. There are too many come-backs. You may make more money for a year, but those come-backs wipe out the profits. Cut prices and large discounts are never obtained in High Grade Automobile Oils. The KINCAID line will increase your business, bring you new customers and keep present ones satisfied.

Our experience shows us that there is as much difference in refining oils for gas engines, as there is in building the motors. We have advanced with the times. Our formulas are up-to-date, and we feel warranted in saying that the KINCAID OILS are the best on the market.

World's Lowest Pricec

FOUR-CYLINDER WATER-COOLED RUNABOUT

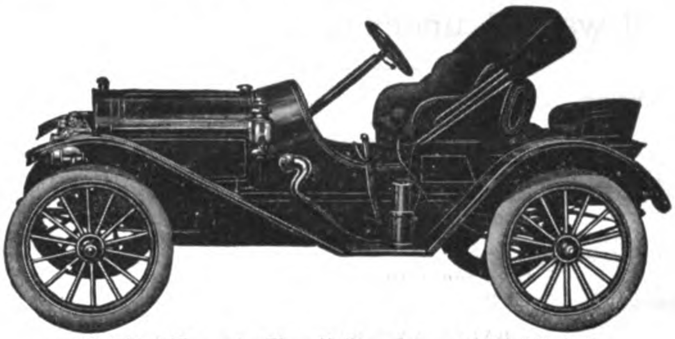
We Maintain the Quality and Reduce the Price

METZ "TWENTY-TWO"

$495

WHY?

Because we have the simplest and most practical car to manufacture, and it is built entirely in our own works.



METZ "Twenty-Two" Roadster 1912 Model.
Completely Equipped as Shown $495.

$495

WHY?

Because our exceedingly low overhead and selling expenses add no excessive burden to the actual cost of materials and manufacture.

The METZ "Twenty-Two" is the greatest automobile value ever offered and is the first four-cylinder runabout to be sold for less than $500.

The first four-cylinder runabout completely equipped as shown in above illustration, including **Bosch Magneto and Goodrich Tires**, ever sold for less than $750.

The METZ "Twenty-Two" is also the most economical runabout. It will carry you from 28 to 32 miles on a gallon of gasoline, 100 miles on a pint of lubricating oil, and 8000 to 10,000 miles on a set of tires.

The METZ "Twenty-Two" is guaranteed to climb the hills as fast as any car, regardless of price or power.

It is extremely easy riding, simple in its operation, responsive to the least touch of the throttle, and a car that any man, regardless of what make of large car he might own, would be proud to drive.

It is the most practical car for business or professional men or for those who want simplicity with quality, and a car dependable under all conditions.

In the METZ "Twenty-Two" you have the greatest automobile efficiency at the least possible cost.

Read the specifications carefully, compare them with any other car near the price, and you will instantly appreciate just what a revolution in automobile prices the METZ "Twenty-Two" runabout is at $495—not overlooking the fact that the equipment is included in this figure.

MOTOR—4 cylinders, cast en-bloc—3¾-inch bore, 4-inch stroke. Valves, push rods and springs completely enclosed.

VALVES—Enclosed, liberal in size, inlet and exhaust, right-hand side of motor.

COOLING SYSTEM—Thermo-syphon.

WATER CAPACITY—3½ gallons.

CARBURETOR—Float feed automatic.

HORSE POWER—22 H. P.

IGNITION—High tension magneto.

LUBRICATION—Constant level splash system, operated by pump.

FRAME—Pressed steel channel section.

SPRINGS—Full elliptic all around.

AXLES—(front and rear). Both of cold drawn steel tubing.

WHEEL BASE—90 inches.

WHEELS—30-inch artillery type.

TIRES—Standard Clincher, best quality, 30x3-inch.

BRAKES—Multiple disc brakes in rear hubs.

BODY—Wood with metal panel. Seat neatly upholstered in genuine leather.

COLOR—Battleship gray, white striping.

EQUIPMENT—High tension Magneto, Top, Slip Cover, Gas Lamps and Generator, Dash Lamps, Tail Light, Horn, Set of Tools, Tire Pump, and Complete Tire Outfit. This equipment is furnished without additional charge.

CONTROL—Two foot pedals, one operates the brakes, the other the clutch. Shifting side lever, selective change gear. Throttle adjusting lever on steering column.

STEERING GEAR—Rack and pinion adjustable for wear.

GASOLINE TANK—Capacity 7 gallons, providing a mileage capacity of over 200 miles.

TREAD—48 inches or standard. Construction of a type that either tread can be obtained by simply reversing wheels.

SHAFTS—Crank and cam shafts, drop forged, heat treated, with all surfaces ground to absolute accuracy.

BEARINGS—Superior white metal in motor, ball bearings in transmission and wheels.

SPEED—5 to 10 miles per hour on hig gear.

WEIGHT—Completely equipped. 100 pounds.

GEAR RATIO—3-1 on high gear.

PRICE INCLUDING COMPLET EQUIPMENT $495.

Owing to the big demand for these cars, we will fill all orders strictly in the order of their receipt. This is the sensation of the automobile industry and your order should be placed at once to avoid disappointmen

Dealers—Your Opportunity

We have a splendid propos tion to make to live automobil agents everywhere who are fa sighted enough to take adva tage of the sensation this offer will create. Write today for particulars.

THE ACCESSORY —AND— GARAGE JOURNAL

Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. I. PAWTUCKET, R. I., NOVEMBER, 1911 No. 1

COMING SHOWS AND THOSE DIRECTING THEM.

Four Great Exhibitions, Each to Continue Two Weeks, With Equal Periods Devoted to Pleasure and Industrial Vehicles, Are Organized for New York, Chicago and Boston.

THE annual national exhibitions of motor cars to be held in New York, Chicago and Boston, always large and imposing, will be larger and more complete than ever before. In preparation for these displays the manufacfurers having space for exhibit are producing special machines and the latest refinements in body design. The shows will have a different tone than in previous years. Stock products will be shown, but more than ordinary attention will be directed toward specialization of the pleasure vehicles. This distinction, however, will not be noticeable as regards the industrial transports. The machines will be typical of the highest mechanical development and there will be exploitation of construction designed for special service, for it is realized that there is a demand of almost unlimited proportions with variance for almost every individual requirement.

Col. George Pope of Automobile Board of Trade Show Committee.

The exhibitions will be more extensive than ever before, from realization of the transitory condition of the industry and the endeavors of the builders to make adaptations to the additional needs. The shows will have a different aspect from the viewpoint of the agent, and visitors will be impelled by business motives rather than by curiosity or by social ambitions.

Naturally the show that has an unusual measure of attractiveness from the fact that it is located in the commercial centre of the nation will take place at Madison Square Garden, New York, beginning Jan. 6, under the direction of the Automobile Board of Trade, and will be continued for two weeks, the display to be begun Jan. 15 to be of industrial wagons only. During this entire period there will be exhibition by the Motor & Accessory Manufacturers. The show committee is Col. George Pope, Alfred Reeves and Merle L. Downs.

The second exhibition will be at the Coliseum and the First Regiment armory at Chicago under the direction of the National Association of Automobile Manufacturers and the management of S. A. Miles. At this show there will be practically the same exhibits of cars as will be seen at New York, and the pleasure vehicles will be seen the first week, beginning Jan. 27, and the second week, beginning Feb. 3, there will be the power wagon display. The exhibitors of accessories will be much the same as will be seen at New York.

The annual Boston show, which is always the largest in America, will be in two periods, the first for pleasure cars, to be begun March 2 and concluding March 10, and the second for industrial wagons, to be begun March 13 and ended March 20. This will be somewhat at variance with the conditions obtaining with the other shows in that the exhibits will in many instances be made in the names of the agents, but the accessories will be practically the same as at New York and Chicago. This will be under the general management of Chester I. Campbell.

Obviously there will be at all of these shows displays of accessories made for but one week, and very generally there will be a sufficient number of withdrawals so that all of the members of the Motor & Accessory Manufacturers, Inc., may make display.

The fact that Madison Square Garden is not large enough to meet the requirements of those who would show machines brought about the organization of a second metropolitan show, this under the direction of the National Association of Automobile Manufacturers, which organization has been for years the moving spirit of the Chicago exposition. This show will be made at the Grand Central Palace, the new structure which will be utilized for an exhibition of this character for the first time, and which will be under the direction of S. A. Miles.

This Grand Central Palace show will be large and it will not suffer by comparison with the Madison Square Garden exhibition. The date for this will be Jan. 10-17, inclusive. It will differ with the Madison Square Garden show in that both pleasure and industrial machines will be shown.

COL. GEORGE POPE.

Col. George Pope of the show committee of the Automobile Board of Trade, formerly treasurer of the show committees of the Association of Licensed Automobile Manufacturers, has probably been more closely and longer identified with these committees than has any other man. The financial administration of the exhibitions has always been the work assigned to Col. Pope, whose judgment has been regarded as an important factor in the conduct of the shows. Col. Pope has for years been treasurer of the Pope Manufacturing Company and other large interests, and he has been identified with the automobile industry since its transition from the production of the bicycle. Incidentally, so far as the motoring world is concerned, Col. Pope is also associated with a number of manufacturing enterprises more or less allied with motor vehicle production.

The prestige of former exhibitions, all of which have been successful from every point of view, is one reason for keen anticipation by the industry of the coming show, and, it being in all probability the last that will be held at Madison Square Garden, it is regarded with a considerable degree of sentiment, aside from its value commercially. And naturally the display is looked forward to as certain of being very productive. For the success of the display much dependence is placed upon the committee and the energy and resourcefulness of its members.

From Left to Right: Samuel A. Miles, Directing Grand Central Palace and Chicago Exhibits; Alfred Reeves, Member Automobile Board of Trade Show Committee; Chester I. Campbell, General Manager Boston Display.

SAMUEL A. MILES.

The exhibitions at Chicago have been generally conducted under the direction of the National Association of Automobile Manufacturers, and supervision of Samuel A. Miles, and he will again manage the forthcoming show in the Windy City. Mr. Miles however, who has had some experience with metropolitan displays, will also direct the exhibition to be made at the Grand Central Palace, this making him the executive of shows in the two largest cities of the country. Mr. Miles has been general manager for the National Association of Automobile Manufacturers and with his experience with previous displays and his knowledge of the industry there is expectancy that the shows under his supervision will this season surpass all previous expositions. The Chicago shows for several years have been held in two separate buildings, and with two weeks for the exhibition to come, the direction of it presents problems that are unusually complex. Mr. Miles believes that the Chicago show will be the largest from every point of view and the most productive in the history of the organization. The only limitation is lack of space to meet the demands.

CHESTER I. CAMPBELL.

Every exhibition of motor cars made by the organized agents and dealers in Boston has been with the supervision of Chester I. Campbell, secretary of the Boston Automobile Dealers' Association. The first show organized by the trade, Mr. Campbell was secretary of the show committee and he continued as such until he was made general manager and placed as executive of the organization which required all of his time and attention, for there is no more notable exhibition than that which is to be seen at Mechanics' Hall building. Mr. Campbell gained his initial experience as manager of bicycle shows and when he took up the Boston organization it was with a purpose of making it a buyers' exhibition. The result has been that it is expected to develop more business with private owners than any other held in America. Each year the Boston show has been charming from the point of decoration and Mr. Campbell has always created what has been appropriate, artistic and effective as a setting for the cars. It is expected that Mr. Campbell will produce what will be in keeping with past exhibitions and be even more pleasing and interesting. Mr. Campbell has always been burdened with applications for more space than he has been able to grant. The coming show will be somewhat relieved by the division of the cars, but both departments will be full and complete.

ALFRED REEVES.

Alfred Reeves, sales manager of the United States Motor Company, formerly general manager for the Association of Licensed Automobile Manufacturers, and of the American Motor Car Manufacturers' Association, is associated with Col. Pope and Mr. Downs in the show committee of the Automobile Board of Trade. Mr. Reeves was the executive of the exhibition organization which conducted the majority of the displays at the Grand Central Palace until the dissolution of the American Motor Car Manufacturers' Association, and later with the licensed group of manufacturers, and his knowledge of the trade and industry and the requirements of the people who support motor vehicle shows has been especially valuable in the preparations making for the Madison Square Garden exhibition. Mr. Reeves has been exceedingly successful in whatever he has undertaken and with his experience and associates there is abundant reason to believe that the coming exhibition will be the most successful that has ever been held in the historic arena.

MERLE LEACH DOWNS.

Merle L. Downs, Secretary of the Show Committee of Automobile Board of Trade.

The man most experienced with the conduct of metropolitan motor vehicle shows is Merle Leach Downs, secretary of the show committee of the Automobile Board of Trade, which organization succeeded the Association of Licensed Automobile Manufacturers. Mr. Downs was a member of show committees of the old body and was associated with the majority of the organizations conducting the Madison Square Garden exhibitions as committeeman or secretary. His knowledge of the trade is intimate and his experience in a secretarial capacity with the shows has specially qualified him for the position he now holds. Mr. Downs entered the industry in November, 1899, and during the past dozen years has been identified practically with one concern, save during the time he was associated with the executive staff of the Association of Licensed Automobile Manufacturers. One of the reasons for the success of the Madison Square Garden exhibitions has been the admirable organization controlling them, the preparations being made so thoroughly and carefully that each has been more satisfactory and complete than that immediately preceding it. As secretary of the show committees for several years Mr. Downs has been largely responsible for these results.

The new plant of the Herreshoff Manufacturing Company in Woodward avenue, between Belmont and Trowbridge avenues, Detroit, Mich., is so far advanced that it will be started with its complete facilities about Dec. 15. This plant is exceptionally well planned and in many respects is model, this applying to design, lighting, heating, ventilating and other details essential to fullest production.

The American Automobile Manufacturing Company, New Albany, Ind., is planning increased facilities for the continuation of its present line of pleasure cars and for the construction of several models of light and heavy power wagons. George H. Wilson of Louisville, Ky., has succeeded Berton B. Bales as president of the company.

The new factory of the Victor Motor Truck Company, near the tracks of the New York Central railroad, at Buffalo, N. Y., was ready for occupancy Nov. 1, the company having made preparations to vacate the building in Niagara street that has been utilized since its organization. The equipment of the new plant is very complete.

DeLISSER RECEIVES TESTIMONIAL.

Horace DeLisser, Vice President United States Motor Company

In appreciation of his excellent work, up-building the Ajax-Grieb Rubber Company, Trenton, N. J., maker of Ajax tires, as well as his personal interest in all the employes, the directors and department heads of that concern recently tendered a dinner to Horace De Lisser, formerly president of the company and now vice president of the United States Motor Company. During the evening a handsome gold watch was presented to Mr. DeLisser by President William Grieb of the Ajax concern, on behalf of the employes of his company. Among those present, besides the guest of honor were: Benjamin Briscoe, Frank Briscoe, R. A. Pattison, J. C. Matlock, R. DeLisser, Louis P. Destribats, Harold W. Simpson and Samuel E. A. Stern.

The new buildings which will increase the capacity of the Ford Motor Company, Detroit, Mich., practically 100 per cent. will be completed by the first of December unless unexpected delay eventuates.

The Lord Baltimore Motor Car Company, Baltimore, Md., has under consideration a proposal to remove its factory to York, Penn.

The Howard Automobile Company, Jackson, Mich., has perfected plans to remove its factory to Macon, Ga., where a $200,000 plant is being erected for its occupancy.

The Hupp Corporation is building a new factory and power house at Lycaste street near the Michigan Central railroad, Detroit, and work is being rushed to close the structures before cold weather.

A one-story factory is building at Cedar Rapids, Ia., which will be utilized by the Hawkeye Auto & Carriage Company, a corporation organized by W. Morgan, D. Stofflet and G. C. Schneider, to build trucks from designs by Mr. Schneider that are to have several original features.

The Lion Motor Car Company, Adrian, Mich., has purchased land adjacent to its factory and purposes to erect buildings to increase its manufacturing facilities so that it may produce from 1000 to 1500 cars for 1912 if conditions justify such production.

A property of seven acres has been purchased by the Hupp Motor Car Company at Mount Elliott and Milwaukee avenues, Detroit, Mich., and plans are making for the construction of a factory that will increase the capacity of the present factory 200 per cent.

The Hudson Motor Car Company has begun building a steel and concrete two-story structure 530 by 60 feet, which will give 63,600 square feet of floor space, in connection with the factory in Jefferson avenue, Detroit, Mich. The work will be completed by the first of the year.

SAMUEL McKNIGHT BUTLER.

The automobile industry would be remiss indeed if it failed to realize the loss sustained in the death of Samuel McKnight Butler, chairman of the contest board of the American Automobile Association. None but those who have attempted to administer the laws of sport can conceive the burden that such a position entails, particularly in motoring, where features of trade enter into the consideration of every problem. Mr. Butler filled the office with credit to himself and the conflicting interests which he served.

A graduate from the bicycle ranks, he became one of the organizers of the Automobile Club of America, being at first its assistant secretary and later secretary for 10 years. He also was secretary of the first automobile trade association, formed some 11 years ago. His connection with the former club was such that his remarkable ability in organizing and promoting various shows and contests was brought into play. When the Manufacturers' Contest Association formed an alliance with the American Automobile Association in the matter of conducting motor car races and other contests, Mr. Butler left the Automobile Club to become chairman of the contest board. This was two years ago, and since that time he had had much to do with formulating the rules and regulations which governed this phase of the industry. In filling this office, he performed his task with rare good judgment, and assisted materially in the advancement of true sportsmanship, not forgetting the best interests of all concerned. He deserves the grateful remembrance of a wide circle of friends, who will mourn his death as untimely, particularly as his work had not been completed, fully. His place will be hard to fill.

The Late S. M. Butler.

Mr. Butler was born in Camden, N. J., Dec. 30, 1866. He was a veteran of the Spanish War, having served in the Signal Corps. He was interested greatly in the science of aerial navigation and in November, 1906, made a balloon flight from Pittsfield, Mass., to Long Island Sound. During the international aviation meet at Belmont Park, Long Island, in 1910, he served as one of the officials, representing the Aero Club of America, of which he was a member. His home was in Brooklyn, N. Y., where he is survived by a widow and two daughters.

L. H. Morrison, formerly of Indianapolis, Ind., is at the head of an American syndicate that is negotiating for a site for a motor car factory to be established either at the City of Mexico or Monterey, Mexico.

A steel and brick building for a stock and assembling room is being erected in connection with the plant of the J. I. Case Threshing Machine Company at Racine, Wis., which will be ready for occupancy early in the new year.

The Wichita Machine Company, Wichita Falls, Tex., is equipping a factory in that town for the building of power wagons.

The property of the Schurmeier Motor Company at St. Paul, Minn., has been purchased by H. H. Bigelow for $41,000, this being an investment only. No disposition of the plant has as yet been made.

A property at Grosse Pointe, Mich., with frontage of 283 feet, has been purchased by Howard E. Coffyn, president of the Hudson Motor Car Company, for a price said to be $40,000. The utilization of the property has not been announced.

A five-ton truck is to be built by the Teel Manufacturing Company, Medford, Mass., a concern that has been well known for years as a manufacturer of tops and wagon specialties. The machine will be known as the Teel.

A three-story and basement building 758 by 78 feet is to be erected by the Olds Motor Works, Lansing, Mich., which is to be used for assembling purposes, and which will increase the capacity of the plant about 50 per cent.

The motor department of the Corbitt Buggy Company, Henderson, N. C., has been taken over by the Corbitt Automobile Company, which has been organized with capital of $200,000, and which will produce pleasure cars.

The Lippard-Stewart Motor Car Company is now located in the plant at Buffalo, N. Y., formerly used by the Thomas Taxicab Company. The Lippard-Stewart company builds power wagons of 1500 pounds capacity for delivery and municipal department service.

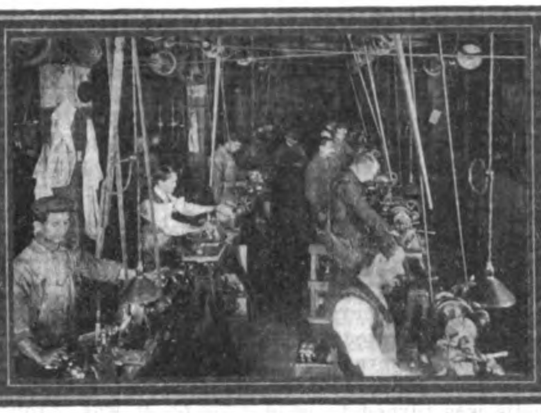
A factory that is planned to have a manufacturing capacity of 3000 cars a year is to be built on a site purchased at Windsor, Ont., by the Hupp Motor Car Company of Detroit, Mich., work having already begun. The production of this plant will supply the Canadian trade.

The Lockwood-Ash Motor Company, Jackson, Mich., has acquired the Never-Miss Spark Plug Company, Lansing, Mich., and will remove the plant to Jackson, where a new factory, 80 by 80 feet, of two stories, will be occupied. The head of the concern is W. L. Ash, for eight years executive of the Never-Miss Spark Plug Company.

The four-story 400 by 300 feet concrete addition to the plant of the Willys-Overland Company at Toledo, O., is well along toward completion, but this large increase in manufacturing facilities will not cause the removal of the Indianapolis factory to Toledo. This transfer will not take place for a considerable length of time, although consolidation is the policy of the company.

Power wagons will be built by the Schacht Motor Company, Cincinnati, O., in the Tilden-Jackson Typewriter Company's plant at Hamilton, Ont. A Canadian company has been organized to conduct the business, of which Thomas P. Rolph, Toronto, is president; T. H. Schacht, Cincinnati, vice president; Gerard Muntz, Toronto, treasurer, and J. S. Innes, Toronto, secretary and sales manager.

A model factory in every essential is to be built by the Kline Motor Car Company on a tract of 15 acres of land at Richmond, Va., recently purchased. The property will have spur track facilities for shipping and receiving. The entire machine equipment will be removed from the present factory at York, Penn. Work will shortly be begun on the new buildings.



MAGNETO MANUFACTURE A SCIENTIFIC PROCESS

Study of Methods in a Leading American Factory Discloses Interesting Operations Incidental to Producing These Instruments in Quantities. Improved Processes Make Large Output Possible Without Sacrificing Quality of Product.

BY

VICTOR W. PAGE, M. E.

The reader of motoring subjects often considers the modern motor car in its entirety, but those more familiar with progress made in automobile construction know the mechanism is an assemblage of many distinct components, each of which represents the endeavors of different engineers and designers seldom considered in connection with creating the complete vehicle. While many manufacturers claim to construct the car entirely in their own shops, there is a tacit understanding in the industry that some components can be purchased from specialists in their production much cheaper than the motor car builder could construct them, even if possessed of the highly specialized skill and experience necessary to create and manufacture the various parts successfully.

The progress in motor car development for several years has been mainly in refining the details and accessory components, as the internal combustion engine, reflected in the forms in use for some time, may be justly regarded as having reached a point of practical serviceability, and the recent types may be said to incorporate practically all of the features desirable. The greatest progress has been made in developing the auxiliary components of the engine, and only one who is fully conversant with the vagaries of gasoline motors can appreciate the importance of having these very necessary groups function properly. Among the adjuncts used in connection with a hydrocarbon engine, there is none that has more important bearing than the ignition system, and the decrease in efficiency which follows when inefficient or imperfect electrical apparatus is employed is too well known to require comment.

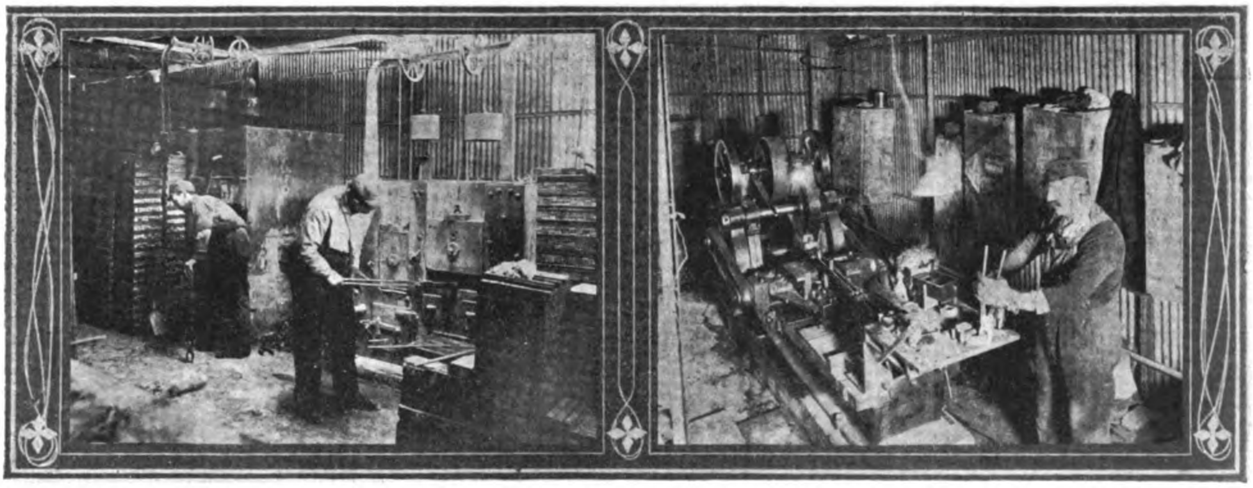
One of the most important steps in developing the practical and efficient internal combustion power plant has been the general adoption of magneto energy as a source of ignition, greatly simplifying the apparatus necessary to fire the charge in the engine cylinders. The advantages of magneto current production have been dwelt upon at length in previous issues of our publications, and may be summed up easily in very few words. The ignition is positive and unfailing; the intensity of the spark remains always the same, regardless of length of service; the apparatus is extremely simple and reliable and in the case of a multiple cylinder engine, the spark timing is synchronous in all cylinders. This makes for easier running, better balance and economical operation. That these advantages are now well recognized is best exemplified by the general use of this device even by people who have previously looked upon it with suspicion.

Many firms are engaged in producing magnetos and a number have attained an enviable reputation for excellence of product, but the average motorist seldom appreciates the magnitude of the industries thus employed, or the equipment and careful processes necessary to insure accuracy of finish coupled with quantity production. To properly understand the completeness of the equipment and the splendid facilities that obtain for the rapid and accurate production of interchangeable parts, one should visit a representative manufactory engaged in making such apparatus.

Among the pioneer makers of complete ignition systems, the firm of C. F. Splitdorf, operating several factories in New York City, is prominent, and it has manufactured electric apparatus for so many years that the product is regarded as standard. The magneto developed by this company has a very wide sale all over the world, and is produced in very large quantities, so a review of the methods in vogue at this complete and representative manufactory cannot fail to give the motorist a better understanding of the many steps necessary to produce an enduring and efficient device.

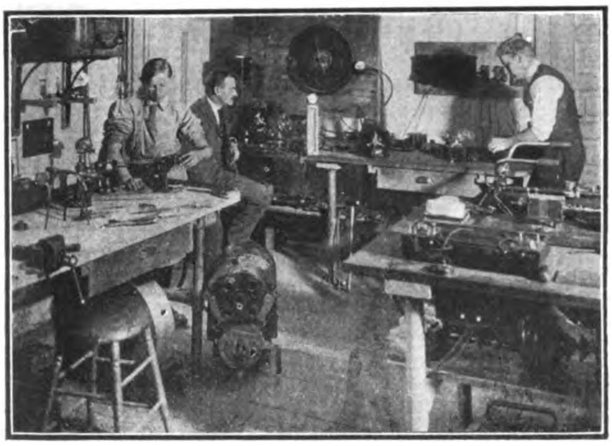
Modern Manufacturing Methods Insure Quality.

The value of systematic production in insuring uniformity of product is well recognized by engineers, though it is not always apparent to the layman, and



To Form the Magnets, Straight Bars Cut to Proper Length Are Heated in Furnaces Shown at Left, and Bent When Proper Temperature Is Reached, in Powerful Forming Press Known as "Bulldoser," Depicted at Right.

in no plant producing the same character of devices is this better exemplified than in the factory under discussion. A mechanic passing through the plant would appreciate the improved processes of machining components, and the special fixtures and gauges that insure the production of accurately finished parts in quantities. The number of operations through which the pieces must pass is not readily grasped by those without mechanical training, and the casual observer would be apt to think that some of the many inspections or niceties in machine work were unnecessary. On more careful consideration it will be apparent that every examination, while increasing the manufacturing cost, is positive assurance of excellence of product. The writer was very favorably impressed with the manufacturing system prevailing at this plant, the careful workmanship and thorough oversight making clear the enviable reputation and satisfactory service of the product.



Well Equipped Experimental Room in Which Splitdorf Ignition Devices Are Perfected Before Marketing.

New as the factory and equipment are, the Splitdorf laboratory is one of the real pioneers of the automobile industry. It was founded in 1858 by Henry Splitdorf, the father of the present manager, to carry on experiments connected with projected improvements in telegraph instruments. The great problem in those days was to reduce the time required in sending messages long distances. This Henry Splitdorf accomplished by inventing a repeating relay that eliminated the older method of having operators repeat the messages every few miles, and the time consumed in transmitting a message from New York to Chicago was reduced from five hours to as many minutes. As the Western Union Telegraph Company needed a large number of these instruments, a factory was established and the manufacture was continued for several years.

How Factory Was Started.

When the Roentgen or X-rays were first discovered, the manufacture of Rhumkorf coils, which are the same in principle as those at present used for ignition, was started and many were sold to the medical profession and experimenters. The requirements of the first electric ignition systems of the high-tension type were the same; a high potential current must be utilized to ignite the charge in the cylinder of the gas engine, and the simplest method of obtaining it was to use a transformer of the "step up" type and change direct current of comparatively low voltage, such as generated by small dynamos or chemical batteries, to alternating impulses of higher potential. The experience obtained in building the larger X-ray coils was turned to good account, it was through the wide distribution of the Splitdorf ignition coils that the name became so well known.

Tester Determining Strength of Finished Magnets Before Sending to Assembling Room.

From this small beginning, the present enormous business expanded as the automobile industry grew stronger. In 1885, Charles Splitdorf assumed the management of the business which the founder relinquished because of advancing years, and the firm was soon forced to expand to satisfy the demand existing for the ignition coils. In 1889, the younger son, John, became interested in the business and the laboratory at 17 Vandewater street was established. It continued at this location until 1907, when, having greatly outgrown its quarters, the entire establishment was removed to a splendid new building at 261-265 Walton avenue, the Bronx. The constantly in-

After Magnets Are Formed, the Ends, Sides and Inner Faces Are Ground to Fit Pole Piece Assembly as Shown at Left; When Machining Is Complete, and After Hardening, the U Bars Are Magnetised in Solenoids, Outlined at Right.

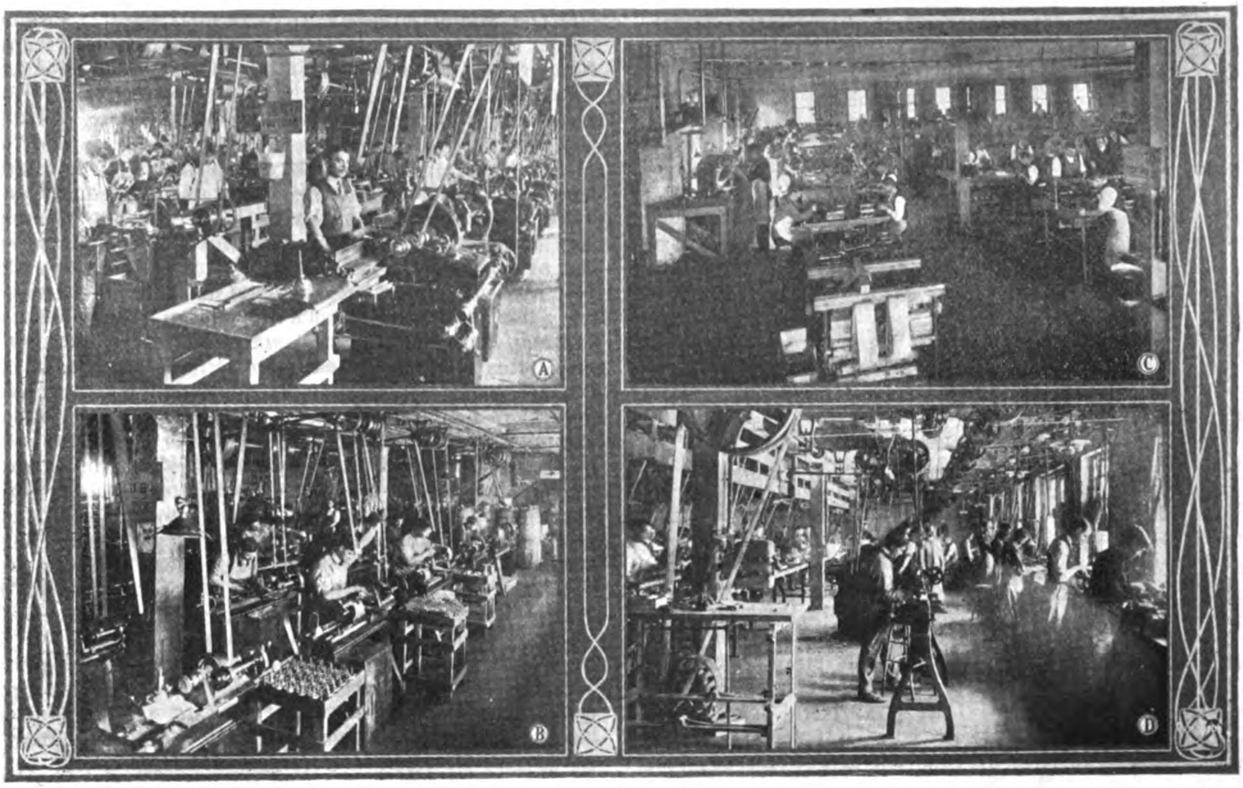
LIBRARY OF THE UNIVERSITY OF CALIFORNIA

creasing business has rendered even this great plant inadequate to supply the demand and to this end, a large factory was secured for an overflow. The largest plant is devoted exclusively to magneto production, the other establishments are used to manufacture the smaller ignition specialties, such as coils, switches, timers, plugs, etc., and for offices and experimental work.

Producing Components in Quantity.

It is not possible to go into details regarding many interesting processes to be seen at this factory as lack of space prevents a complete exposition of manufacturing methods. The writer will mention only those steps that interest the lay reader, and some of the most important operations are made clearer by the very complete set of illustrations accompanying this article.

The arrangement of the building, which is of six stories and basement, is such that the heavier machinery is on the lower floors, the finishing and testing being carried on with lighter machinery on the upper ones. The progression of the raw material, which enters the factory at the basement, is the same as in all modern manufacturing establishments, the endeavor being to minimize the number of handlings, and to reduce the stock to small pieces or finished components as quickly as possible.



Busy Rooms at Splitdorf Plant—A, Grinding Machinery; B, Gear Cutting Department; C, Assembling and Testing Floor; D, Where Ball Bearing Races are Produced.

All stock entering into the construction of the Splitdorf product is of domestic origin, and the magneto is said to be a strictly all American product. It is manufactured in its entirety at the plant of the company, which is making everything, even to the ball bearings, a component usually produced by specialists.

All materials are carefully tested and inspected on receipt and the rough stock room contains tons of material in many forms and for many uses. One sees steel and brass rods, copper and iron wire, aluminum, copper, brass and iron sheets, castings of aluminum, iron and bronze and bins filled with small rubber composition parts or stampings ready for machining. To insure uniformity of product and to see that the material possesses the required qualities, samples are selected from every lot received and subjected to exhaustive tests to determine if the chemical composition and physical properties conform to the high standard established.

In the tour of the various departments many interesting and distinctive processes were noted, a large part of these having been originated by the engineering department of the company, and shown the writer only in strict confidence. Many thousands of dollars are invested in special jigs and templates and some of the machinery used has been produced in the tool shop at a great expense, and after much experimentation.

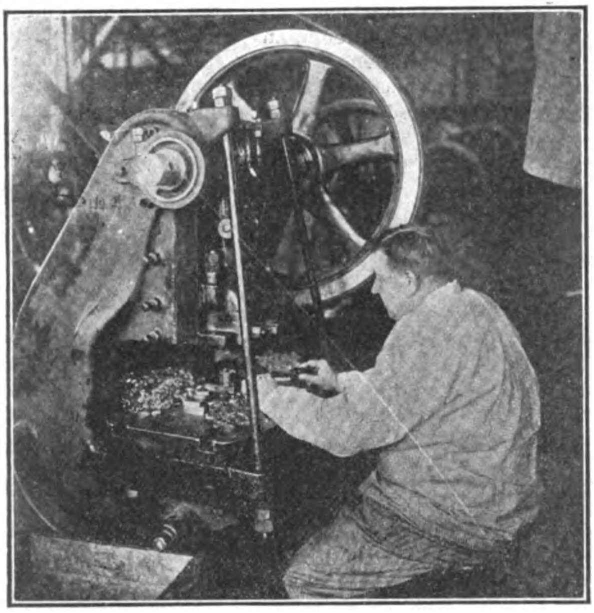
Machine Tool Equipment Very Complete.

As is true of other mechanisms, the modern magneto is composed of a large number of distinct parts, the production of which involves considerable labor. Some of these must pass through many processes before assembling. All of the power tool equipment is by the best makers and the accuracy and finish of the work turned out cannot be excelled. Screw machines and turret lathes are as common as engine lathes in the average factory. Grinders, milling and gear cutting machinery and hundreds of engine lathes are also employed in the various departments to machine the parts. The lathe equipment is most complete, ranging from the small jeweller's bench lathes, in which the small ball bearing races are ground, to the massive turrets and automatic screw machines. Multiple spindle, sensitive and back geared drill presses are seen in infinite variety, as well as boring machines and special machine tools developed to meet the specific conditions existing at this plant.

If a part can be produced more accurately or at less expense with a special machine or fixture, this is immediately constructed, and many machines, when once set to perform a certain operation are never changed to other work. High speed tool steel is used throughout for all machines and while cutters of this material are expensive, it is possible to remove more material a unit time than with the ordinary tool steels, and tools of this material keep their edges longer. All tools are under constant supervision and the finished parts are carefully inspected to make sure that neither the tool nor the template is worn enough to introduce an element of error.

Thousands of Parts Needed Daily.

As an example showing the completeness of the equipment, all of the many small screws used are manufactured from the bar by automatic screw machines of the latest pattern, some of which produce as high as 6000 of these small components daily without any other attention than renewing the bars of metal and keeping the tools in condition to do their work accurately.



Power Presses Produce Hundreds of Small Parts Direct from Sheet Metal.

In the construction of ignition appliances, many small parts are employed that can be formed from the sheet, and for this work, there are power presses that stamp them out as fast as the stock can be fed between the hub and die employed to form them. By changing the shape of the dies employed many different parts can be made on these machines, these replacing parts formerly produced by casting, making for lighter, cheaper and simpler construction.

The number of small parts used cannot be appreciated by those not versed mechanically, but as an example, in such a relatively simple device as a magneto or battery switch there may be nearly 35 distinct pieces in the assembly. The even simpler contact breaker housing cover has 12 distinct pieces. The importance of producing these small parts in quantity, but at the same time accurately, cannot be overestimated, and it is only by constant attention and close inspection that uniformity of production is realized.

Arrangement of Departments.

The various departments of the Splitdorf factory are well arranged and the different processes take place in a logical order. In the basement, the magnets are made, machined and magnetized. The screw machinery is on the first floor; some of the heavier boring and milling machinery is on the second; the medium weight machine tools used in gear cutting, turning and armature finishing are on the third. Armature winding and grinding machinery is not under heavy stress, and is installed on the fourth story. Above this, the various processes incidental to ball bearing manufacture and some light grinding are carried on, while the top, or sixth floor, is devoted to assembling the various components produced in the other departments, and testing the finished product.

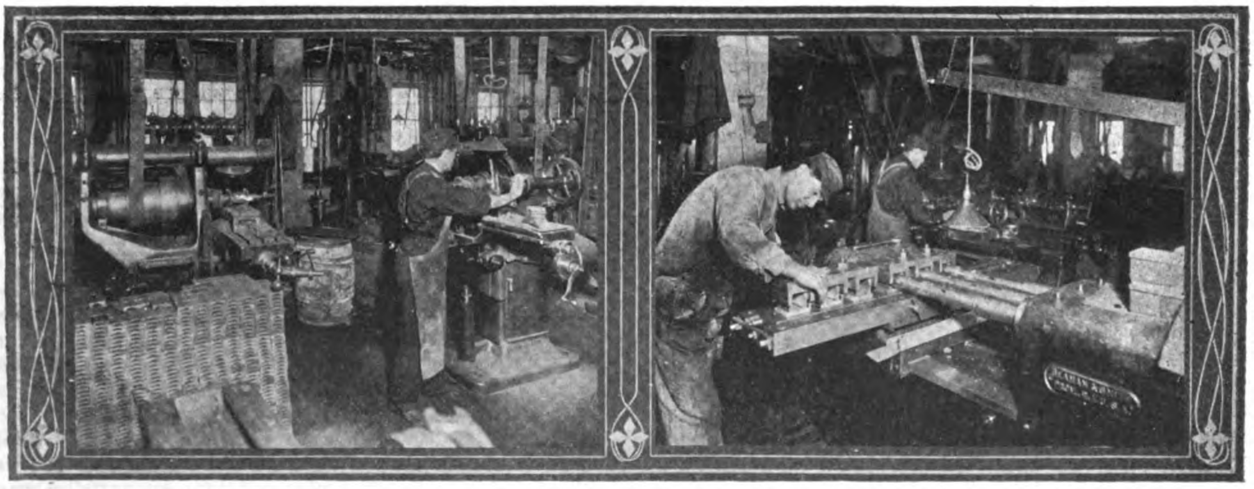
How the Various Parts Are Made.

A magneto may be divided into a number of groups, these varying with the type of instrument. For convenience, we will divide the Splitdorf magneto into the following assemblies: (a) The magnets, (b) the base assembly, including the pole pieces, the bearing ends and the base plate; (c) the armature, (d) the contact breaker, (e) the distributor. Besides these, there are other parts necessary to proper current production, the most important element being the transformer coil with which is incorporated the switch assembly, and the spark plugs which make possible the utilization of the spark in the cylinders.

The magnets are a very important part of any magneto, and it is largely upon their strength and endurance that the capacity of the instrument depends. The base piece serves to carry the bearings in which the armature revolves, as well as the pole pieces to which the magnets are fastened, and between which the armature revolves. The armature group includes the shaft, the core around which the wire is wound, the distributor speed reduction driving gear, and the timing cam. The contact breaker includes the housing, the insulated platinum contact screw and the grounded contact lever, which carries the other contact point and which is operated by the timing cam on the armature shaft. The distributor assembly comprises the collecting and distributing brushes, the large distributor speed reduction gear, the distributing segment, the distributor shaft and its bearings, and the high-tension terminals from which the current is led to the cylinders.

Magnet Making Exacting Process.

Considering first the process of making magnets, one of the most interesting involved in magneto production, one can form some idea of the amount of work involved in making even such a relatively simple part as a horseshoe magnet. The bars of special steel



Pole Pieces of Cast Iron Are Finished on Two Sides and Outer Face in One Operation with Multiple Milling Cutters as Depicted at Left; the Special Machine Utilised in Boring Three Base Assemblies Simultaneously Is Clearly Shown at Right.

are first cut in heavy shearing machines to the required length, and then taken to the forming room, where they are placed in large Brown & Sharpe coal burning furnaces to heat them prior to forming. The temperature of these furnaces is maintained at a uniform point by careful stoking, the degree of heat being easily determined by pyrometer indication.

After the bars have been heated to the desired degree, they are removed from the furnace and placed in the "bulldozer." This is a large horizontal forming press, consisting of a movable member reciprocated by heavy cranks moved by large gears. At the end of these the male member of the forming tool is carried, while the female member or die is attached to the bed of the machine. When the bars are properly placed, being fed up to a gauge, the power is turned on and the sliding frame carrying the hub drives the bars into the die, which is shaped like the outside of a magnet, while the hub conforms to the inside contour. Two magnets are formed at the same time; one inside and one outside member. After the bent bars are removed from the die, and while still hot they are placed between the jaws of a clamp at the end of the machine, where the ends are bent in slightly. The magnets, which are still at a high temperature, are placed in and covered with lime to cool, the object being to reduce the heat slowly and thus avoid air hardening.

After cooling the magnets are allowed to age for a certain time, and are then machined. This involves drilling the holes in the sides for taking the screws by which the magnets are attached to the base assembly, and grinding the ends, sides and inner faces so they will fit closely against the pole pieces without air space to reduce the intensity of the magnetic energy passing from the magnet to the pole members. When the bent bars have been machined, they are hardened prior to becoming magnetized, because hard steel remains magnetized longer than soft metal, and the capacity and endurance of the magneto depends largely upon the degree of retentivity the hard steel has acquired.

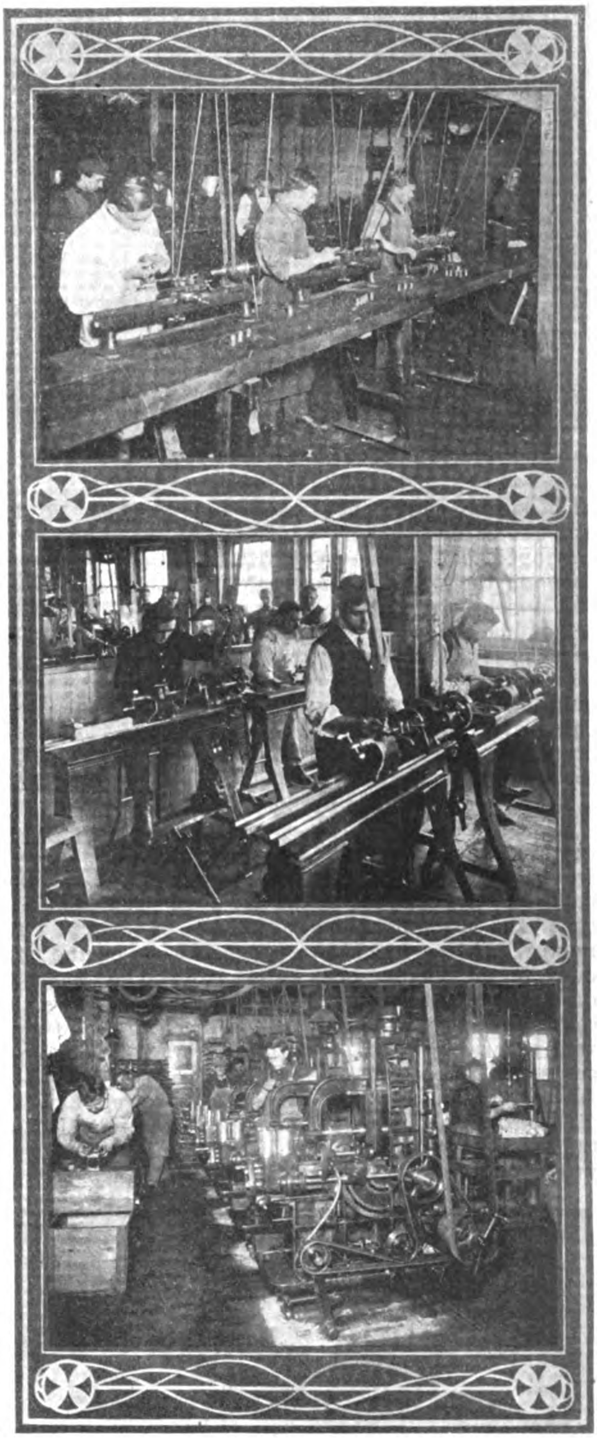
How Magnets Are Energized.

The process of hardening is a special one and is very carefully carried out, having been developed after considerable experiment. The method of energizing the magnets is simple, these being thrust in solenoids, protected by heavy brass cases, through which a direct current of electricity is passing. A solenoid is a coil of wire without a core, and if a bar of iron or steel is placed in one through which a current of sufficient intensity is flowing, it will become a magnet. The magnets are hard, and therefore retain the magnetism; if they were soft, they would soon become demagnetized. This is known as magnetization by induction. After this the magnets are allowed to age, and are magnetized again. Before being sent to the assemblies they are tested, and all that have become weak in a given time are discarded. After the final test, they are painted black to protect them from rusting, and go to the assembling room.

How Base Pieces Are Machined.

The various parts of the base are machined separately on the different faces and are joined together before the pole pieces are bored to receive the armature. The pole pieces, which are cast iron, are smoothed on a special miller with three cutters, so the top, bottom and back have always the same relation to each other when the operation is complete. The holes are then drilled and tapped to receive the screws holding them to the brass base piece and the base is assembled. The method of machining the pole pieces is shown in accompanying illustration.

After the pole pieces are firmly attached to the base, they are placed in a special boring machine with a sliding carriage and three boring bars. While the boring bars are machining one set of three base assemblies the workman is putting three other bases in the special fixture made to receive them. When the cutters have completed the bore in one set, they are backed out, the carriage is shifted, and the other set is machined while the attendant removes the finished parts and replaces them with partially finished members. As all faces of the template are absolutely smooth, as well as the sides of the base assembly, it is possible to bore these very accurately.

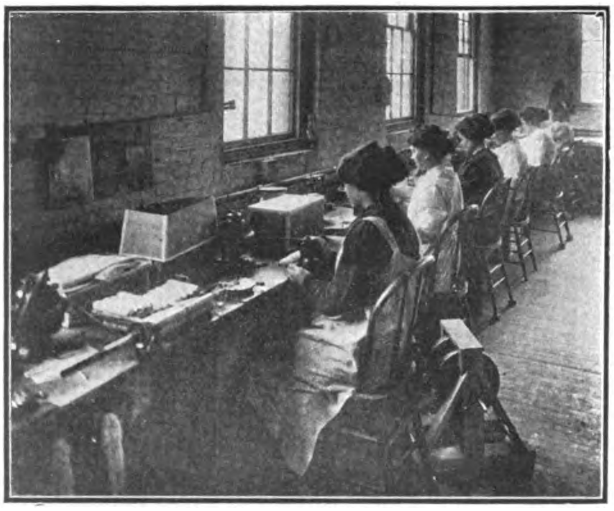


Some of the Operations Requiring Careful Manipulation: At Top, Workmen Winding Armatures; at Centre, Grinding Ball Bearing Races in Delicate Lathes; at Bottom, Gear Cutting Machinery at Work on Distributor Driving Gears.

Some Operations in Armature Construction.

The armature is assembled from wrought iron stampings and iron castings, the shafts are screwed in place, and the whole is turned to fit the bore between the pole pieces, so that a clearance of but 0.01 inch is permissible between the armature and pole members. The shafts are carefully ground after the assembly is trued up, and the outside of the armature is given its final finish by the same process.

When the machining is complete the armature is taken to the winding department, where it is placed in a special chuck in a small lathe, and the proper amount of wire wound on from a large spool under the operator's chair. Every bit of the wire passes through the winder's fingers, who is thus able to detect any break in either the continuity of the conductor or insulation. After winding is finished the armatures are tested for leakage, and if they pass this test satisfactorily the coils are saturated with insulating compound, wound over with a special nonconducting tape and firmly bound in place by a silk binding which fills an annular groove machined in the outer periphery of the armature.



Winding the Primary Coils of Transformers an Exacting Process.

Gear Cutting by Special Machinery.

The gear teeth are cut on special milling machines, the first process being to machine the blanks in lathes true on both sides, hubs and faces. They are then grouped on mandrels, 12 to 20 gears being cut at a time, the machine being automatic in action. The number of gears machined depends upon the size, more of the smaller ones being grouped on the mandrels. The small gears, called armature gears, because they are mounted on the armature shaft, are very accurately bored to fit this member. The larger gears are assembled on their shafts, and the whole assembly trued up. The insulating disc in which the distributing segment is imbedded is assembled on the large gear, and the face is trued up so the metal will be at the same height as the insulating material. All shafts are ground with great accuracy, as it is necessary that they fit the inner bore of the ball bearings closely.

The processes involved in making the bearings consist of forming the races and assembling. The blanks are rough formed on screw machines and are finished ground on special grinders. The faces are trued up on horizontal reciprocating magnetic chuck machines, the inner or bearing surfaces and outer peripheries of the races are ground in small lathes having constricting chucks and extremely high speed grinding wheels of very small diameter. These machines are very delicate, and are called upon to do extremely accurate work.

Finished Parts Are Assembled and Timed.

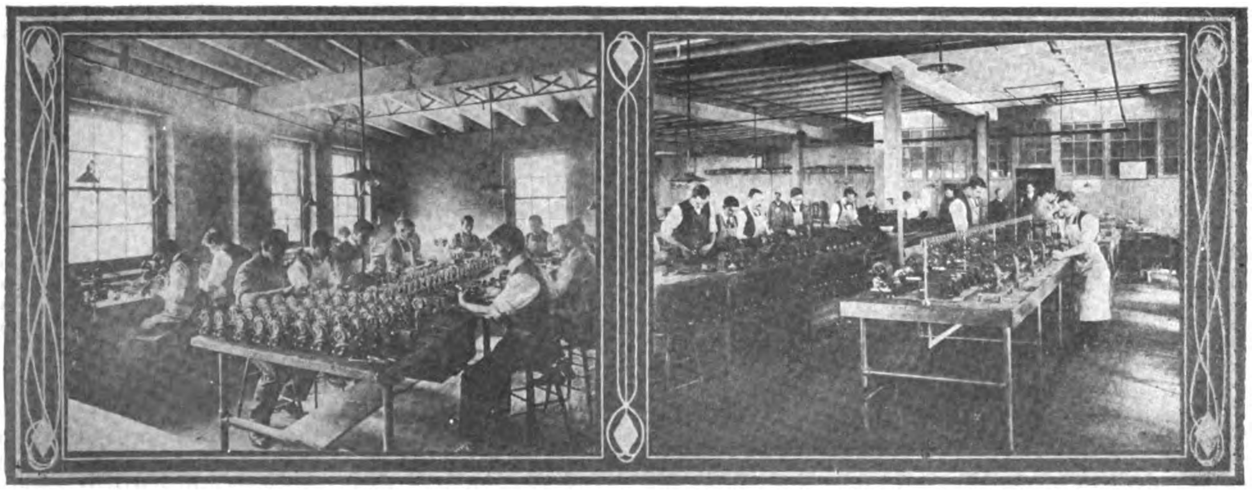
After the various groups are machined and many of them partially assembled, they are sent to the main assembling room where they are put together by expert workmen, thus forming the finished magneto. They are then timed and the contact points adjusted, and are placed on the testing benches and run by belt for some time to see that all parts are functioning properly.

While only a few of the important processes are considered, there are hundreds of other operations through which the parts must go before they reach the assemblers. After every operation, the components are tested with fixed gauges allowing very little variation under or over the size called for, and these testing fixtures and plugs undergo periodical inspection and settings are constantly verified to make sure they have not changed. It is only by constant attention to tools, templates and gauges that the proper standard of machine work necessary in magneto construction is maintained. The reason for absolutely accurate workmanship is not always comprehended by the layman, but its importance can be easily understood when one considers that a clearance of but 1-1000 of an inch more than necessary between the armature and the pole pieces may mean a loss of efficiency of 10 per cent., due to loss of magnetism because of the resistance of the air gap.

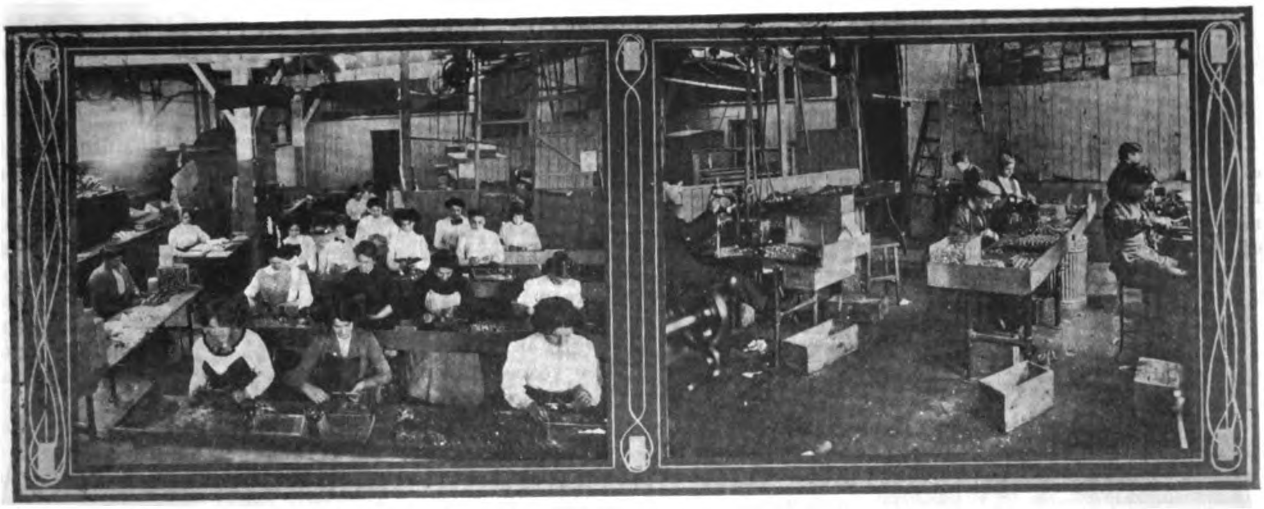
Coil Making Important Work.

As the Splitdorf magneto is a low-tension type, a transformer coil is needed to "step up" the current of small voltage to one of higher value. A separate building is given over to making coils and other small components, so this work does not interfere with the production of magnetos. The first step in construction is to wind the primary coil, which is done on small winding machines. The secondary coils, made of much finer wire are also produced by the same process. After winding, the coils are carefully tested. Passing this inspection they are impregnated with insulating material.

Meanwhile the other parts of the coils are being



When Magneto Parts Are Finished, They Are Assembled by Careful Workmen, as Shown at Left; Finished Product Is Timed, Adjusted and Inspected Before Shipment on Test Bench, Depicted at Right.



At Left, Operatives Are Winding Mica Sheets to Form Insulation of Plug Cores; at Right, Room in Which Components Are Assembled to Form Complete Spark Plugs.

assembled, these including the condenser and switch complete upon its composition plate, and are then sent to the assembling room with the windings. The whole is now placed in a wooden box, the various parts connected to each other and to the terminals by wires, all joints soldered, after which the box is filled with insulating compound to prevent loss of current. The finished coils are tested very carefully for defects.

There is considerable labor involved even in making such simple components as sparking plugs. The shells or bushings of metal are a screw machine product of steel, as are the central electrodes. These parts must be drilled to receive the irridio-platinum wire sparking points, and the central piece must be wound with mica. The operation is done by girls on small winding machines as shown in illustration. To assemble, the core is placed in its shell, then the outside insulation of porcelain is applied and the whole is screwed into the main bushing that screws into the engine cylinder. The plugs are carefully tested and the spark points separated the requisite distance and set to gauge. The finished plugs are then wrapped and boxed ready for shipment.

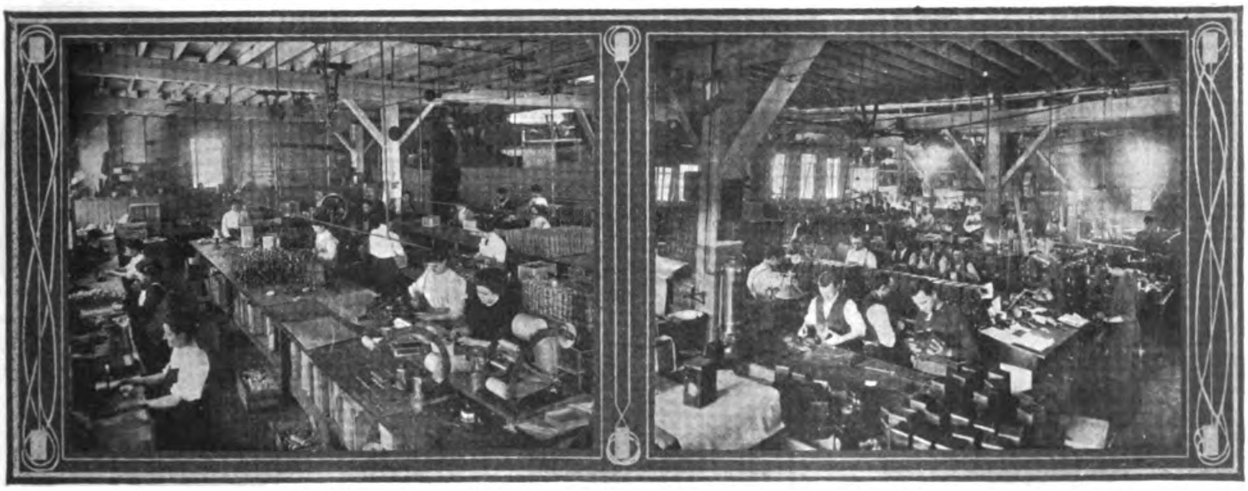
From the foregoing it will be apparent to those interested in automobiles or other self-propelled conveyances that many seemingly incidental or secondary parts are in reality the highly perfected product of as large an engineering and manufacturing organization as many engaged in producing motor cars. Such enterprises as the Splitdorf laboratory have grown to large proportions and produce apparatus upon which depends much of the efficiency of the engines to which they are applied. Not only this, when one considers the severe usage to which these apparently delicate instruments are subjected, it is surprising they endure as well as they do. It is evident there must be a high degree of manufacturing skill displayed that such components may be produced in large quantities.

RATTLE LOCATED IN THE MUFFLER.

A very annoying rattling was located, after considerable speculation, in the muffler. It was noticed that when the engine was stopped and the machine coasted down hill, the rattle ceased immediately. An investigation showed that some of the rivets holding a baffle plate in the muffler had dropped out allowing the plate to rattle.

NEW USE FOR OLD INNER TUBES.

Among the many uses to which old automobile tubes may be turned, after they have outlived their usefulness by reason of rim cuts, blow-outs, etc., is a cure for slipping belts in wet weather. Take a tube of 4.5 or five inches in diameter and slice a piece off crossways with a sharp knife, making rubber rings or bands exactly the width of the engine pulley. Then slip one of the bands onto the pulley. Although the tension of the rubber on the pulley will tend to prevent it from creeping, a little cement or shellac will hold the band firm. The friction of the belt tends to roughen the contact face of the rubber somewhat similar to the corrugations on the business face of a patch, and as the rubber is somewhat spongy and adhesive, the belt grips better and the water is squeezed out by the belt tension quicker than it would be from a leather or metal faced pulley.



Windings of Transformer Coils Are Prepared for Assembly in Room Shown at Left; the Various Components Are Grouped Together, Installed in Boxes, and Tested in Department Illustrated at Right.

WHO'S WHO IN THE INDUSTRY.

W. H. WHITESIDE.

W. H. Whiteside, who has succeeded I. H. Page as executive of the Stevens-Duryea Co., Chicopee Falls, maker of the Stevens-Duryea cars, has had a very wide manufacturing experience, he having been president of the Allis-Chalmers Co. of Minneapolis and Montreal previous to taking up the duties as head of this concern.

W. H. Whiteside, President Stevens-Duryea Company.

Mr. Whiteside has been for 30 years active in industrial production. He became associated with the Du Pont Powder Company, Wilmington, Del., in 1881, and in 1885 he went to the Cleveland, O., Electrical Manufacturing Company, where he remained for 12 years. He went to the Westinghouse Electric & Manufacturing Company as manager of its Washington, D. C., branch in 1898, and among other works he supervised the installation of electric power in the United States navy yards at Portsmouth, N. H., Boston and League Island, each an undertaking of more than ordinary proportions.

He went to the Allis-Chalmers Company in July, 1904, as general sales manager, and after practically a year's service as vice president and as general director of sales he was chosen president of the corporation. Mr. Whiteside is still a director of the Allis-Chalmers Company and is interested in the conduct of its affairs. Mr. Whiteside is widely known to the engineering fraternity, being a member of the American Society of Mechanical Engineers and of the American Society of Electrical Engineers.

WILL SELL EVERITT CARS.

Announcement is made of the appointment of Joseph E. Warren as chief of district managers for the Metzger Motor Car Company, Detroit, maker of Everitt cars. Mr. Warren is one of the best known and most capable trade experts in the industry, and has a wide sales experience in other lines as well. More than 20 years ago he was associated with the National Cash Register Company, in which capacity he won a large number of friends and acquaintances throughout the country. Subsequently, he became connected with the Chalmers organization, when W. C. Hood was sales manager.

Joseph E. Warren, with Metzger Motor Car Company.

As is well known, Mr. Hood is now occupying the position of sales manager with the Metzger company, and Mr. Warren will be one of his chief assistants. The business of the concern has increased so rapidly during the past few months, that it has been found necessary to increase its sales force very materially. Mr. Warren will prove a valuable addition to the Everitt force.

IMPORTANT RUBBER COMPANY CHANGES.

Both motorists and motorcyclists will be interested in learning that Fred I. Willis of Indianapolis, Ind., and G. H. Hamilton of New York, recently secured a large block of stock in the Kokomo Rubber Company, Kokomo, Ind. A reorganization meeting of the stock-

Officials of the Reorganized Kokomo Rubber Company: From Left to Right, D. C. Spraker, President and Treasurer; F. I. Willis, Vice President; G. H. Hamilton, Sales Manager.

holders was held early in the month, at which this announcement was made public. Mr. Willis becomes a vice president of the concern, and Mr. Hamilton sales manager.

Both men are well known in the industry. The former was president of the Federation of American Motorcyclists in 1909 and 1910, being succeeded at the Buffalo convention in July by Mr. Hamilton. He has held the position of secretary in the National Association of Cycle Jobbers since its organization, seven years ago, and it readily will be seen that his acquaintance is large. In addition, he was until recently secretary-treasurer of the Hearsey-Willis Company of Indianapolis. Mr. Hamilton formerly was eastern sales manager of a large rubber concern.

The Kokomo Rubber Company was organized several years ago by local men, and has been engaged in the manufacture of Kokomo bicycle, vehicle, automobile and motorcycle tires. The plant now covers eight acres and the concern employs 300 men. The newly elected officers are: President and treasurer, D. C. Spraker; vice presidents, Milton Kraus and Fred I. Willis; secretary, George W. Landon; superintendent, John Neary; sales manager, G. H. Hamilton.

Harry C. Stutz, Chief Engineer Ideal Motor Car Company.

Leslie B. Sanders, New Sales Manager Lion Motor Car Company.

Claude S. Briggs, President New Detroit Organization.

HARRY C. STUTZ.

The Stutz cars are the design of Harry C. Stutz, chief engineer and factory manager for the Ideal Motor Car Company, Indianapolis, Ind., who is one of the best known men in the automobile industry. Mr. Stutz is one of the pioneers, as he has built machines for more than 15 years. He was one of the organizers of the American Motor Car Company, and designed the first American car. He later joined the Marion Motor Car Company and for four years was chief engineer. The Marion cars built in 1908-9-10 were his design exclusively and were built under his supervision. The Stutz cars are the latest and best creation of a carefully developed and long experience, together with splendid material and high class workmanship and manufacturing facilities. Mr. Stutz is president and general manager of the Stutz Auto Parts Company, maker of the Stutz transmission and rear axle, which construction is used in the Stutz cars and has been adopted by a number of manufacturers.

LESLIE B. SANDERS.

Leslie B. Sanders, sales manager of the Lion Motor Car Company, Adrian, Mich., is the head of an organization which has been perfected for the purpose of making a very strong selling campaign throughout the country. Mr. Sanders was for a considerable period prior to joining the Lion company, sales manager of District B for the United States Motor Company, and before that was connected with several well known concerns.

Mr. Sanders has directed his energies toward broadening the market for the Lion machines, which he enthusiastically declares are the best produced for the price, and his selling force is carefully chosen with strong agencies in many of the commercial centres of the country. The productiveness of the company will be unable to keep pace with the demands if Mr. Sanders' campaign is as successful as he is sanguine it will be.

CLAUDE S. BRIGGS.

A concern that has not as yet been given a corporate name has been organized at Detroit, Mich., to manufacture a pleasure car that will be known to the industry as the Detroiter, and the head of this concern is Claude S. Briggs, who was the organizer, president and general manager of the K-R-I-T Motor Car Company, and who later and until recently was general sales manager of the Brush Runabout Company. Mr. Briggs has been actively identified with the motor vehicle industry for several years and became widely and favorably known. The new company has capital of $200,000 and it has practically completed plans for manufacturing 1000 machines during the year to come.

The Detroiter car will, as now planned, be of two models, the one a two-passenger roadster and the other a five-passenger touring car. These cars will have a power plant with long stroke motor that will develop 25 horsepower, and among the mechanical features will be the rear axle and brake constructions, which make for unusual strength and durability.

SAVING TIRE EXPENSE.

The United States Tire Company, New York City, is mailing a neat brochure which resembles a pocketbook filled with gold certificates. Each of these is printed in colors and bears an illustration of some vehicle fitted with one of the several makes of tires manufactured by the company. Many excellent reasons are set forth why a saving can be effected by utilizing its product.

PEERLESS BOSTON BRANCH A MODEL STATION.

MODERN methods of caring for the car owner include the location of thoroughly equipped service buildings in all large centres. In some respects, many of these are fitted better to look after the needs of customers than some automobile factories. It is one of the features of the industry to which much attention has been paid recently, and one in which the future will see many innovations and amplifications. In general appointments and careful attention to detail, the building of the Peerless Motor Car Company of New England at 660 Beacon street, Boston, is a model plant. Not only is the location well chosen, but the arrangement of the various departments is such as to facilitate rapid and satisfactory work. The entire establishment undoubtedly is one of the finest and most complete motor car sales and service stations in the country.

The structure has a 90-foot front on Beacon street, near the junction of Commonwealth avenue, and besides being in close proximity to Boston's fashionable residential district, is on the through lines of travel. The depth is 115 feet, and light is available on all four sides. The six stories and basement afford over 70,000 square feet of floor space.

The concern is a direct factory branch of the Peerless Motor Car Company, Cleveland, O., and looks after the distribution of Peerless cars throughout the entire New England district. The salesroom is on the first floor and measures 90 by 45 feet. Quiet refinement characterizes the fittings, the floor being finished in terazzo and mosaic, while the wainscoting is of mahogany. The furniture is of the latter material, the special design being such as to harmonize with the general scheme of decorations. Here the product of the company is best displayed for the inspection of the prospective purchaser. The present owner also is received courteously and prompt attention is paid to his wants or troubles as the case may be.

In the rear of this floor is the garage for demonstrating cars and the actual service department, devoted to the immediate wants of the motorist or chauffeur. The space is 70 by 90 feet. A pleasantly situated room on the second floor, plentifully supplied with daily papers, up-to-date automobile and other magazines, is reserved for the use of chauffeurs while waiting.

The general offices are located on this floor, these being completely furnished, systematically arranged and free from confusion. Here, most of the business of the territory covered by the branch can be attended to promptly, thereby relieving the factory of much congestion.

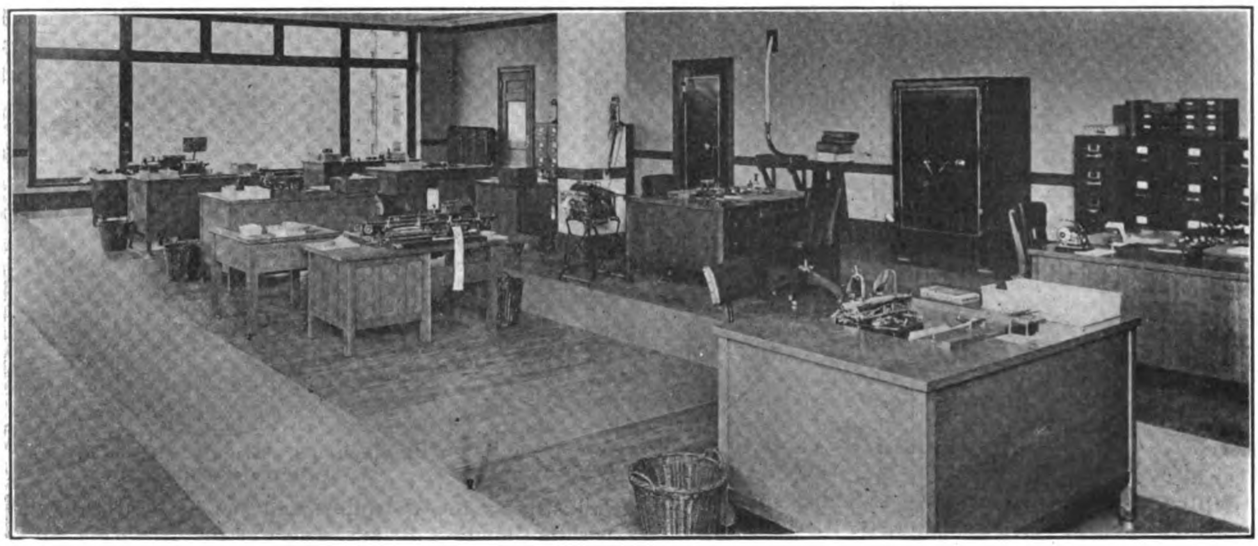
Assuming that a car comes into the building for a complete overhaul: The owner is conveyed to the stock room by a small automatic elevator, which connects the salesroom with each of the six floors. The former is directly behind the general offices, and a large high counter separates it from the public lobby, off which opens the chauffeur's room, the superintendent's private office, and the accessory department. In the latter is displayed extra motor car equipment, including trunks, windshields, speedometers, robes, etc., from which the owner may make selection for the further improvement of his machine.

All business with the owner or chauffeur is conducted over the counter. The statement of repairs desired is made upon a repair card system, after which the car is taken from the garage to the basement by one of the two large electric freight elevators connecting all departments. Here it is stripped of its sundry equipment, which is placed in a locker. Besides these lockers, the basement provides storage for extra bodies and cars awaiting delivery, and contains a boiler room, a smoking room for the use of employees during the noon hour, and a receiving department. In one corner of the boiler room is the Curtis automatic compressed air system, by which a pressure of 80 to 100 pounds is maintained, and the Lamson pneumatic cash service system employed between the office and receiving department.

The car is then conveyed to the overhauling room on the fourth floor. Here every removable part of the mechanism is disassembled, cleaned, readjusted and replaced if necessary, and all features properly reassembled and put in first class condition for a strenuous season's work.

In the rear is the machine shop, completely equipped with machine tools, operated for the most part by individual electric motors for the sake of economy. This section contains: One 18-inch and two 16-inch lathes, one 16-inch shaper, 14-inch drill press, small upright drill press, small speed lathe, two-wheel grinder, large and small arbor presses, many special tools, pneumatic drills and riveting machines, and others necessary for prompt and efficient work.

There is a place for everything and everything must be in its place. The racks are so conveniently located that it is easier to put the tools where they belong than elsewhere. Every workman is required to have a full kit of tools, and should one become lost



Systematically Arranged Business Department of the Peerless Motor Car Company of New England's Service Station at Boston.

or broken, it must be replaced immediately at a reasonable cost from stock. The habit of borrowing is firmly discouraged. Special tools are kept in the machine tool department, and a regular factory checking system is employed to keep track of them. Each workman has a certain number of brass checks, which he may exchange for the tools required.

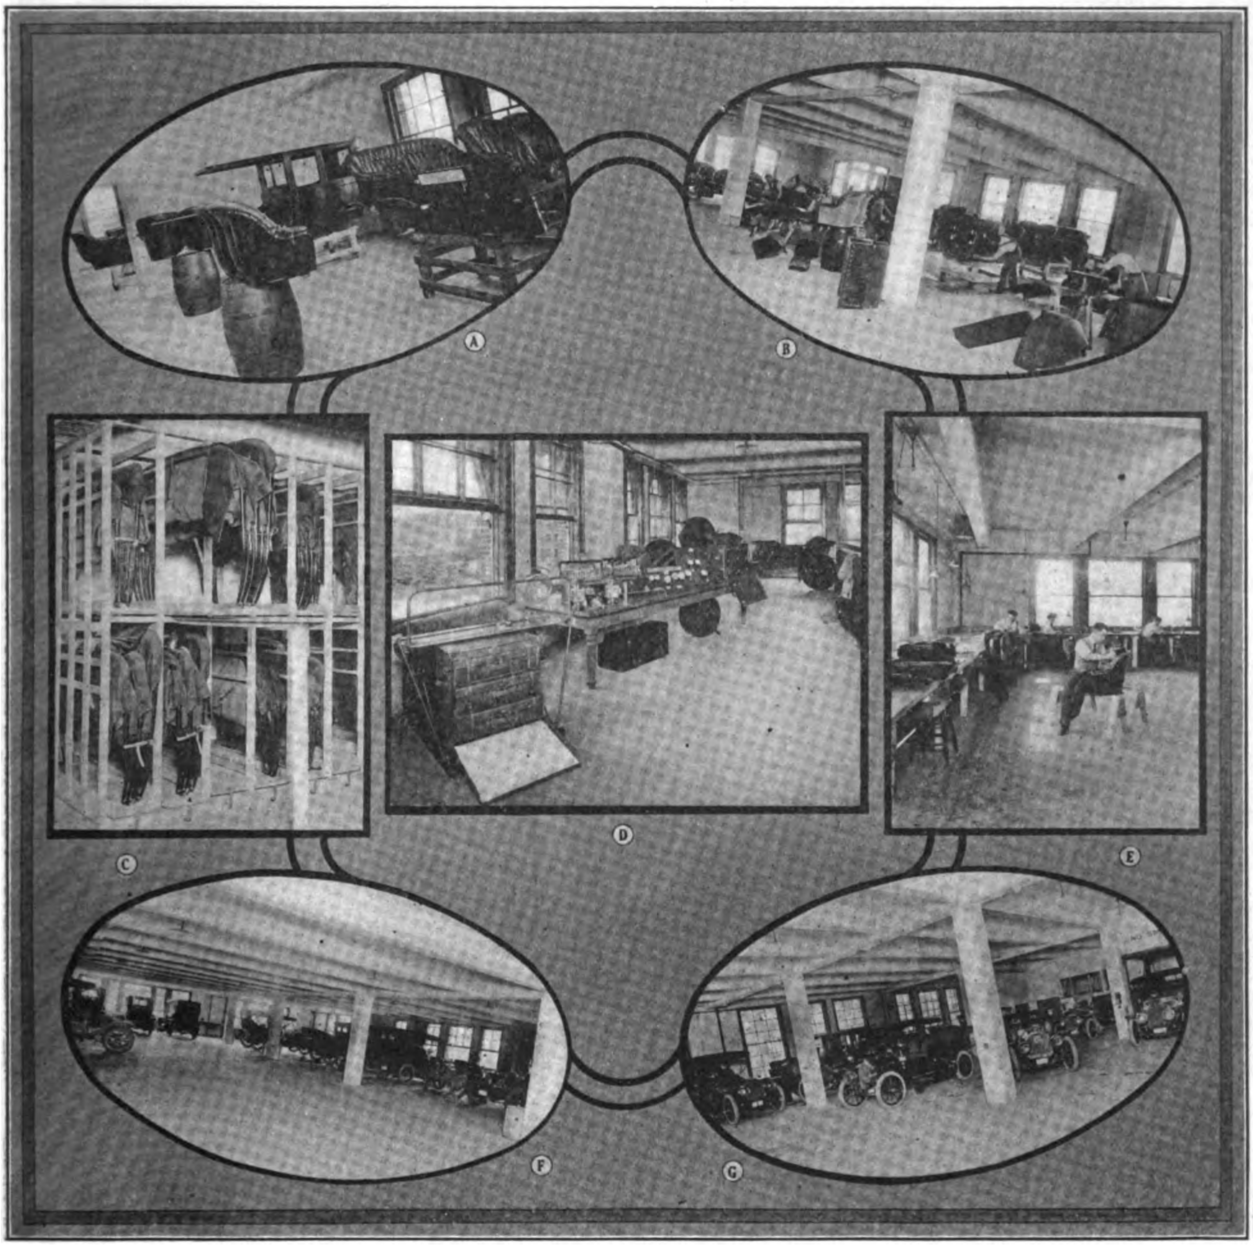
All electric wires throughout the machine shop are enclosed in metal conduits, and switches are of special design, conveniently arranged. Work benches throughout the building are supported on cast iron brackets on which rest three-inch maple planks provided with deep, wide drawers and trays. Each workman has a vise and compressed air is piped to his bench. Another feature is the emergency medicine case, with bandages and antiseptic dressings for use in case of accident.

Three substantial cast iron motor testing stands occupy one corner of the overhauling room. By way of special equipment may be mentioned the portable crane with windlass attachment, by means of which one man can remove a motor from its chassis with ease. It also is found useful in handling gearsets, rear axles, bodies, etc. No ropes are employed in this work, but specially designed iron slings, not only facilitate operations, but prevent damage to less substantial moving parts.

Chassis are supported on cast iron standards while undergoing overhaul. The motors are tested under their own power, and excellent provision is made for water, gasoline and ignition connections, as well as conducting the exhaust gases into the open air over the roof of the building.

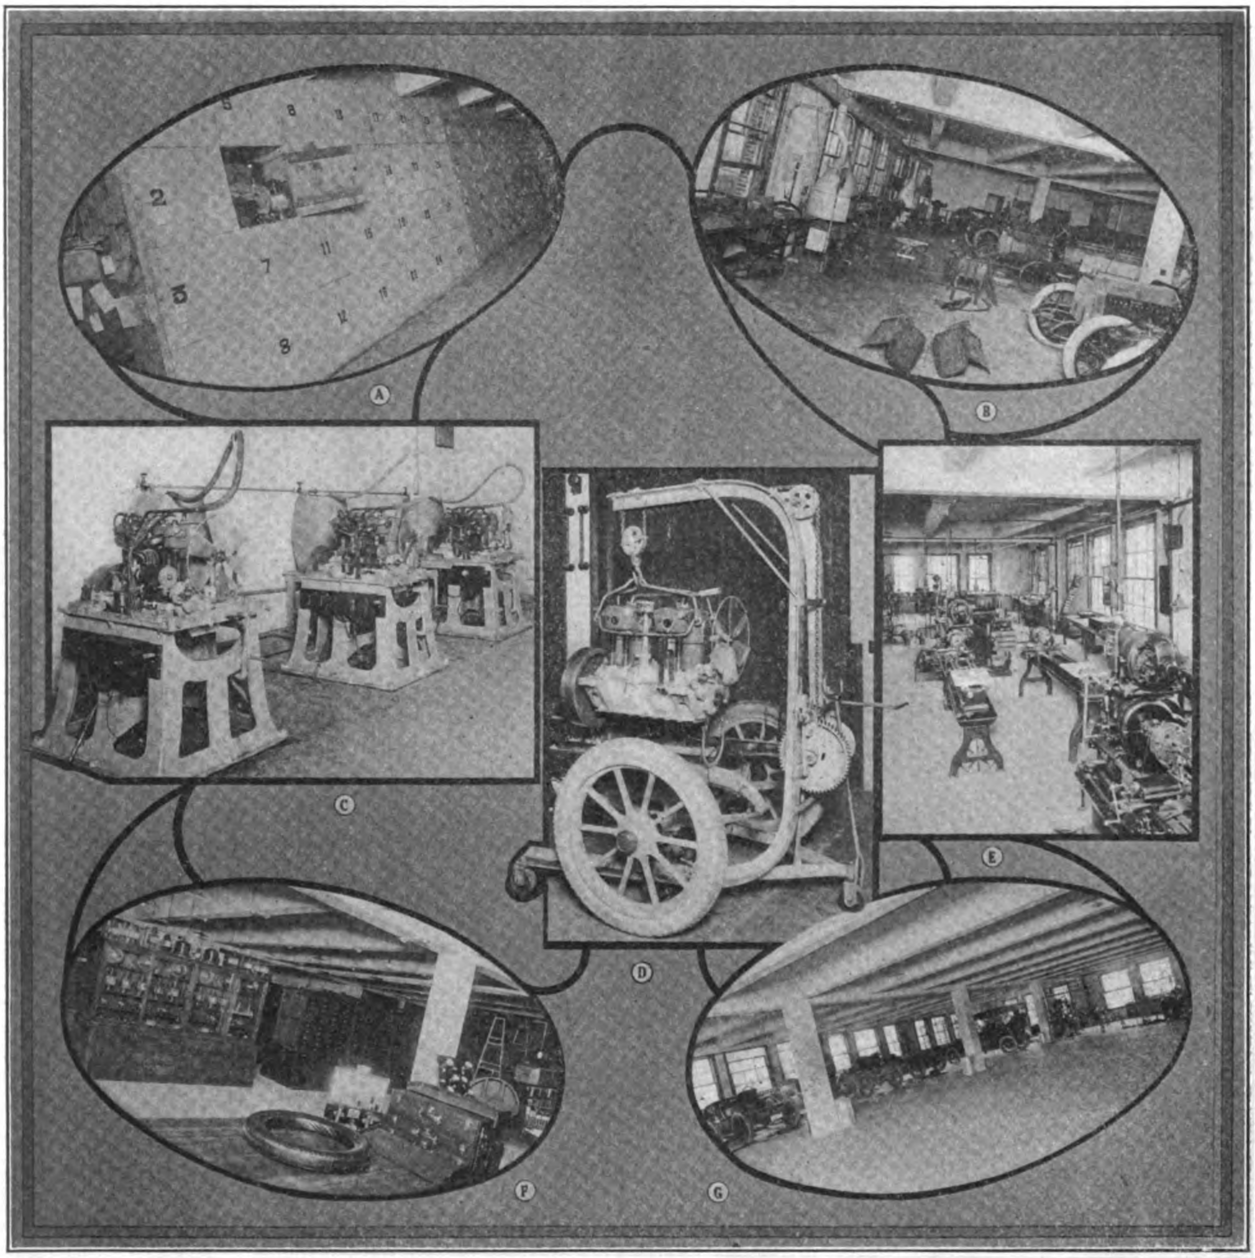
The third floor is devoted to the small repair department, which it has been found convenient to have located separately from the general overhauling work, in order to avoid confusion. This is devoted solely to jobs requiring but a few hours' or days' time. The equipment consists of an emery wheel grinder, speed lathe, drill press and valve grinding machine.

The stock room, a consideration of which naturally comes in connection with repair work, occupies a neatly furnished apartment on the second floor. Practically all of the spare parts are kept in the drawers of a long series of cabinets, these being of various sizes to form suitable receptacles. Most of them are



Important Features of Peerless Plant: A, Bodies Drying in Varnish Room; B, Plenty of Light in Painting Department; C, Specially Devised Rack for Storing Tops; D, Interior of Accessory Salesroom; E, Workmen Engaged in Upholstery and Trimming Shop; F, Where the Small Repair Jobs Are Cared for on the Third Floor; G, Garage or Actual Service Department, Devoted to Immediate Needs of Owner or Chauffeur.

numbered so as to correspond with the list of the parts they contain. The cabinets are arranged according to the model of the car for which the parts are made, the system being such that even a novice can find them readily. A large table is provided, on which incoming goods are placed and checked before being distributed to their respective bins. A very simple and substantial cast iron rack holds the supply of tires, battery and tool boxes, etc., and specially constructed tills and cabinets contain the raw bar and sheet metal materials, tops and seat cloth and fabrics, batteries, and oils and greases in cans.



Distinctive Arrangement of Peerless Departments: A, Lockers Provided for Accessories in the Basement; B, Where the Metal Work for Special Bodies Is Performed in the Blacksmith Shop; C, Substantial Motor Testing Stands; D, Portable Crane Removing Engine from Chassis; E, Complete Equipment of Machine Tools Operated by Individual Electric Motors; F, System as Applied to Stock Parts; G, Orderly Appearance of General Overhauling Room.

The blacksmith and tinsmith shops are on the fifth floor, occupying a portion of the body trimming department. The three forges are operated by individual electric motors. Like all other parts of the organization, these two shops are in charge of workmen skilled in their trades, who are provided with every facility for producing good results. Here, the metal work for special bodies, such as fenders, is formed and fitted.

Two-thirds of this floor is devoted to trimming and upholstering. A special rack is provided for the storage of motor car tops, during the time the bodies are being overhauled, painted, etc. This has two decks, and is extremely simple in operation. The workman who wishes to take a top out of the rack, pulls a handle on the baseboard, whereupon it slides along smooth rails or guides, so that the services of but one man are needed to remove and adjust the fitting to the vehicle in question. A series of steps is designed to be placed alongside the car, so that it is easy to reach any part of the top when raised.

Besides the minor repair work conducted on the third floor, is that of electroplating, a special room being provided for that purpose. This is arranged for replating brass, nickel and copper and for buffing and polishing plated articles. The equipment includes: Four electroplating baths, one each for brass, nickel, copper and black nickel; potash dip, acid dip, rinsing trough, solution cleansing jars, two electrically driven buffing wheels and a work bench.

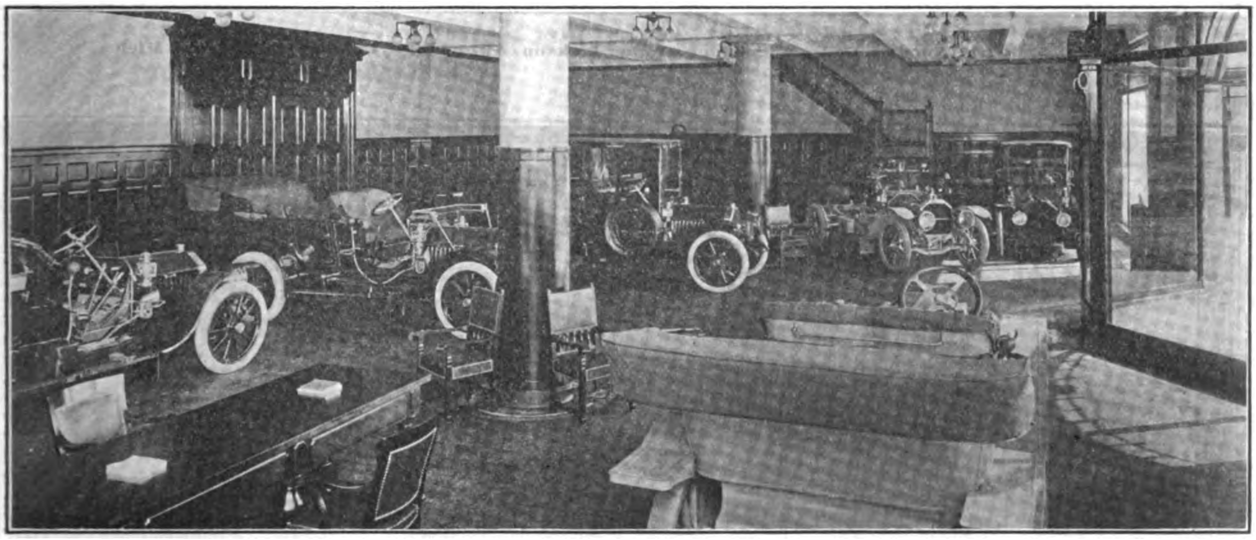
A particularly interesting feature of the building is the painting and varnishing department on the top floor. The lighting facilities are most important, and the Peerless paint shop is well equipped in this respect. The dust proof drying room is at the rear. A specially constructed rack occupies one portion, this being reserved for the storage of glass fronts, mud aprons, and similar parts, after they have been cleaned, painted and varnished, and while they are awaiting reassembly on their respective cars. Steel clothes lockers, sanitary wash basins, lavatories, etc., are provided for the workmen, whose interests are looked after in every way, conducive to convenience, construction and arrangement.

Pleasantly Situated Chauffeurs' Waiting Room in Peerless Building.

The entire building is of steel and cement, the posts being located 30 feet apart, so as to permit of the easy manipulation of cars. Even the floor is marked with heavy white lines, which indicate the places in which the vehicles must be left, so that a sort of military precision is everywhere apparent. Besides those previously mentioned, there is a small electric freight elevator, connecting all floors, and passing through the stock room, this being utilized for transferring heavy parts where needed. In addition, concrete floors provide an easy and rapid means of egress in case of necessity.

There are some 150 employees on the payroll, exclusive of the office force, indicating the extent of the business carried on by this branch. System and simplicity prevail throughout every department, and nothing is allowed to interfere in the slightest with the established policy of doing even small things well. This is best exemplified in the conduct of the garage, where a record of each car that comes in and goes out of the place is maintained rigidly. Bowser oil and gasoline storage and supply outfits handle the fuel and lubricant for the cars employing this service, and a very simple card system is used in connection with a Fisher tag writing machine for such repairs and adjustments as are needed.

Accompanying illustrations bring out the various details in a satisfactory manner. Particularly, do they present the well arranged interior of the building and the importance of the lighting facilities. It only remains to point out the peculiar advantage of having such work performed by men who are skilled in handling Peerless cars, thus being thoroughly familiar with the needs of their owners.



Quiet Refinement Characterises the Salesroom of the Peerless Branch, Covering the Entire New England Territory.

PARCEL CARRIER OF ENGLISH DESIGN.

A device for carrying articles on front of a motorcycle or bicycle has been brought out by an English concern. It consists of a piece of strong wire, rubber covered to protect the nickel of the handle bars, bent in the shape of a ram's horn and attached so as to guard the post and extending over the handle bars on each side. After turning below the bar, the ends are bent upward in a U shape for carrying a parcel.

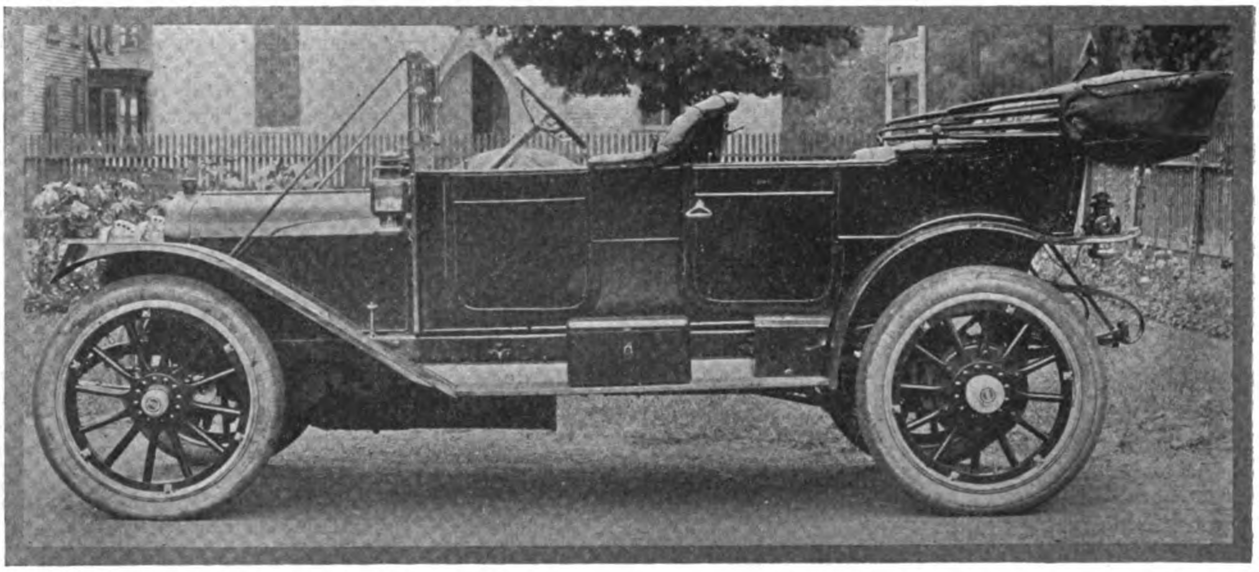
REMOVING OBSTRUCTION IN FEED PIPE.

The stopping of the engine after every few yards of running sometimes indicates a choking in the gasoline feed pipe from the tank to the carburetor. This may be relieved at times by disconnecting the feed pipe and giving it a few blasts of air from a tire pump. If this fails, a piece of fine strong copper wire may be cautiously probed in the piping to remove the obstruction without injuring the tubing.

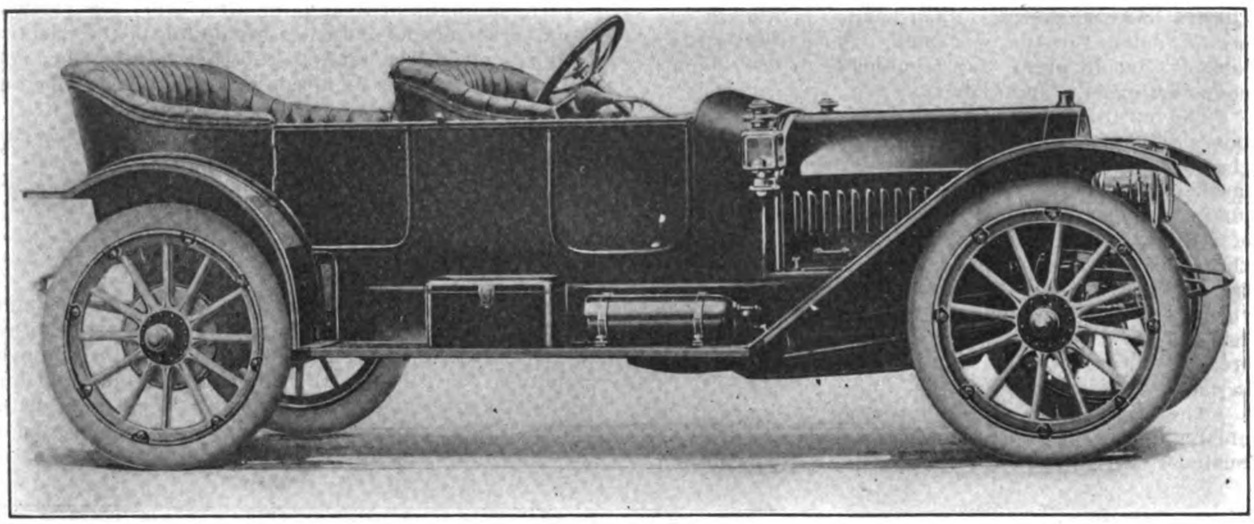
MAKING ENGINE START EASIER.

The best way to start a motorcycle power plant, avoiding unnecessary racing and clattering, whether it has a free engine clutch or not, is to turn it over rapidly a few times with the throttle wide open and the ignition cut off. This will give fresh charges of gas in the cylinders. Then, close the throttle to normal position, switch on the spark and give the engine a short, sharp kick either with the pedals or hand crank, if such is provided. This method will be found easier than pedaling or cranking until one is winded, and will also prevent the engine racing.

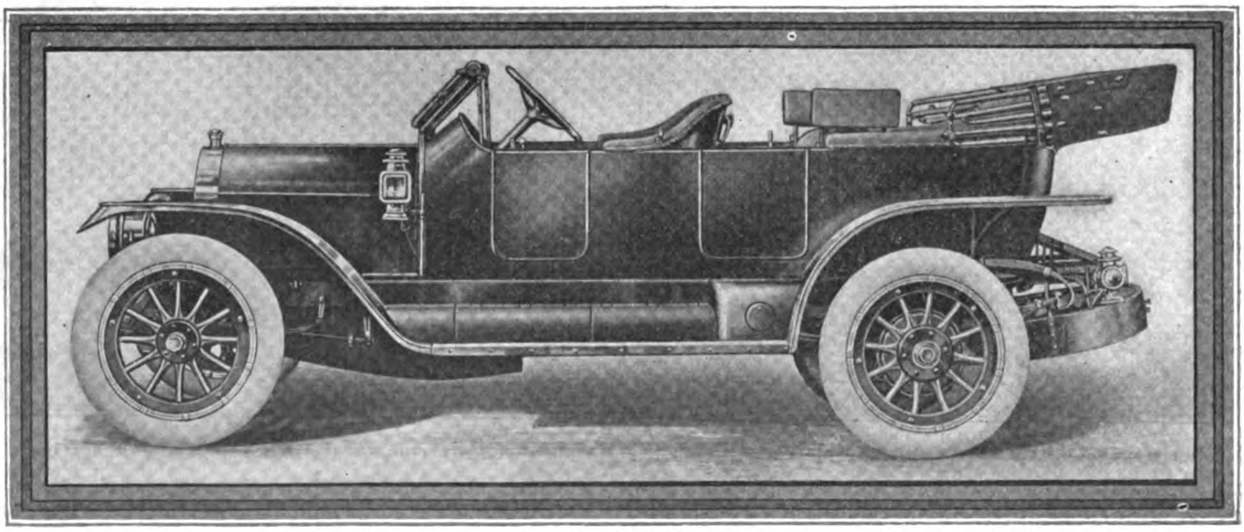
LEADING TYPES OF 1912 CARS.



Model 40, with Touring Body, a Product of the Corbin Motor Vehicle Corporation, New Britain, Conn.



Model 52, with Touring Body, a Product of the Jackson Automobile Company, Jackson, Mich.



Model R-45, with Six-Passenger Body, a Product of the Knox Automobile Company, Springfield, Mass.

TABLE OF SPECIFICATIONS OF THE TWO CORBIN MODELS FOR 1912.

MODEL 30.

Motor—4.5-inch bore, 4.25-inch stroke.
Cooling—Gear pump, honeycomb radiator.
Carburetor—Float and jet.
Gasoline capacity—15 gallons.
Ignition—Double system including magneto.
Lubrication—Eccentric pump supplying splash. Reservoir holds six quarts.
Clutch—Leather faced cone.
Gearset—Selective sliding gear—three forward, one reverse.
Wheelbase—115 inches.
Tread—56 inches.
Wheels—34 by 4 inches fitted with Universal quick detachable rims.
Brakes—Two separate independent sets on rear wheels.
Springs—Special alloy steel. Front, semi-elliptic; rear, three-fourths elliptic.
Axles—Front, I beam section; rear, semi-floating.
Weight with standard equipment—Roadster, 2300 pounds; Touring car, 2500 pounds.

MODEL 40.

Motor—4.75-inch bore, 5.5-inch stroke.
Cooling—Gear pump, honeycomb radiator.
Carburetor—Float and jet.
Gasoline capacity—20 gallons.
Ignition—Double system including magneto.
Lubrication—Over and over self-contained circulating system. Reservoir holds two gallons.
Clutch—Leather faced cone.
Gearset—Selective sliding gear—three forward, one reverse.
Wheelbase—120 inches.
Tread—56 inches.
Wheels—36 by 4 inches fitted with Firestone quick detachable demountable rims.
Brakes—Two separate independent sets on rear wheels.
Springs—Special alloy steel. Front, semi-elliptic; rear, three-fourths elliptic.
Axles—Front, I beam section; rear, full floating.
Weight with standard equipment—Toy tonneau, 3000 pounds; Torpedo, 3000 pounds; Touring car, 3200 pounds; Limousine, 3850 pounds.

DETAILED SPECIFICATIONS OF THE THREE NEW MODELS OF JACKSON CARS FOR 1912.

MODEL 52.

Motor—4.75-inch bore, 4.75-inch stroke, individual cylinders.
Cooling—By water, thermo-syphon system.
Carburetion — Automatic, auxiliary air valve.
Ignition—Double system, low-tension magneto and batteries.
Lubrication—Special Jackson splash and pump.
Clutch—Multiple disc in oil.
Gearset—Selective, sliding gear, three speeds forward.
Wheelbase—124 inches.
Tread—56 inches (60 on special order).
Tires—36 by 4 inches on demountable rims.
Springs—Full elliptic, all around.
Axles—I section front, ball and roller bearing rear.
Frame—Pressed steel, dropped between axles.
Weight—2700 pounds.

MODEL 42.

Motor—4.5-inch bore, 4.5-inch stroke in pairs.
Cooling—By water, thermo-syphon system.
Carburetion — Automatic, auxiliary air valve.
Ignition—Double, low-tension magneto and batteries.
Lubrication—Special Jackson splash and pump.
Clutch—Multiple disc in oil.
Gearset — Selective, sliding gear, three speeds forward.
Wheelbase—118 inches.
Tread—56 inches (60 on special order).
Tires—34 by 4 inches on all four wheels.
Springs—Full elliptic all around.
Axles—I section front, ball and roller bearing rear.
Frame—Pressed steel, dropped between axles.
Weight—2400 pounds.

MODEL 32.

Motor—Four-inch bore, four-inch stroke, in pairs.
Cooling—By water, thermo-syphon system.
Carburetion—Automatic, spray type, auxiliary air valve.
Ignition—Double, low-tension magneto and batteries.
Lubrication—Special self-contained, Jackson splash.
Clutch—Multiple disc in oil.
Gearset — Selective, sliding gear, three speeds forward.
Wheelbase—110 inches.
Tread—56 inches (60 on special order).
Tires—32 by 3.5 inches on all four wheels.
Springs—Full elliptic, all around.
Axles—I section front, ball and roller bearing rear.
Frame—Pressed steel, dropped between axles.
Weight—2200 pounds.

TABLE OF SPECIFICATIONS FOR THREE 1912 MODELS OF KNOX CARS.

MODEL R, FOUR-CYLINDER.

Motor—Five-inch bore, 4.75-inch stroke.
Cooling—Centrifugal pump, honeycomb radiator.
Carburetion—Stromberg automatic, auxiliary air valve.
Gasoline capacity—16 gallons.
Ignition—Double system, Bosch magneto, battery.
Lubrication—De Dion system, oil pump outside crankcase.
Clutch—Three-plate, dry, cork inserts.
Gearset—Selective, sliding gear, three speeds.
Wheelbase—117 inches.
Tread—56 inches.
Tires—36 by 4.5 inches on Fisk demountable rims.
Brakes—Two sets within rear hubs, equalized.
Springs—Semi-elliptic front, three-quarter rear scroll ended, 50 inches long.
Axles—I section front, semi-floating rear.
Frame—Cold pressed alloy steel.
Weights—Two-passenger, 3000 pounds; 4 raceabout, 3100; 5 tonneauette, 3250; 4 and 5 torpedo, 3450; 7 touring, 3500, and 7 limousine, 3700.

MODEL R-45, FOUR-CYLINDER.

Motor—Five-inch bore, 5.5-inch stroke.
Cooling—Centrifugal pump, honeycomb radiator.
Carburetion—Stromberg automatic, auxiliary air valve.
Gasoline capacity—18 gallons.
Ignition—Double system, Bosch magneto, battery.
Lubrication—De Dion system, oil pump outside crankcase.
Clutch—Three-plate, dry, cork inserts.
Gearset—Selective, sliding gear, three speeds.
Wheelbase—126 inches.
Tread—56 inches.
Tires—36 by 4.5 or 37 by 5 inches, Fisk demountable rims.
Brakes—Two sets within rear hubs, equalized.
Springs—Semi-elliptic front, three-quarter scroll ended rears, 54 inches long.
Axles—I section front, full floating rear.
Frame—Cold pressed alloy steel.
Weights—Four-passenger raceabout, 3350; 5 tonneauette, 3500; 6 torpedo, 3700; 7 touring, 3750; 7 limousine, 3950

MODEL S, SIX-CYLINDER.

Motor—Five-inch bore, 4.75-inch stroke.
Cooling—Centrifugal pump, honeycomb radiator.
Carburetion—Stromberg automatic, auxiliary air valve.
Gasoline capacity—16 gallons.
Ignition—Double system, Bosch magneto, battery and Connecticut distributor.
Lubrication—De Dion system, oil pump outside crankcase.
Clutch—Three-plate, dry, cork inserts.
Gearset—Selective, sliding gear, three speeds.
Wheelbase—134 inches.
Tread—56 inches.
Tires—38 by 5.5 inches on Fisk demountable rims.
Brakes—Two sets within rear hubs, equalized.
Springs—Semi-elliptic fronts, three-quarter scroll ended rears, 54 inches long.
Axles—I section front, full floating rear.
Frame—Cold pressed alloy steel.
Weights—Four-passenger raceabout, 3700 pounds; 5 tonneauette, 3900; 6 torpedo, 3950; 7 touring, 4000; 7 limousine, 4200.

Schools and Agents Write

BUSINESS PROSPECTS EXTREMELY PROMISING.

The nation is so large, the commercial interests are so varied and the business conditions so diversified that it is not possible nor practical to determine an average and apply this to every situation it is desired to analyze. While it is not probable that the fullest extent of activity will be realized until the different factors that make for unrest have been disposed of, or at least minimized, it is safe to assume that there is little to fear so far as prospects are concerned. In fact there ought to be a steady and consistent betterment of trade volume, and with this will come a certain degree of confidence that will be generally promotive.

Locality summaries are not always dependable, for the aggregate of business may be, and no doubt is, a very small part of the entire transactions of the nation. It would be manifestly impossible to gain even a fair average by dealing with generalities. For this reason any statement from any given section cannot be accepted as a basis on which to gauge business as a whole, and local conditions may only be represented by the expression of one or a few rather than of the entire number.

There is no question, however, that the automobile industry can look forward confidently to a season of improvement. There are numerous reasons for this. The anticipatory buying of agents may be first of all regarded as conservative, and the forecasts are generally well within the limits of possibilities. While this may be applied to pleasure cars as a whole it is a fact there is an entirely different aspect so far as the industrial wagons are concerned.

The pleasure vehicle is to be regarded more as the convenience or the luxury, but with the commercial transport business considerations largely, if not wholly, control buying. The volume of business transacted by the builders and the distributors of power wagons during the past season exceeds very largely any past experience. The utility of this type of vehicle has been so capably demonstrated during the year now closing that the agents and the manufacturers find themselves generally with orders ahead that will require considerable time to fill.

The demand for wagons and trucks is surprisingly large at this season of the year, based on experience and expectations, and there is no reason to believe that when the spring deliveries are begun there will be a recurrence of conditions such as were developed for several years with pleasure cars. In other words, the orders will be decidedly larger than the available stock and delays will be unavoidable. Just to what extent this will be realized and what results will follow are problematical subjects, but it is unquestioned that if this situation is anticipated and understood it can be better coped with.

The autumn has always been the period of the least activity of the year, and while this has been the experience during the last two months there has been an improvement as compared with previous seasons. The belief prevailed a year since that cars would be very cheap and that used machines could be bought at a very large discount from cost, and the prevalence of this opinion was the occasion of a general stagnation of business. This supposition had its effect in several ways, first of all deterring many from buying until the cars then owned had been disposed of, selling being conditional upon the realization of a certain price, causing many to "shop" cars with sale dependent upon offers close to the prices established; lessening the prices of used cars in the hands of the dealers, and generally causing a condition of stagnation that could not be stimulated until well into the spring.

All this has been changed. There is a better understanding of conditions and a knowledge that automobiles have a commercial value when contrasted with other industrial products because of a constant and increasing demand. The markets of the nation are upon a more substantial basis. There is a feeling of greater business security and confidence. The ramifications of the motor vehicle industries are such that hardly another industry can be named that has not some relation and reflects to a greater or less measure the activities. In this light and considered soberly it will be seen that the automobile industry does not differ with any other. It is not alone as regards influence of business conditions. In fact, it is not more affected than is any other by business development or depression.

From practically every section of the country there is report that seems to justify the belief that the autumn and winter business will be larger, and the transactions will be materially increased when the number of industrial vehicles required is included. There is one factor that cannot be lost sight of, and that is that eventually the major part of the manufacturing and the distributing will be of wagons and trucks, and the minor part will be the making and selling of pleasure machines. The ratio of the one will increase and the other will correspondingly decrease until a level is found. This may be realized later or earlier than may now be estimated, but the exact time of realization is not material.

In the communities where machines are produced, noticeably in cities like Detroit, Cleveland, Indianapolis, Buffalo and others where large plants are located, the factory production no doubt has immediate effect on local enterprises, but this is not necessarily a certain indication.

But in the cities where motor vehicles are built in large numbers from the factories is reflected an expression of satisfaction and confidence as to the business in prospect. With hardly an exception there is activity and faith in increase of orders. The manufacturers have sought to equalize the demands upon their facilities during the entire year and those who have equipment for the production of power wagons believe that it will be possible to so apportion each class as to afford a supply almost if not quite equal to demand.

The progressive distributors have in a like manner endeavored to stimulate business by bringing to the attention of the people as a whole the most recent productions. This was attempted for several years at the opening of the season in New York, but this same idea has been applied in Chicago and other western cities with exceedingly good results.

As to the autumn business as experienced in different sections of the country it may be said that there has been improvement as compared with other years. Throughout the eastern commercial centres, especially in larger cities, the disposition is to give orders early for spring delivery and to drive this season's machine through the winter weather. There is never, save in rare instances, willingness to utilize a new machine for winter service unless it be a closed car, but there has been in many communities of proportions a tendency to use the automobile throughout the year. With the dealers whose businesses warrant, a profitable policy has been to adapt body equipment to service conditions, and exploitation of closed types for cold and stormy weather has been productive to a surprising degree.

The use of the automobile for every purpose is increasing rapidly in the South. The roads are by no means what they are in the North and East, but touring has been remarkably promotive and there is undeniably an enthusiasm for good highways that will be especially stimulative of the use of the motor vehicles. The same is true of other sections of the country, especially the Northwest. All sections of the

Middle West are utilizing the power conveyance more generally than ever before, and the Pacific Coast market, never small, has been materially increased.

The possibilities for export have never been seriously exploited by the makers of motor vehicles of America, although some of the manufacturers have undertaken to compete with the industries of Europe, but it is a fact that the development of the industrial wagon has presented the opportunities in new light. There appears to be little doubt that, as the United States has always been one of the leaders in building of agricultural machinery and vehicles, it is entirely reasonable and logical for the larger concerns to enter into the foreign markets with the same energy and methods that have been successful, with such adaptations as may be necessary in meeting the changed conditions.

The requirements for foreign service differ considerably as compared with domestic needs, but this is understood and careful study of essentials ought to bring about productions that will not only be satisfactory in cost, expense of upkeep and maintenance, but in hard and continuous use. Of course in the building of these classes of machines the industrial or manufacturing result would be locally and nationally manifested.

EXCLUSIVE REPAIR SHOP SYSTEM A SUCCESS.

The repair shop exclusively for motor vehicle service, in which work of any kind may be undertaken and performed to a standard of workmanship, is the exception today. There may be general supposition that such an enterprise would not have the patronage that would be justified; that the charges for the work would be excessive, and that there might be prejudice from the assumption that being separate from any car agency "accommodation" would not be accorded. As a matter of fact there is nothing more of a drain upon a business nor anything so inimical to good service as unsatisfactory attention and absence of the protection that is assumed should be provided.

Form No. 1—Repair Tag.

Repair shops are not all well equipped and systematized. Perhaps the majority can be improved in both respects. Naturally the purpose is to make the least investment commensurate with the service established, yet to give the best that is possible with the equipment. There must naturally be a possibility of expansion and the future must be considered to some extent. Satisfactory shelter must be had for all the cars on which work is progressing, and there ought to be reasonable storage space. These, however, are details which are separate from the shop organization, with which it is proposed to deal.

There is no reason for any person other than the workman, working on a car once it has been placed in the hands of the repairer, and this when required by rule establishes a shop responsibility for tools and supplies; that is, control of every possibility for leak is entirely in charge of the management.

A system that has much to commend it is that adopted at the formation of the Universal Auto Repair Company, Hartford, Conn., which concern leased the repair shop connected with the Miner Garage after it had been given over by Mr. Miner as being unprofitable. The members of the company were three practical mechanics, who had been connected with the Pope Manufacturing Company, and thoroughly experienced with all classes of motor vehicle work. The firm was created with the view of having each partner supervise a part of the work, working with and directing the men, one of them giving whatever time was necessary to the office detail.

The firm established a policy that included charging good prices for the work, guaranteeing satisfaction to the customers, treating the men with a view of developing the business, and economizing wherever possible. It was further decided that advertising would be the only expense that could not be minimized. In connection with the policy it was decided that no work should be undertaken by the job, unless it was understood that the estimate was an outside figure and if the work did not reach this in the aggregate the customer was to receive the benefit. In other words if an estimate were made this was not the charge if the total value of the service was less, but under no circumstances was a sacrifice made. This was found to work out satisfactorily in practise and the patrons found they were paying for what they received, and no more.

Form No. 2—Time Card.

The company did not deal in accessories. It made a point to obtain whatever was desired and gave the benefit of experience in selection of what was the most desirable equipment. The location in the garage building was found to be beneficial in that a transient business was attracted, but the chief purpose was to give a thorough and high class service to garages that did not do repairing. That the firm was composed of reliable men was an important factor in developing business and this organization had no difficulty in inspiring confidence.

Form No. 3—Stock Room Order.

Shop organization was the principal task when business was begun. To create a system that would minimize the office work and yet insure accuracy and results was imperative, and this developed what may be applied to every shop, whatever its proportions. This system has the merit of extreme simplicity and efficiency. Incidentally it should be said that good machine tools were indispensable, this reducing resort to specialists, and each workman was supposed to furnish his own kit of hand tools. The shop tool room was well stocked and for this the checking plan was adopted. The stock room was supplied with carefully selected materials to meet all ordinary requirements.

That the system may be made perfectly clear to the reader it is proposed to follow a job through the shop and to note the record made. The books kept by the office are a cash book, journal and ledger, which are supplemented by the original records, which are preserved and are instantly available for reference.

ALL INVOICES MUST BEAR OUR ORDER NUMBER, Seymour
OTHERWISE THEY CANNOT BE CHECKED FOR PAYMENT.

Form No. 4—Stock Order.

Each job received is given an order number, which will be apparent by reference to the repair tag and instruction, which is a heavy manila card 6.25 by 3.25 inches. This tag is filled out and it contains data as to name, address, make of car, and the date received, which is transcribed from the tag to the bill. The tag is the memoranda and the bill, made in duplicate upon a blank sheet, shows all but the printed matter on the bill. The tag is then consulted by the head of the work room and on the reverse is written the instruction which outlines certain work and with whatever incidentally may be regarded as necessary.

The work is begun on the car and during the first day three men work 14 1-2 hours, and they use two gallons of machine oil and a gallon of gasoline for washing the parts. The oil and gasoline are delivered from the stock room for which receipt is given by Seymour. The stock order is given the same number as the order, and this order identity is preserved through the shop. The stock orders and the time cards for each day are taken to the office at the end of the day and the following morning are examined and checked and filed. The time card, which is indicated by a single form, shows that James Grady, for instance, worked nine hours during the day, five of which was the job for which the order number is 92, which is identified by the name of the car owner on the ticket, for additional accuracy. The form of blank is self-explanatory. The stock room order is also taken and it is found that on the same day the gasoline and oil were delivered. By further reference to the bill form appended it will be noted that from the time cards and stock room orders each bill is filled out daily and brought to the minute. When the charge is made on the bill the duplicate is also made and this gives a complete record. The time card is shown as Form No. 2.

To Customer

Form No. 5—Completed Bill.

The stock room order and receipt is a voucher for the charge as well as being a record for the delivery of stock. It is shown as Form No. 3.

The following day, the second the car is in the shop, two men work upon it 13 hours, time cards accounting for this. But to reface the brake bands lining is necessary, which is not carried in stock. This calls for an order, which is made on a local dealer in this case, specifying what is necessary, bearing the job order number. The original is sent Brown, Thompson & Co., and aside from the firm heading and the note at the foot of the blank is identical with the duplicate. The order is retained by Brown, Thompson & Co., and the duplicate is sent to the office. This is shown as Form No. 4.

Another order is made upon the stock room for 32 copper rivets. The third morning the charges for time and for stock ordered and from the stock room are entered upon the bill as before. This day two men work eight hours upon the car and this is similarly charged. The car was in the shop the morning of the fourth day, but is called for by the owner. When he asks for his bill it is ready and waiting for him, complete. In the event of a charge being questioned the time cards and the stock room orders are instantly available, and the record of the order given outside. The bill can be re-checked from the record if desired. From the stock orders is shown the shrinkage in the stock while the outside orders indicate the amounts due by the firm for any reason whatever.

The bill as completed is itemized and the original is sent while the duplicate is retained, this being in loose leaf binding and indicates each bill remaining unpaid. As each nut, cotter or any other supply is charged and accounted for it is understood the books required are few indeed. The records are preserved on file by month and may be consulted instantly. The form of bill is indicated and it will be seen that with all transient business as cash and comparatively few accounts it is possible to keep very close oversight of every bill by reference to one file. The completed bill is shown as Form No. 5.

It may be noted that each bill contains a record of every order upon stock or outside and the price charged.

Should there be a car sent into the shop for overhaul and where there is more or less work to be performed, the order is given number and the date, make of car, car registry number, name of owner and address, and then instructions are written in detail the order being 10 by 5 inches and made in duplicate on a heavy manila card. The original is retained in the office and the card is attached to the car, and then the process is as has been outlined. This blank is used only for winter overhauling and general long repairs and is filled out in detail.

As has been stated this system is admirably simple, it gives the results, it requires but little time, it safeguards the company and the customer, includes every desired fact, and indicates precisely a transaction with regard for every requirement of business. It has given satisfaction with a few or a considerable number of men.

YOUR EXPERIENCE WITH YOUR BUSINESS.

Profit or Loss Dependent Upon Organization and System Judiciously Applied--What Will Yield Economy and Perfect Garage Service.

With many the establishment of the garage is the outcome of demands made upon the agent for the repair and maintenance of the cars he has sold. It is a logical conclusion that the distributor is in a position to supply parts needed for restoration and repair, and this demand by customers forces the stocking of whatever may meet ordinary requirements. Adjustments and attention similarly impel a repair service, and the accommodation of car owners who have no private garage brings about the public station.

There are instances where the garage and the repair shop are a separate enterprise, each entirely apart from the other, neither of which is agent nor broker of cars, and again some agencies have neither garage nor repair facilities. There are those who believe that the most profitable business would be the three divisions in combination. Others assume that the greatest success might be with two instead of three, and still another class believes that the divisions ought to be separate businesses.

It is obvious that to a certain volume of business, however, the repair shop can combine garage service, and, perhaps, the sale of certain staple supplies, because collectively the transactions are profitable, and without all it would not be possible to continue. The need of sheltering the cars when under repair compels at least a fair degree of protection and floor space, which naturally leads to accommodation and eventually constant service.

The combining of the business seems logical, and yet there is a point where it would appear best from the viewpoint of many to divide or separate the departments. Of course much depends upon the local conditions. It may be assumed that systematizing ought to be adopted and consolidation perfected. But as the business may fluctuate widely with the seasons this may not be advisable. Just where the separation should take place, if determined, must also be largely dependent upon circumstances of which the agent must be the judge.

In small or suburban communities there may be the more reason for the combination garage, and in the cities and populous localities the division could be more readily effected. This is another condition that must be carefully weighed in any conclusion reached. For the purpose of obtaining the opinions of those who may have had experience and whose views have substantial foundation the editor of the ACCESSORY and GARAGE JOURNAL invites contributions from readers, these to be not more than 600 words in length, and which review the proposition as described. For the most meritorious of these a price of $5 will be paid, and $3 and $2 respectively for the second and third in point of excellence. The opinions should be submitted within 30 days and should be addressed to "Garage Department," the ACCESSORY and GARAGE JOURNAL. The names of the authors of the articles chosen will be announced in the January issue.

WHAT CLASSES OF CARS SHOULD A DEALER SELL?

One of the greatest problems for agents for pleasure and industrial cars is the choice of vehicle. There are varying opinions as to the character and price of the machine which can be sold to the best advantage commercially. The prices and types are varied broadly. Many men sell one car only, some two, others a greater number; some believe it best to direct attention to one line of endeavor alone; others affirm that two machines of different prices will at least double the market of the locality, and that this policy is well established.

The agent naturally seeks to sell the greatest number of cars he can. There is a limitation to his own and his salemen's endeavors and to the attraction of the single car to the motoring element of the community. If he has one line of cars at what might be a moderate selling price the supposition is that he has the greatest field. If the price of the line be more or less the prevailing belief is that the market contracts or expands with the initial values. There are, of course, makes of cars which include a number of models ranging from low to medium, but these are the exception and not the rule.

Often an agent for a car well established in the community reaches a conclusion that he might broaden his market should he take on another make, this to sell at a price to meet either an extreme or another distinct class. It is the wisdom of choosing another car, and what car will give the best results with the first car sold, that is discussed with much care and thought. While it is true that much depends upon the prosperity of the community or section there are well defined business principles that are applied. This subject may be divided into several topics: Is one car or several cars (makes) the better proposition? If more than one what should be the variance as to price? If three or more how may they be best graduated as to price? Is one or more sales organizations the better policy? Does adding another line of cars lessen the combined expense of selling? Does the division of endeavor lessen the attention to the original line?

To these suggestions ought to be added consideration of the greater attraction and its selling value, for advertising is essential. The readers of the ACCESSORY and GARAGE JOURNAL are invited to express their opinions in articles of not more than 600 words, stating what reasons justify the sale of but one or two or more cars, what classes of cars (market value) appear to be the best for a combination agency, what car by market value would be best combined with an extremely low or a high priced car, and under what circumstances could two cars of approximately the same price be sold.

For the article which has the greatest merit a price of $5 will be paid, and for the second and third best $3 and $2 respectively will be paid. The articles must be submitted within 30 days and should be addressed to "Agency," the ACCESSORY and GARAGE JOURNAL. The names of the authors of the articles decided as best meeting the requirements will be published in the January issue.

WHAT IS THE PROFIT OR LOSS ON EACH CAR SOLD?

Nothing is more vital with any business enterprise than knowledge of profit and loss. Methods which will establish the dividing line between success or failure are regarded as sufficient by many. The supposition is that such information will make possible whatever modification is necessary to insure a reasonable revenue. But this is all generalities and there is nothing specific and definite. Some men are of the opinion that it is best to departmentize a business and to keep the accounts of each department separate, with, of course, general accounting covering an entire business. Such a system applies well enough to some forms of business, such as repairing, garage service, and the sale of accessories, but with the sale of cars there is lack of definite knowledge unless there be careful record of every detail from the time of making the deposit for the car until after the period for any guarantee has elapsed.

Some cars are ordered, shipped, received and delivered without the expenditure of a cent more than minimum cost. With others the delivery period is one succession of expense. The matter of expense is assumedly to be borne by the manufacturer, the agent and the purchaser, and there is a disposition to economize responsibility. All of this is decidedly unsatisfactory in that no precise condition is established for the government of any or all.

It has been found by some of those who have carefully analyzed their business that this variance of expense materially lessens the profits on some of the cars sold, naturally affecting the revenue in this respect. It is not possible to regain such loss, and as an insurance against the possibility of such event it is believed wise to consider each separate car as an entirely different proposition. That is, that an account should be opened with each particular machine and that this should not be closed until the agent is satisfied there will be no further demand made upon him.

There is special value to a detail accounting with each car in that this will establish the value of each repair or service in connection with its sale, and record of this character will make it a comparatively easy matter to find the aggregate cost of selling and, naturally, the exact profit. Where no system of record exists there is nothing that can be regarded as definite.

There are some instances where the cost of selling a single car has been several times the entire commission on the car, and this must be taken out of the general receipts of the business, it not being possible in any other manner to make up the loss. There are innumerable reasons for shrinkage in commissions and the only manner possible for eliminating such causes and consequently economizing the cost of selling is to know exactly the expense attached to the sale of each machine, whether this may be a cash or an exchange proposition.

This subject may be discussed broadly or with a view entirely toward means of systematizing the sales methods and the service to be given to a customer. It is of such importance that the editor of the ACCESSORY and GARAGE JOURNAL invites the readers to submit articles dealing with it and looking toward practical solutions. These articles should not exceed 600 words and should be submitted within 30 days to "Sales of Cars," the ACCESSORY and GARAGE JOURNAL. For the three most meritorious, $5, $3 and $2 will be paid in the order of merit. Any forms necessary should be roughly sketched so that the ideas may be represented in connection with the articles. The names of the authors of the articles given the preference will be published in the January number.

WHAT SYSTEM WILL BEST SERVE GARAGE PURPOSES?

Record is one of the most valuable assets. To have value record must be complete and systematized. Incomplete it is practically worthless. To be thorough does not mean a record or system should be cumbersome or complicated. Simplicity and full results are possible and practical. One of the greatest causes for unprofitableness in the average garage is the loss of property or time through theft, neglect, or incompetency and mismanagement.

Disregard for the property of others is an inherent disease and this can only be offset by a record that will establish responsibility without question. Any form of record means more or less clerical work and an accumulation that may seldom, if ever, be referred to. To minimize the labor of making and in reference it is necessary that there be a reduction of every note or entry to bare facts.

In garages where the number of employees is small there is even less regard given to system. There is an absence of responsibility that is reflected in the service and such condition may drive away patronage and prevents development, a serious result, to say nothing of the immediate loss.

There are any number of reasons for failure of the garage owner or manager to make a profit and innumerable explanations may be made, but while it may be that the business cannot be entirely successful under prevailing conditions it is absolutely certain that loss cannot be prevented unless causes are known. Only through careful inquiry and record is it possible to ascertain where savings may be made.

It may not be wise to make application of record to every detail of the business, but to apply system or record where suspicion has been aroused or attention has been directed cannot be injudicious. This might be adopted with reference to some particular case or condition with a view of establishing fact. On general principle, however, it is certain enough that it would be best to know every detail of the business.

Cost of installation and labor of maintenance are the two factors to be considered. The expense is to be offset by the general saving to be made. The simplest is the better, all else being equal. But conditions differ so greatly that it is difficult to devise what might be applied to all specifically. It is entirely practical, however, to create what can be modified or adapted to meet with the needs of the average garage of moderate proportions.

With a view of obtaining suggestions that may be useful to the readers of the ACCESSORY and GARAGE JOURNAL the editor invites the preparation of brief articles dealing with this subject. For the most meritorious of these a price of $5 will be paid, and for the second and third meritorious $3 and $2, respectively, will be paid. These articles should not exceed 600 words and, if essential, may be accompanied by rough pencil outlines of the forms or blanks that are necessary for the record.

All contributions of this character should be submitted within 30 days, and should be addressed to "System," the ACCESSORY and GARAGE JOURNAL. The names of the authors of the articles selected for merit will be published in the issue for January.

STANDARD WOVEN FABRIC COMPANY.

When the Standard Woven Fabric Company, Worcester, Mass., succeeded to the business of the Multiple Woven Hose & Rubber Company last March the company was organized with capital of $400,000 under Massachusetts law, and acquired the equipment, patents, etc., of the old concern. The officers chosen were: George D. Moore, president and works manager; W. B. McSkimmon, vice president; A. H. Burdick, treasurer and general manager; T. H. Daley, secretary and clerk; J. H. Drury, A. T. Baldwin, both of Boston, and the officers, directors. Mr. Moore was secretary of the original company.

The company owns valuable patents covering its products, chief among which are solid multiple woven cotton belting, specially treated; solid multiple woven hose fabrics and Multibestos brake lining and friction materials. The Multibestos products were placed in the market about six months since and are woven by special machinery from brass wire and asbestos yarn. The chemical treatment was originated by Dr. Moore, who is technical expert for the company, and produces a singularly superior quality of materials.

The company has plans making for the production of new products and for the erection of a factory that will double its manufacturing capacity, in keeping with a policy to broaden its activities and facilities. With the experience of the executives and the character of the products it is anticipated that the company will be a decided factor in this industry.

INCANDESCENCE CAUSES ENGINE TROUBLE.

Faulty spark plug construction, as indicated by pre-ignition, is sometimes a very baffling cause of engine trouble on account of the deceptive symptoms accompanying it, such as slowing down of the motor and indications of serious loss of compression. The trouble is due to the fact that there may be a fine wire extending beyond the central metal core of the spark plug, and owing to the fact that it is well concealed within the shell, the diagnosis of the ailment is particularly difficult. When this projecting piece, which serves no useful purpose, becomes incandescent, it ignites the gas before the spark occurs and causes pre-ignition in a like manner to red hot particles of carbon or any minute metal projections in the combustion chamber. The remedy is to take the plug apart and cut off the electrode flush with the edges of the central core, being careful not to leave any ragged edges when the job is completed, and then bending the remaining wire so it will have the proper air gap between its end and that of the insulated core.

NEW MEXICAN RUBBER PLANTS.

Vice Consul Richard M. Stadden of Manzanillo, Mexico, reports that an American resident of that district has been experimenting in rubber-producing plants for some years, with the result that he has discovered a tree, a vine and three plants which yield first class crude rubber. These plants are said not to have been botanically classified as yet and are known only by their Indian names. Analyses have been made of each in the United States, and it is claimed that each resulted successfully. Mr. Stadden says:

"The tree is of quick growth and can be propagated from slips put in the ground. Limbs that were thrown in the shade and left for six months germinated, and on being planted took root and are now growing well. Trees planted from slips will be large enough to prune in three years; limbs cut from the trees furnish the rubber; pruning can be done every year. This tree produces about six per cent. crude rubber.

"The three plants referred to grow wild and can be reproduced from the seed. In three years they become well rooted. The plant, being then from four to six feet in height, may be cut to the root each year, using the cuttings for extraction of the rubber, leaving the root to recover itself and produce the same each year. The mode of cultivating these plants is about the same as for corn; they will produce eight per cent. crude rubber.

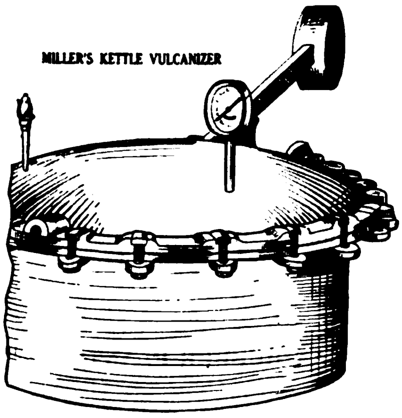
"The vine gives a free crude rubber with no gum. It grows in the shade, extending over the surrounding trees, and is the richest in rubber, giving 10 per cent. of the crude commercial product. Experiments in the cultivation of this vine are now being carried on.

"The discoverer is conducting experiments in different processes of the extraction and coagulation of the milk from these plants and vine and tree, and states that he will be able to produce crude commercial rubber for about 15 cents gold per pound."

BELT SLIPPING OBVIATED.

A remedy advocated to obviate in a great measure the troublesome tendency of a flat belt to slip in wet weather is that of wrapping the pulley with tape, taking care to wind it in the opposite direction from which the pulley runs, so it will not unwind when the engine is in motion. Owing to its large surface area it is not necessary to wrap the rear pulley. The tape, of course, will wear in time and will need to be renewed, but while it lasts the belt will hold as well in wet weather as in dry.

ACCESSORIES AND APPLIANCES THAT SELL.

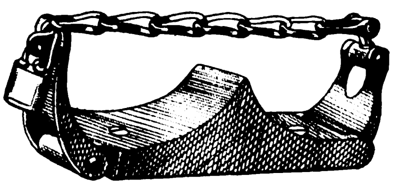


MILLER'S KETTLE VULCANIZER

Miller's New Steam Vulcanizing Kettle is shown in the accompanying illustration and is intended to hold entire shoes. In any kind of vulcanizing work on casings, there will come a time when one has to be retreaded or needs a large patch which extends beyond the reach of the smaller sectional forms. Then, the kettle type is desired. That depicted in the sketch is made in two sizes by Charles E. Miller, Anderson, Ind. The smaller weighs but 2000 pounds and holds from five to eight tires at a time, up to a total height of 38 inches. Of course smaller shoes could be placed within large ones and thus increase the capacity, but for more work, the larger form, which weighs 2500 pounds and holds from seven to 10 tires, is recommended. This has a total height of 44 inches, 16 per cent. greater than the first named. Every large shop handling tire repairs should have sufficient work of a big nature to call for one of these two sizes. They operate entirely by steam, the cover being fitted with a gauge and safety blow-off.

* * *

B-A Tire Locks are made by the B-A Auto Specialty Company, New York City, in answer to the demand for a simple but positive preventative for the theft of spare tires when carried on the car. Ordinarily, these are held by a couple of small straps, and it is only necessary to slash a knife across these, the work of a single second, to make them removable. A large number of extra shoes have been surreptitiously taken from automobiles in this manner, so many in fact, as to bring about the detachment of a special squad of plain clothes men in the metropolis to look after this alone. The device mentioned and shown in the sketch herewith not only holds the tires normally in which it replaces irons and straps, but also prevents their loss. The locking device consists of a stout case hardened chain which is fixed at one end and passed through a hasp at the other. A Yale lock then makes everything secure, and the owner safe in his possession of the key. The company guarantees this specialty for five years. It is made in a number of different forms and sizes.



B-A TIRE LOCK

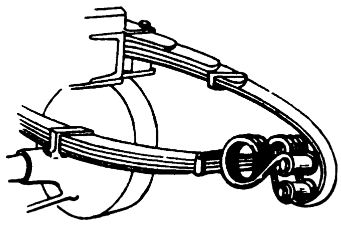
Acme Torsion Springs are of an auxiliary, shock absorbing nature, a pair of them customarily being added to the rear springs of the car. When used there or on the fronts, the back is chosen invariably. They consist of a series of three full circular coils, the ends of which turn up on one side and down on the other. Using a pair of these together, the two upper portions are held beneath the bolts on the side spring, while the two lowers are caught by the spring horn, or frame bolt, or in the case of a three-quarter elliptic member, between the ends of the bolt at the lower extremity of the upper portion or third quarter. In effect this combination eliminates all road shocks, so that the passenger rides without bounce or jounce. The smaller members take up the slighter shocks, and the usual side springs the larger ones. They are made by the Acme Torsion Spring Company, Boston, Mass.



ACME TORSION SPRINGS

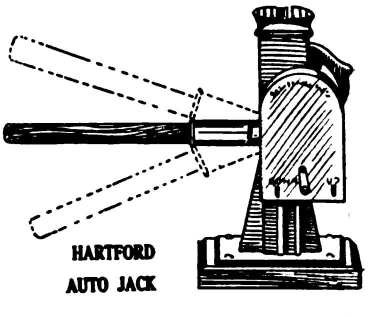
The Hartford Auto-Jack is intended to dispense with considerable of the back-breaking labor connected with raising a car off the floor or ground. To this end, a compound mechanism is utilized, so that the operator gains the benefit of increased leverage. In this way, the same weight is lifted an equal distance with less effort. It is said by the maker, the Hartford Suspension Company, Jersey City, N. J., that in a test a 4000-pound car required 90 pounds effort on the ordinary jack and but 30 with a Hartford. The casing is of tough malleable iron, the lifting rack cut from steel, while the steel gears are machine cut and hardened. Excellent material and workmanship make an article which is long lived, and efficient throughout its duration. This, combined with the lessened manual labor required should more than compensate for a small difference in price. The lessening of work done in jacking a car can easily be figured in considering a road accident where the machine slips off a highly crowned road into a soft, muddy ditch. Here the gain is little each time.



HARTFORD AUTO JACK

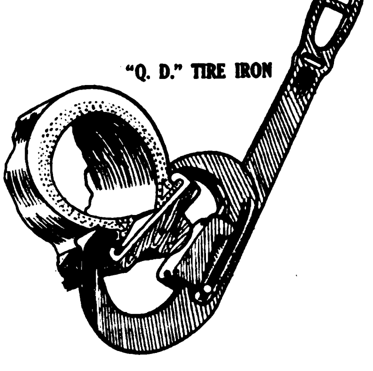
The Quick Detachable Tire Iron is a new tool for use with demountable, detachable or clincher rims, and is made by the Brookline Motor & Specialty Corporation, Brookline, Mass. This is produced with shaped faces which prevent the destruction of tires, either carelessly or unavoidably. It is so made, as the drawing shows, as to give the operator a very powerful leverage, by means of which tires that have rusted fast to the rims may be broken away with no other tools. In this respect, it should effect a great saving, for many tires which have become rusted fast and then punctured or blown out, are cut off in order to save the rims. With this tool, the shoes are saved also, and with little or no extra expense. It will be noted that the second or loose arm of the operating end is

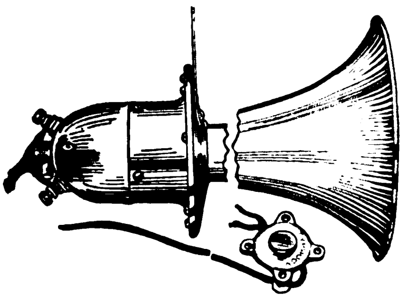


"Q. D." TIRE IRON

fastened to the body of the tool by means of a pin passing through a hole. There are a number of these, permitting the movement of this part to suit larger or smaller tires, and thus making it an universal tool.

★

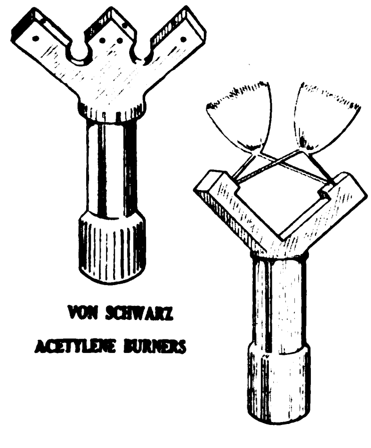
Typhoon Motor Driven Horns have been placed upon the market recently in response to a widespread popular demand for a low priced electric signal. It is the product of five years' experimental work upon the part of the maker, the Typhoon Signal Company, Chicago, Ill., and has two swinging arms revolving with the axis of the motor, which hit a set of interrupters, thus actuating a hammer to strike a diaphragm. By centrifugal force, these are retarded so that when the motor is in full action, the extraordinarily rapid motion of this little hammer produces a powerful blast at each stroke. This combines into a low, strong, deep signal that warns without frightening, while there is no internal wear. That the latter is a fact may be noted from the company's guarantee for two years. The current consumed is said to be a maximum of but two amperes on a six-volt circuit, making it very economical.



TYPHOON ELECTRIC HORN

★

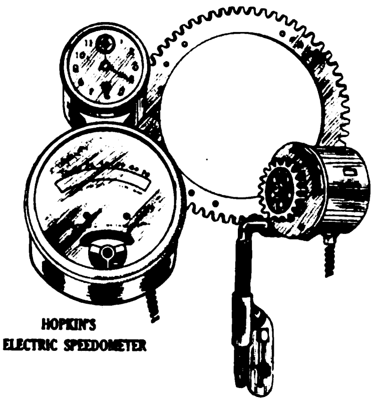
Von Schwarz Burners are intended for the better class of searchlights and lamps utilizing acetylene as a fuel. With the great increase in the use of this gas during the last year or so, has come a corresponding call for a better burner; one which will not only give a superior light but will not clog readily, and when wholly or partially closed will clean easily. In answer to this demand, M. Kirchberger & Co., Second avenue and East 22nd street, New York City, has brought out a number of different styles. The two shown in the sketch on this page carry the trade names, Searchlight and Twin, the former being shown at the left, and the latter at the right and slightly lower down. Both are twins actually, the Searchlight form having the two flames produced in parallel and in the same plane, while the other has two sources of light on two planes inclined slightly together, being perhaps .125 inch apart at the lava and about three times that at the apex.



VON SCHWARZ ACETYLENE BURNERS

★

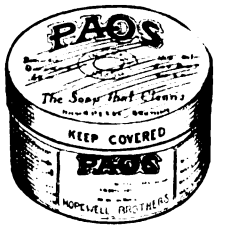
The Hopkins Electric Speedometer is a mileage measuring device which operates on an entirely new principle. It is well known that when a system of coils of wire is rotated within a permanent magnetic field, an electric voltage or potential is generated which is in direct proportion to the speed of rotation. In this accessory, made by the Electric Speedometer Company, Washington, D. C., advantage is taken of this by placing a small magneto generator on one of the front wheels, and gear driven from it. An indicating voltmeter is located on the dashboard, with a two-wire insulated cable connecting the two. By calibrating the latter in terms of the speed, a reading in miles an hour is obtained without the usual flexible shaft for transmitting rotations direct. To protect the lead wires from mechanical injury, they are covered with a flexible brass conduit, but the maker lays strong accent upon the fact that the whole system has no moving shaft to give trouble or make noise. An additional feature of this instrument is that it may be placed anywhere on the car with no more trouble than lengthening the cables. Due to its electrical action, the device is not affected by extremes of temperature. The usual trip, season and clock accessories are available.



HOPKIN'S ELECTRIC SPEEDOMETER

★

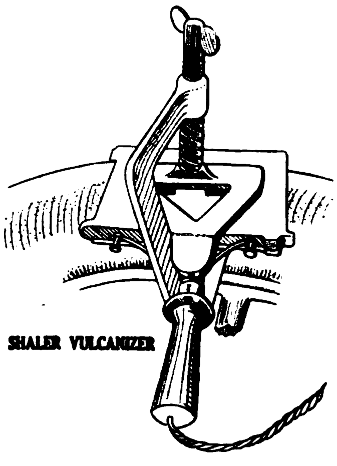
Paos, the new toilet soap, made by Hopewell Bros., Newton, Mass., while intended primarily for motorists would be equally useful to anyone having such work to do as would soil the hands. This, like all of the products of this concern, is made to sell on its merits, the name itself being taken from the word soap turned around, or as the maker phrases it, "Soap spelled backward, but a step forward in soap." It is a pure material, for washing, combined with a scourer, a detergent and an emollient to produce an aseptic cleanser. In use it forms a profuse lather, while due primarily to the emollient which it contains, the skin is left soft and with an agreeable feeling. A slight scent adds to the pleasure of its regular use. In color, it is white, and is put up in cans, about 3.5 inches in diameter and perhaps two inches high, the drawing herewith giving a good idea of the appearance.



HOPEWELL SOAP. PAOS

★

Shaler Vulcanizers, one form of which is shown in the drawing, are intended to prolong the life of tires and reduce the up-keep bills by attending to small injuries in either tube or casing before they have extended beyond the repairing point. They are made in a number of styles, sizes and shapes by the C. A. Shaler Company, Waupum, Wis., one of the largest makers in the country. The instruments are designed to utilize flame, steam or electricity, that shown being of the latter type, and arranged for direct current, such

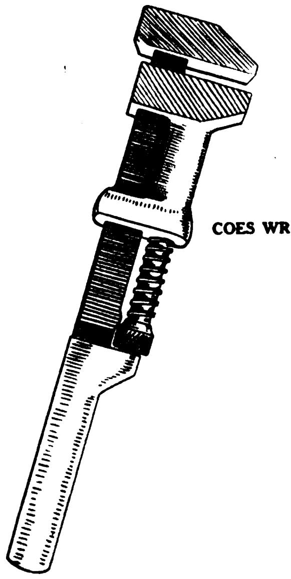


SHALER VULCANIZER

as the ordinary lighting circuit. This makes it possible to screw in the plug and do the work of repairing the tire surface while engaged elsewhere at other tasks. A prominent man who has used one of the Shaler portable direct current outfits for two years, comments on it as follows: "Before I had the device, I expected tire trouble every time I took the car out, but there is no longer any danger of accident or inconvenience from blow-outs on the road. I have done away with them by keeping all stone and glass cuts sealed up, thus preventing weakening and rotting of the fabric. I do not carry an extra casing now, while my tires last three times as long, and repair bill nil."

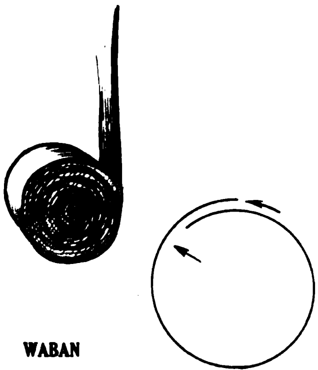
★

Coes Wrenches are known wherever mechanics are required, this tool having been a standard of excellence for some 50 years. Of late, considerable attention has been paid to the automobile trade, and all of the company's experience brought to bear on the production of a few models which would be serviceable to the motor car user more perhaps than any other form, but in addition carry all of the Coes ideas of material, workmanship and design. The result of this combination has been the production of a wrench which is almost unbreakable and cannot be worn out. It is claimed by the maker, that this product is 30 per cent. stronger. A rigid system of shop inspection, in which the components or finished articles pass through no less than 16 hands, insures that the material and work are up to the standard set. The simplicity of the construction is such that the number of parts is a minimum. One of these should be in every tool box. The maker is the Coes Wrench Company, Worcester, Mass.



COES WRENCH

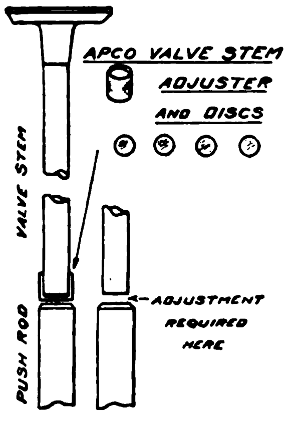
Bullet Proof Webbing is made by the Waban Webbing Company, Boston, Mass., for use, among other things, as an inner tube protector. When utilized thus, a strip of the fabric about one-quarter longer than the tube's circumference is wound around it and overlapped, as sketched herewith. For this specific use, the cloth is made of a correct width and shape so as to apply readily. It is a heavy woven material, substantially equal to five thicknesses of canvas, except that it is woven in a single piece. To avoid all possibility of requiring a smaller inner tube, the fabric is said to be very fine, while the edges are woven thin, with the web sinking into itself where the lap is made. From actual experiences, this form of tube strengthener gives 5000 to 7000 miles of rough riding, which is considerably in excess of usual tire mileages.



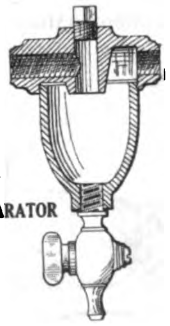
WABAN
BULLET PROOF WEBBING

★

Apco Valve Stem Adjusters, made by the Auto Parts Company, Motor avenue, Providence, R. I., are hardened steel caps to fit over the valve stems of cars not equipped with adjustable valve lifts, such as the Maxwell, Ford and E-M-F. With each set is furnished a quantity of steel discs to take up wear as necessary. Worm valve stems and pushrods cause noisy operation and loss of power. These adjusters can be fitted in an hour and will last as long as the car. They are guaranteed to be satisfactory or the purchase price will be refunded.



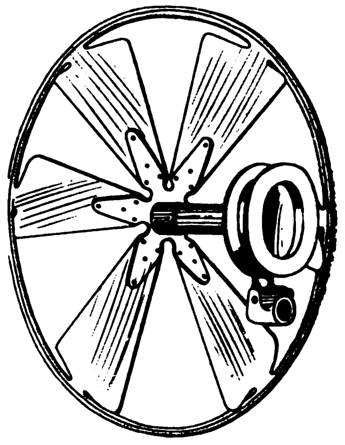
The Leavitt Gasoline Separator is a small but very serviceable accessory for the fuel supply system, which will save its cost many times over in the course of a season. It is made from brass by the Uncas Specialty Company, Norwich, Conn. The whole thing comprises but two parts, the filter and the well. These are connected by a taper thread so that no packing to come loose or give other trouble is needed. As the cut shows, the gasoline flows in at one side, down into the well, thence through the gauze strainer and out to the engine. It is customary practise to place these on the underside of the running board or at any other low point, so that the greater weight of the water will help the filtering action of the brass screen.



LEAVITT
GASOLINE SEPARATOR

★

Sparks - Withington Fans are made by the Sparks-Withington Company, Jackson, Mich., for cooling or assisting in cooling automobile engines. They are made from pressed steel, with a heavy wire rim over which the ends of each blade are turned. The drop forged hub carries a place for a small bearing, while, if desired, an extension arm and driving pulley also may be attached. This concern turns them out in large quantities, and its shipping facilities are of the best. The sketch depicts one of the so-called one-piece designs, but this may be modified in any particular to suit special cases.



SPARKS-WITHINGTON FAN

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS

The following companies have been incorporated recently to deal in motor cars, accessories, etc.:

Eureka Seat Company, Buffalo, N. Y.; capital, $10,000.

Union Garage Company, Adrian, Mich.; capital, $20,000.

K-R-I-T Motor Sales Company, Detroit; capital, $15,000.

Detroit Electric Company, Camden, N. J.; capital, $25,000.

The Joseph Cormier Company, Cleveland, O.; capital, $2000.

Sheridan Park Garage Company, Chicago; capital, $5000.

Munger Automobile Company, Dallas, Tex.; capital, $2500.

City Auto Repair Company, Hartford, Conn.; capital, $50,000.

King Automobile & Repair Company, Charleston, S. C.; capital, $5000.

National Motor Starter Company, Grand Rapids, Mich.; capital, $10,000.

Cayce-Jones Motor Car Company, Louisville, Ky.; capital, $10,000.

Overland-Rochester Company, Rochester, N. Y.; capital, $30,000.

Mechanical Rubber Tire Company, Jersey City, N. J.; capital, $100,000.

Creston Auto Company, Grand Rapids, Mich.; capital, $4000.

Green Bay Motor Company, Green Bay, Wis.; capital, $25,000.

Smith Gasoline Meter Company, New York City; capital, $350,000.

Stone Harbor Garage & Marine Railways Company, Camden, N. J.; capital, $75,000.

Merchants Motor Car Company, 530 Essex building, Newark, N. J.; capital, $500,000.

Clenol Manufacturing Company, Muncie, Ind.; capital, $10,000; incorporators, George Lewis and others.

James G. Barclay, Inc., Buffalo, N. Y.; capital, $25,000; incorporators, J. G. Barclay, G. M. Kohl, E. Barclay.

Harbeck Motors Company, Chicago; capital, $50,000; incorporators, A. T. Ewing, E. S. Hartman, C. Bednor.

Heater Muffler Company, Elmira, N. Y.; capital, $50,000; incorporators, W. Kinzie, L. D. Curran, A. G. Ingham.

Sterling Top & Equipment Company, Jersey City, N. J.; capital, $50,000; incorporators, F. Grundy, W. C. Rands, G. Copp.

Manhattan Top & Body Company, New York City; capital, $50,000; incorporators, G. B. Radford, H. Schuler, C. D. Heintze.

Madden-Copple Company, Indianapolis, Ind.; capital, $1000; incorporators, Thomas Madden, Elbert Copple, Thomas E. Madden.

The S. R. Manufacturing Company, Schenectady, N. Y.; capital, $50,000; incorporators, Christian Steenstrup, Karl M. Rossi, Ralph J. Ury.

Baker Bros. Motor Company, Buffalo, N. Y.; capital, $10,000; incorporators, Edward A. Green, Edward H. Baker, Clarence W. Baker.

International Motor Company, New York City; capital, $10,000,000; incorporators, Richard S. Aldrichs, Graham Foster, Joseph A. Bennett.

Frank A. Reeve Company, Montclair, N. J.; capital, $50,000; incorporators, Frank A. Reeve, John Butler, David H. Slayback.

The Evergreen Motor Car Company, Evergreen, Conecuh County, Ala.; capital, $2000; incorporators, C. P. Deming, E. W. Dunn, R. L. Whitcomb.

Amplex Motor Company of New England, Boston; capital, $25,000; incorporators, Isaac B. Spafford, William M. Turner, William B. Foster.

Osgood Motor Car Company, Brooklyn, N. Y.; capital, $10,000; incorporators, Samuel Miskind, 178 Hewes street; Paul W. Smith, Irving J. Joseph.

The M. D. Moore Manufacturing Company, Waveland, Ind.; capital, $2000; incorporators, M. D. Moore, J. W. Robertson, J. R. Sharp, J. D. Fisher.

Memphis Motor Car Company, Memphis, Tenn.; capital, $12,500; incorporators, J. T. Fisher, D. M. Armstrong, A. Goodman, Walter L. Berry, T. K. Cresson.

Baker Taxicab Company, Dayton, O.; capital, $10,000; incorporators, George L., Frank R. and Harry W. Baker, John Van Deman, Charles D. Heald.

Fear Naught Company, New York City; capital, $100,000; incorporators, R. T. Hughes, J. M. Davis, F. C. Munson.

Blackburn-Allen Company, Dayton, O.; capital, $30,000; incorporators, E. E. Allen, W. J. and M. A. Blackburn.

The Aquilas Aeroplane Company of Astoria, Brooklyn, N. Y.; capital, $5000; incorporators, John B. Felicetti, Gennaro Bescigno, Charles Fity.

Derby Automobile Race Company, Los Angeles, Cal.; capital, $100,000; incorporators, A. F. Scherfenberg, J. E McReynolds, C. I. Reynolds, O. V. Traggard.

Snora Motor Horn Company, New York City; capital, $50,000; incorporators, A. F. Foshay, G. Goldman, H. Neubardt.

Moran's Garage & Auto Company, Jersey City, N. J.; capital, $25,000; incorporators, W. A. Higgins, O. R. Moran, J. E. Moody.

Ross Machine Company, Lafayette, Ind.; capital, $15,000; incorporators, William, David E., Linn C. and Edward A. Ross.

American Roller Bearing Company, Camden, N. J.; capital, $100,000; incorporators, V. A. Murray, L. A. Myers, D. Bellinger.

Divine Tire Demonstrating Company, Utica, N. Y.; capital, $10,000; incorporators, Bradford H. Divine, Edmund D. Munson, T. Harvey Ferris.

Reliable Tire Repair Company, Peoria, Ill., 633 Main street; capital, $2400; incorporators, John V. Leslie, George Haas, Bert A. Fritz.

Weaver Aviation Company, New York City; capital, $10,000; incorporators, John Weaver, Indianapolis, Ind.; George G. Johns and H. W. Kelly, New York City.

Rio Grande Automobile Company, El Paso, Tex.; capital, $5000; incorporators, Max Moye, W. F. Carter, Jr., John M. Wyatt.

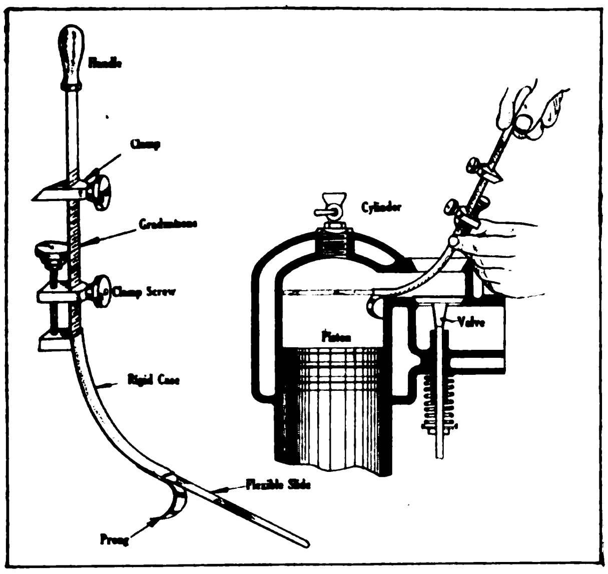
It is proposed to have the attendants uniformed.

Samuel W. Scott, formerly of Seaford, Del., has joined the sales force of the New England branch of the Velie Motor Vehicle Company, Moline, Ill., at Boston, and will take charge of the business in that district.

MECHANICAL POINTERS *for* GARAGEMEN AND OWNERS

MEASURING CYLINDER BORE.

It is not a difficult matter to measure the internal diameter or bore of an automobile cylinder when the latter is on the bench, but it is a problem of some magnitude to ascertain this information with some degree of accuracy when the cylinder is in its place on the engine base. An internal caliper by which the diameter of the bore may be quickly ascertained is shown at Fig. 1, this device having been patented by a London firm.



Handle
Clamp
Graduations
Clamp Screw
Rigid Case
Flexible Slide
Prong
Cylinder
Piston
Valve

Fig. 1—Measuring Cylinder Bore Without Removing It from the Engine.

A graduated flexible steel blade slides through a curved rigid socket which is provided with a steel prong at the lower end and a locking clamp at the other extremity. The end of the instrument is inserted through a valve port, in either an L or T head cylinder, and the curved prong is pressed against one of the cylinder walls. The graduated blade is pushed through the socket until its point is felt to touch the opposite side of the cylinder, when the diameter is at once indicated by the scale at the end of the socket.

While considerable dexterity is needed to take absolutely accurate measurements with this device, because of the liability of the flexible member to spring or the possibility of inserting the tool so the blade will be on an angle instead of parallel with the top of the piston, one may become very expert with practise. This measuring caliper is very valuable for officials at motorcycle, power boat or automobile races, to determine the bore of an engine in case of doubt. Another type is made that can be inserted through a spark plug hole or an overhead valve port when the engine has cylinders with valves in the head instead of at the side. The locking clamps and the adjustment screw permit one to retain measurements if necessary.

USEFUL COMBINATION TOOLS.

In endeavoring to reduce the number of tools needed by the mechanic, various inventors have designed combination tools in which several different utensils are grouped on one main element or handle. Some of these are complicated and not specially adapted to do any one thing well, and while they have diversified uses, they seldom appeal to the practical mechanic because of their cumbersome appearance and the difficulty involved in handling them. Some inventors have designed more practical tools, and a number of special combinations recently patented, which appear to have some value, are shown at Fig. 2.

The device shown at A gives one the choice of a hammer having the usual face and a flat riveting pein suitable for light work, a pair of pincer jaws and a divider or compass that may be utilized either in taking measurements or drawing circles, as the case may be. Each tool is thus distinct, and the form of the instrument is such that one could use any one without much interference from the others.

The soldering iron outlined at B is a very practical fitting that will appeal to the mechanic because of the large number of positions the copper bit may assume. This is provided at the lower end with a steel ball that fits a two-jaw chuck suitably formed to contain it. When one unscrews the handle, the

pressure against the ball is released and the bit can be set at any angle desired, after which the handle is turned in the reverse direction and the ball firmly clamped between the chuck jaws, thus holding the copper bit in place.

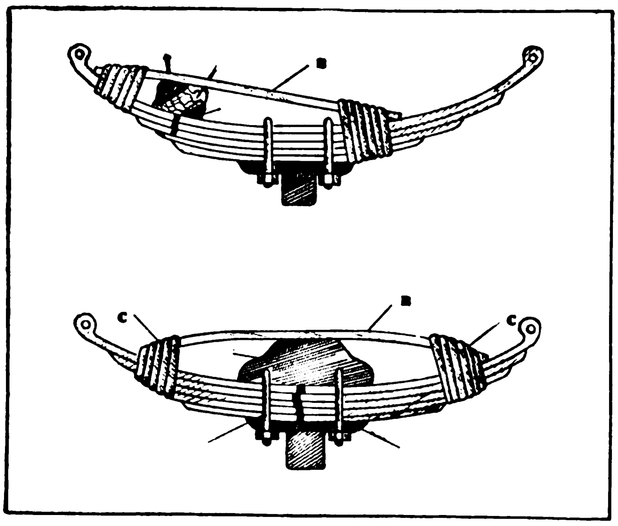

Fig. 3—How to Make an Emergency Repair of a Broken Spring.

That depicted at C offers a combinatnon of practical tools that should prove very valuable about the motor car or boat. One of the handles serves as a screw driver, and the back of it as a rack and support for the adjustable wrench jaw. The fixed and movable wrench elements are provided with serrated pieces, enabling one to use it either on pipes or bolts or nuts. Between the plier jaws a wire splicing groove is cut, and a serrated opening close to the fulcrum acts as pipe pliers if one desires. A wire cutter and hammer head are also provided.

The combination wrench illustrated at D combines in one simple tool two forms of wrench, both of which are thoroughly practical. The fixed portion of both nut and pipe wrench is formed by a forging having teeth cut on its back which the adjusting worm engages. The movable wrench jaws are a separate forging as indicated. One good feature of this wrench is that the handle length becomes greater as the opening between either set of jaws is augmented, this making for greater leverage at a time it is most needed.

TEMPORARY SPRING REPAIRS.

Considerable improvement has been made in spring construction resulting in increased elasticity of the metal employed, so that spring breakage is comparatively rare, being due generally to overloading or because of fatigue of the metal. Springs break in various places although most commonly in the centre between the spring clips or in proximity to these fastening devices as shown in Fig. 3. While these clips will hold a spring together, the ends are liable to sag and put a dangerous strain on the fasteners. An emergency repair can be made of a broken spring as indicated in the accompanying sketch.

A hardwood board B, from one inch to two inches thick, should be procured, and its sides trimmed so that it will be about five inches in the centre and two or three inches at the ends. Drive the nails CC in the ends of the board, lift the frame of the car by a jack to take the weight off the spring, put the centre of the board on the rubber bumper, or, if there be no bumper, on a block of wood. The ends of the board are then bound tightly to the springs with straps, wire or rope.

If the break be near the end as shown in the sketch, the block of wood should be nailed to the board over the break. The operation of fastening is practically the same as shown and described in the centre break. A repair can be made by interposing a large block of wood between the frame and axle, to take the entire weight. This remedy is practical when the spring is broken beyond repair.

SIMPLE ATTACHMENTS FOR WRENCHES.

Two useful attachments that can be easily fitted to the ordinary type of monkey wrench to make it suitable for working on pipe are shown at Fig. 4. That outlined at A is a simple pipe cutter comprising a jaw member having a recess to receive the jaw of the wrench, this being provided with parallel arms adapted to straddle the shank of the wrench. A cutting wheel or roller is mounted in a block sliding in and guided by a suitable yoke piece. This can be moved as desired by turning the handle on the feeding screw. Simple clamp screws insure that the attachment will be easily and quickly secured to the wrench. The pipe is placed between the movable jaw of the wrench and the roller, and is backed by the shank of the tool. The device is used in the same manner as a pipe cutter, the wrench being revolved around the pipe and the pressure on the cutter block being increased gradually to cut deeper into the pipe each revolution.

The device shown at B is an extremely simple member having a series of serrations or teeth to permit it to grip a round surface. This is made of hardened steel and has a simple clip member by which it may be easily attached to the fixed jaw of the wrench. The U shaped plate is adapted to closely engage the top and sides of the wrench jaw, the serrated plate is pivoted to the plate to lie beneath the face of the fixed member. A locking member composed of a pin having a grooved end and retention spring is passed through the U member back of the wrench shank to hold the attachment in place. The spring catch engages the groove in the pin when the latter is in position as indicated.

Notes on Wood Finishing—For all coarse grained woods that have to be filled it is best to put on, after filling, a thin coat of shellac, colored to suit the color of the wood. It acts as a binder, keeps the wood from changing its color and prevents the varnish from sinking too deep into the grain of the wood.

All coats of stain, shellac or filler need to be lightly sandpapered and cleaned of all dirt before putting on the finishing coats of varnish or hard oil.

All coats of hard oil or varnish should be rubbed with fine pumice stone mixed with linseed oil for egg stone and water for rubbing. For a polished finish, rub first with fine pumice stone and water and then shell gloss. For a dull finish, use powdered pumice with fine rotten stone and water.

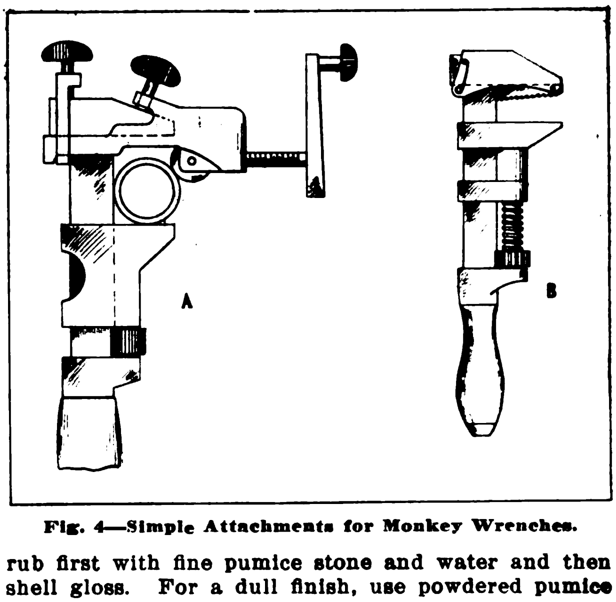

Fig. 4—Simple Attachments for Monkey Wrenches.

DRIVING THE LATHE BY MOTOR CAR.

An owner, who was mechanically inclined and did his own repairing, possessed a foot lathe which he utilized for light machine work. In preparing to overhaul his car he noted that considerable work of this nature would have to be done. Not wishing to go to the expense of taking this to a machine shop, he conceived the idea of using a small runabout as a means of supplying power, driving a flexible cable from the rear wheel of the automobile, as shown in the illustration herewith, Fig. 5. A is a flexible shaft about three feet long with ferrules brazed on either end. Each ferrule is drilled for the purpose of pinning couplings C and D which are made of .25-inch by one-inch soft steel with .4375-inch holes bored in each end. The coupling D is riveted to another coupling B, which is fastened to the felloe of the motor car wheel.

A hole .375 inch in diameter is drilled through the lathe shaft and coupling C, both being held together with a .375-inch bolt and nut. The coupling pins on the cable should be made of a suitable gauge brass wire, so in case the lathe becomes jammed the pins will shear off, preventing possible damage to the motor car wheel. The speed of the lathe is varied either by shifting the change speed gears of the automobile or by throttling, or both. The flexible shaft could be driven by a small gas engine and used for drilling, polishing, etc.

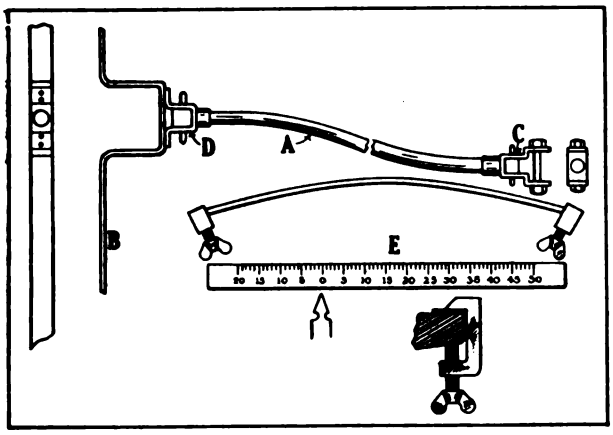

Fig. 5—Some Repair Kinks for the Owner Repairman: Upper Sketch, Method of Driving Foot Lathe by Motor Car Wheel; E, Valve Timing Gauge.

SPLASHGUARDS FOR AUTOMOBILE WHEELS.

The municipal authorities of a number of cities in Europe, notably in London and Paris, have taken under consideration the complaints of pedestrians, who use the thoroughfares where motor vehicles are numerous that mud baths are forced upon them every wet day by motor 'buses, trucks and pleasure cars which splash through the puddles of water collected near the curb or at the crossings. As a result of this, tests have been made of a steel or brass wire mesh guard designed to keep the mud from flying outward when a wheel drops into a pool of water.

One of the splashguards that has been successful in the trials is shown at Fig. 6. As will be obvious, it is suspended from the hub of the wheel, the bottom reaching to within a small fraction of an inch of the ground, thus forming a shield between the wheels and the sidewalks. The mesh is attached to a broad fan shaped piece of metal, provided with a journal at one end which is designed to turn with hub of the wheel, whereas the shield is kept from revolving by the tension spring attached to the end projecting a little above the hub and anchored to the mudguard.

In one of the tests a white screen was erected on a suburban road near London, in close proximity to a large puddle of water. A motor omnibus was equipped with the shields and driven through the pool at various speeds. Only a few small drops of mud were splashed upon the screen when the splashguard was fitted to the wheel, while a very pronounced effect in black and white was noted on the screen when the guards were removed. As will be evident, these are easily made, should not be costly and need only be used on stormy days.

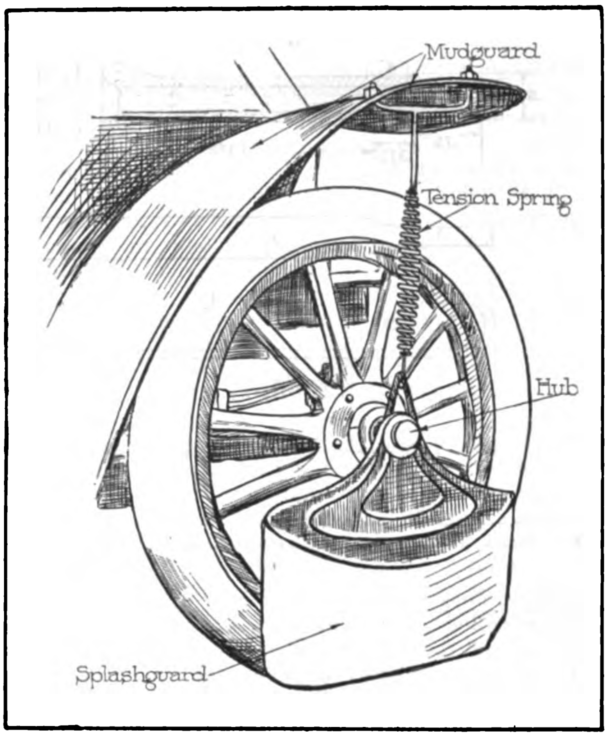

Fig. 6—Splashguard for Automobile Wheels.

ATTACHMENT FOR TWO-STROKE ENGINES.

One of the problems confronting designers of simple two-cycle engines, in which base compression is depended upon to transfer the gas to the cylinder of the motor is that of positive transfer at low engine speeds. This is particularly true when the throttle is partly closed and the quantities of gas inspired into the crankcase are not large enough to be properly compacted so that sufficient pressure is obtained to insure prompt gas flow from the base compartment to the combustion chamber.

At low speeds, one usually experiences some trouble in having a two-cycle cylinder fire regularly if the engine speed is regulated by the throttle in the carburetor. At the other hand it is not desirable to depend upon a retarded spark to slow the engine because of the excess heat developed and poor fuel

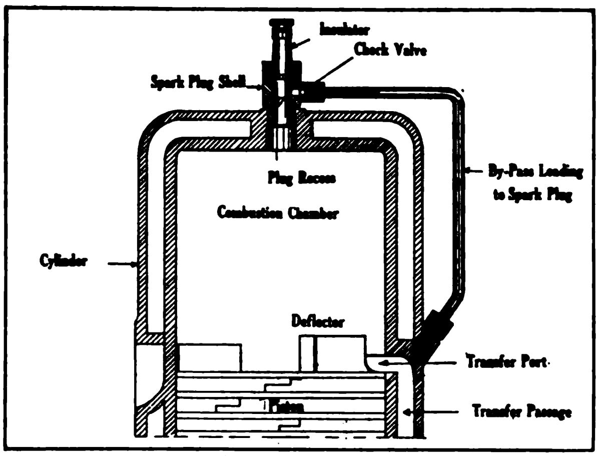

Fig. 7—Simple Gas Bypass for Two-Cycle Engines.

economy. One of the reasons for poor action is that the attenuated gas supplied the cylinder at small throttle openings and consequently low crankcase pressures does not ignite as readily as the richer mixture supplied at higher speeds and open throttle. Then again the burnt gas is not removed from the cylinder as completely as when the incoming charge has greater pressure. The result is that some of the residue will remain in the cylinder, and as this is lighter than the cold entering mixture, it is forced to the top of the combustion chamber.

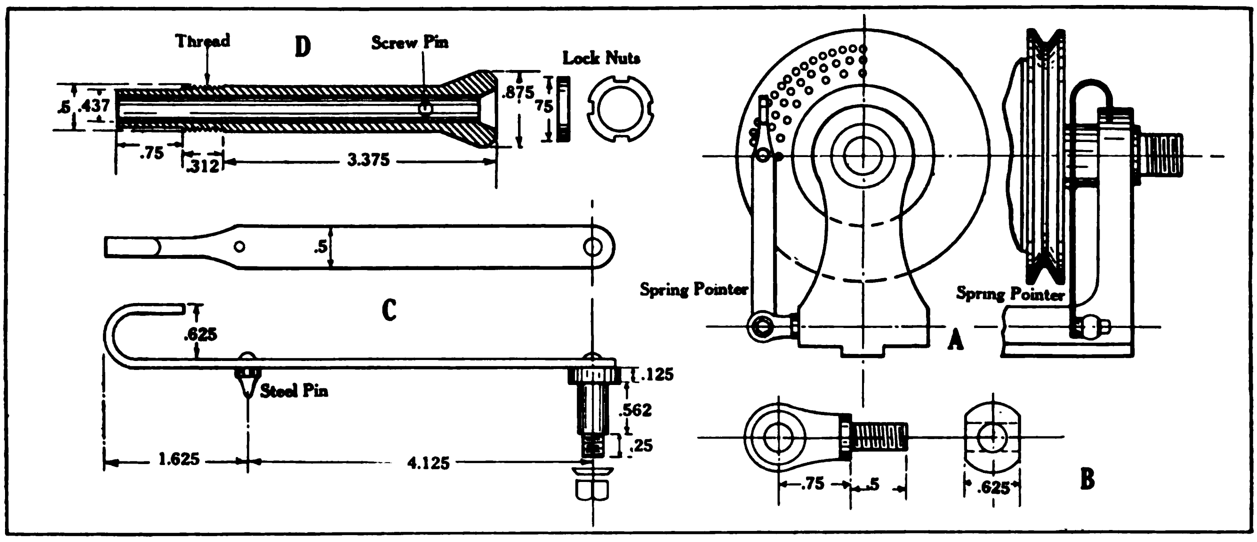

Fig. 8—A, Dividing Plate Attachment for Lathe; B, Pin Utilized for Attaching Spring; C, Construction of Spring Pointer; D, Drilling Spindle.

In an engine of the design shown at Fig. 7, a portion of this inert and non-combustible gas will collect in the pocket under the spark plug, and instead of the plug points being in fresh gas which will ignite readily, they are surrounded by good and bad mixture that will not kindle as quickly as the pure gas charge. When the spark takes place, it does not always fire the gas around the plug points and the engine misses fire. In fact, even at high engine speed, one may retain a certain portion of the burnt gas in the combustion chamber, with the result of weakening the explosions because of the slow combustion due to the impure gas immediately adjacent the plug points.

A simple method of insuring that the spark plug will be surrounded with fresh gas has been patented by Arthur H. Webber, Boston, Mass., and is shown at Fig. 7. It consists of providing a small bypass pipe from the transfer port to the spark plug shell. This is a special type having a deep pocket which provides considerable space around the spark plug insulator. A portion of the compressed charge in the crankcase is supplied this chamber through the ball check valve in the spark plug bushing, and when the spark takes place, the fresh mixture surrounding the electrodes is immediately ignited, this in turn firing the gas contained in the combustion chamber of the engine. As a portion of the fresh charge is transferred to the plug even at low engine speeds, the spark always occurs in explosive mixture. This should make for steadier running at both low and high engine speeds, as well as cleanliness, and keep down the temperature of the spark plug insulator, thus minimizing trouble due to sooty accumulations or cracking of the porcelain because of the excessive heat.

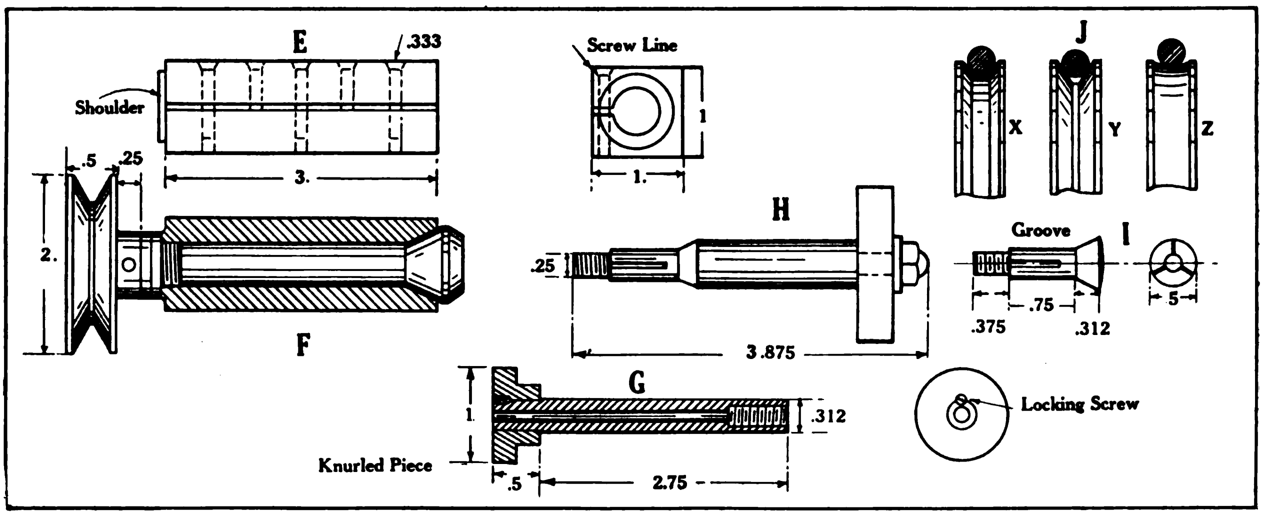

Fig. 9—E, Holder for Drilling Spindle; F, Section of Drilling Device; G, Draw Spindle; H, Chuck for Small Emery Wheel; I, Spring Chuck; J, Types of Pulley Grooves.

ACCESSORIES FOR THE LATHE.

Numerous fittings may be applied to the lathe to facilitate the work of the repairman, some of which are indicated in the sketches, Figs. 8 and 9. Where this device is utilized for milling, wheel cutting and tap fluting, it is essential that a dividing plate be attached to the pulley, and at A is presented an attachment of this nature.

Sometimes the face of a pulley on the spindle is wide enough for two, three or four rows of holes as shown in the illustration. Four circles, containing respectively 60, 80, 84 and 96 divisions, will give a wide range for wheel cutting, etc. If it be impractical to drill the face of the pulley, a brass plate can be attached, it previously having been divided as suggested above.

At A also is shown the spring pointer device and its method of attachment. It is made from a piece of flat steel, .0625 inch thick and .5 inch wide to the dimensions depicted at C. The steel pin is riveted into the plate. Its point should be hardened, and of such size as to fit into the holes drilled in the dividing plate shown at A. The top of the spring is bent to form a handle. At its other end is riveted another pin which fits into a drilled hole shown at B, and the member is held by a small nut and washer. This, when finished, is screwed into its correct position and into a .3125-inch tapped hole in the headstock casting, and the spring, seen at C, so adjusted that it firmly holds the lathe spindle in any desired position.

When not in use it may be moved out of the way without disturbing the connecting nut at the bottom. Before drilling the piece shown at B, it should be screwed into the casting right up to the shoulder and the position for the hole marked. It is then unscrewed, drilled through, and faced up on both sides, by pushing it tightly on a turned pin held in the chuck. If so desired, the index pointer can be attached to the opposite side of the headstock.

Drilling Spindle.

A small drilling spindle that may be utilized in connection with the dividing plate, and may be used in an endless variety of work in drilling, fluting, keyway cutting, square, hexagon or octagon milling, in steel, brass, etc., may be constructed as indicated at D. The body of this device is made from a three-inch length of mild steel, one inch square. This is drilled through and then finished with a reamer to .5-inch diameter. The bore should be quite smooth and parallel with that part of the holder which rests on the cross slide when in use.

A pin, or spigot, is held in the chuck and turned until it fits nicely into the hole in the holder, which is shown at E. The ends are next faced up on the pin, and trued with the bore, leaving a small shoulder as indicated in the illustration. The other end is coned out accurately to an angle of 40 degrees; that is, the top slide is set over that amount. It is then sawed through one side, and the burr carefully removed from the inside. The three .125-inch screws, shown at E, are tapped into the lower half of the holder. The three shorter ones fit into the upper half, as illustrated. The three former when tightened, tend to draw the parts together, while the three latter are utilized for expanding the holder.

When finished, the holder should be case hardened all over. It may be slightly out of true after the process and require lapping. The spindle for this member is shown at D. It is turned from a piece of .875-inch mild steel, and to the dimensions given. First, drill through its centre with a .28125-inch drill, then finish the bore with a D-bit made from a length of .3125-inch silver-steel. At the small end shown at D it is turned parallel to take the pulley presented at F, which, when finished, is attached to the spindle with three .15625-inch grub screws, the points fitting into slightly countersunk holes therein.

A 26-thread is then cut at the small end to which reference has been made previously, to take two lock nuts. A .109375-inch hole is drilled and tapped for an .125-inch grub screw, which is screwed in just below the outer diameter of the spindle. It is filed as noted in the illustration, and projects through on the inside about .046875 inch. The finished diameter of the spindle is about .5 inch. This, however, should be left about .005 inch larger, then case hardened, and afterwards ground to a nice running fit in the holder. At F is shown the device assembled. The .125-inch long screws at E, are utilized for adjustment.

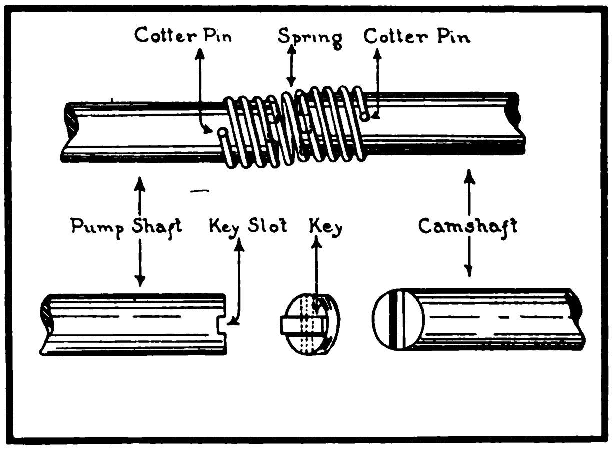
Draw Spindle.

A draw spindle, presented at G, can be made from stout .3125-inch steel tubing. It is tapped at one end to take the spring chuck shown at I, this being standard, having a groove that fits over the screw pin at D, which is filed to correspond. The other end of the spindle is shouldered down to take the knurled piece shown at G, which is forced on. A .125-inch screw is utilized to prevent its turning when being tightened.

A chuck for the purpose of holding a small emery wheel is shown at H. This device will be found useful for a variety of purposes such as tap, reamer and cutter grinding, or for use on external work. J illustrates three examples of grooves in small pulleys. When turning these, if grooved as shown at X, the gut, or whatever material is used, is only gripping at one point, and would have to be drawn tight to enable it to drive a cutter or similar tool. Z is also faulty in this respect, while Y shows the correct method, the maximum of power being obtained with a minimum of friction.

PUMP COUPLING DEVICES.

Where a key is utilized to form a connection between the driving shaft and pump in the water circulation system, the design is such that the space occupied by it is very small. If the slots into which this fits become worn, the stock part cannot be used and it is necessary to make a new one. Similarly, if the shafts be not aligned, the coupling will be bent and twisted out of shape by the eccentric motion imparted.



Some Pump Key Hints: A, Practical Device Where Keyways Are Out of Line; B, Spring Coupling.

The writer recalls an instance where an owner was obliged to make frequent replacements of this nature and sometimes these occurred while on the road. At last the keyways became so worn that a special key had to be made, which failed to last for any length of time. Upon close examination it was found that the trouble was due to the shafts not being in a line. The construction of the pump was such that it would not permit of filing the bolt holes without weakening the member and to overcome the stresses of misalignment a coupling, like that shown in accompanying sketch, was suggested.

The key slots were first filed true and measured. A piece of round steel, small enough to slide easily between the shafts, was centred on one side, measured and cut with a hacksaw. This was then filed to make a loose fit with one slot, while the other side was treated in like manner. The pump was replaced and no further trouble was experienced although the car was run several thousand miles.

Another method is also shown and this can be employed where the shafts are considerably out of alignment. It consists of a stiff spring the ends of which are fastened to the shafts by large cotter pins. Holes are drilled to take these, the ends of the spring being hooked into the heads of the holders. The former should be closely wound and so attached that when the shaft revolves it winds up the coil.

INFLUENCING RATIONAL LEGISLATION.

Trade organizations directly identified with the motor vehicle and allied industries are not to be condemned because of absence of enthusiasm and energy, which appears to be a condition frequently realized, but should be critcised because of actual losses resulting from apathy and failure to act when action would accomplish a great deal.

Probably no class of business men suffers through obnoxious legislation as does the automobile trade. Year after year unreasonable measures are continued in effect or drastic amendment to existing laws is made simply from the unwillingness or refusal of the business men to act as will protect their own interests and relieve the motoring element.

There is no reason why the automobile trade and social organizations cannot unite and present demands with such sound argument, and with such weight of personal influence, that the desired amendments to the statutes will be no longer denied.

PROMOTION OF BUSINESS.

Whatever will promote the use of pleasure automobiles is directly stimulative of business. By this is meant that communities that can attract motorists invariably receive ample return from visitors, and conditions that will make for safe traffic must always be commended. With a very large proportion of the motorists the evenings are given over to driving and for the safeguarding of all proper precaution should be exacted from people and from users of vehicles alike.

Probably no greater influence for good can be specified than carrying lights on all forms of road conveyance. This is required by the Massachusetts and Connecticut laws, but in the majority of states only motor cars must be lighted. With traffic constantly increasing the dangers will multiply and common sense would dictate that there be not only lighting of every type of highway transport but codes of signals that will indicate conditions that may be obscured even with the best of illuminating equipment. No good reason can be offered for rejection of the proposal, and every argument made must be favorable to it.

WHAT IS A COMPLETE STOCK?

One of the greatest factors in business success is buying well. This does not necessarily mean large purchases, but in renewals of stock that can be sold with and without reference to seasons. One of the best business men in the automobile accessory trade advises that the comparatively small dealer carry a stock in which his capital will not be tied up in lines that can only be sold during climatic extremes, or which may be only in occasional demand, no matter what the inducement offered by the salesman, but be willing to take a smaller margin of profit, replenishing as occasion requires. With other classes of goods it is wise to consider the needs of the motorists and purchase what will sell readily. A complete stock is in a sense made up of staple goods, and what cannot be sold without special effort is not desirable at any price. In other words, there should be care taken to stock only what is demanded and what has been well advertised.

THE VALUE OF CREDIT.

The greatest asset of any business man is his credit. It may be that credit will not be sought but that it is not is one of the strongest recommendations for a firm or corporation. Taken as a whole there is not as great confidence in many automobile and allied trade propositions as there should be, and this condition reflects upon all as well as directly affecting those who, often requiring accommodation, find conditions imposed that necessarily limit their business activities. Often the cause is neglect of business details and losses through confidence that has been abused, but be that as it may the only one who really suffers is he who is, after all, responsible for his own affairs. It may be pointed out that he who is careful of his credit usually has all he needs.

APPLICATION OF METHOD.

Whatever the ideal, whatever the purpose, whatever the system, there can be no result obtained unless endeavor is made to apply methods. In this sense it is apparent that business success is entirely dependent upon the controlling mind, and that nothing can be accomplished without effort. It is as imperative to make application of method in business as it is to employ capital.

Portland Garage, Portland, Me. (Portland.)

UNIVERSAL JOINTS.

Bretz Co., J. S., 250 W. 54th St., New York City (Hartford.)

VALVE STEM ADJUSTORS.

Auto Parts Co., Motor Ave., Providence, R. I. (Apco.)

VARNISHES FOR AUTOMOBILE BODIES.

U-Auto-Varnish Co., Cleveland, O.
Branch: 218 Columbus Ave., Boston, Mass.

WASHING DEVICES FOR GARAGES.

Perfect Mfg. Co., Albany, N. Y.

WELDING AND WELDING PROCESSES.

Welding Co., The, 51 Bay St., Springfield, Mass.
Branches: 63 Southampton St., Boston, Mass.; 46 Elm St., Hartford, Conn.

WINDSHIELDS AND WINDSHIELD CLEANERS.

Conover & Robinson, 244-252 W. 54th St., Motor Hall, New York City (Boreas.)

Gabriel Horn Mfg. Co., 1421 E. 40th St., Cleveland, O. (Cleaner.)

WIRE MECHANISM.

Bretz Co., J. S., 250 W. 54th St., New New York City (Bowden.)

WRENCHES AND COMBINATION OUTFITS.

Beck Co., The, Box 67c, Rockville Centre, N. Y.

Coes Wrench Co., Worcester, Mass.

Cutter, Geo. A., Taunton, Mass.

Walworth Mfg. Co., Boston, Mass. (Stillson.)

Leading Concerns in the Industry

Buyers Use This Guide

Representative houses in all branches of the industry are to be found in this index. When purchasing look for names, addresses and product wanted, under proper classified heading.

ACCESSORY MANUFACTURERS AND JOBBERS.

Bi-Motor Equipment Co., 177-179 Portland St., Boston, Mass.
Branch: 113 Massachusetts Ave., Boston, Mass.
Hopewell Brothers, Newton, Mass.
Branch: 1974 Broadway at 67th St., New York City.
Lucas & Co., Brookline, Mass.
Miller, Chas. E., 97-103 Reade St., New York City.
Branches: 202-204 Columbus Ave., Boston, Mass.; Bridge and Dwight Sts., Springfield, Mass.; 274 Trumbull St., Hartford, Conn.; 924 Eighth Ave., and 2782 Broadway, New York City; 1421 Bedford Ave., Brooklyn, N. Y.; 318 North Broad St., Philadelphia, Penn.; 824 Main St., Buffalo, N. Y.; 1829 Euclid Ave., Cleveland, O.; 227 Jefferson St., Detroit, Mich.; 66 Edgewood Ave., Atlanta, Ga.; 601-603 Baronne St., New Orleans, La.; 135 Central Ave., Albany, N. Y.; 274 Halsey St., Newark, N. J.
Milwaukee Auto Specialty Co., 128 Second St., Milwaukee, Wis.
Waite Auto Supply Co., 81 Exchange place, Providence, R. I.

ACETYLENE TANKS.

Prest-O-Lite Company, 271 East South St., Indianapolis, Ind. (Prest-O-Lite.)
Branches: Atlanta, Baltimore, Boston, Buffalo, Chicago, Cincinnati, Cleveland, Dallas, Detroit, East Cambridge, Jacksonville, Kansas City, Long Island City, Los Angeles, Milwaukee, Minneapolis, New York, Oakland, Omaha, Philadelphia, Pittsburg, Providence, San Francisco, Seattle, St. Louis and St. Paul.

VOL. I. PAWTUCKET, R. I., DECEMBER, 1911. No. 2

COMING MOTOR VEHICLE DISPLAYS

Attracting Attention of Every Active Enterprise in the Industry—Garden, Palace, Salon and Chicago Shows All More Pretentious Than Ever Before—Record Attendance and Business Assured.

THE proximity of the exhibitions of motor vehicles regarded as national has attracted the attention of every active enterprise in the industry. The first is to be held at New York, that at Madison Square Garden beginning January 6 and continuing until January 20, to be followed by the second at the Grand Central Palace, from January 10 to 17 inclusive. The displays have greater attraction than ever before because of the fact that they are not competitive and the one in a sense is as representative as the other.

The Madison Square Garden show is conducted in behalf of the Automobile Board of Trade by the show committee of that organization, which consists of Alfred Reeves, sales manager of the United States Motor Company; Col. George Pope, treasurer of the Pope Manufacturing Company, and Merle L. Downs, the latter serving as secretary and executive of the show committee. These men are in every way experienced in the conduct of automobile shows and with their knowledge and capacity there is every reason to believe that the exhibition will be the most complete and interesting that has ever been held at the Madison Square Garden.

Following the custom inaugurated a year ago the first week of the show will be devoted to pleasure vehicles and the second to industrial or service conveyances, and in connection with these displays will be an unusually complete showing of accessories. The pleasure vehicle show will include 60 different makes of cars, and among them will be the oldest and best known machines built in this country. There will be 56 gasoline cars and four electrics shown, of which but two are new makes, the Flanders electric and the S. G. V., made by the S. G. V Company at Reading, Penn.

The power wagon division of the show will include 32 different exhibits, of which six will be electric vehicles. Of these the product of the Bronx Electric Vehicle Company, the General Motors Company and the Ward Motor Vehicle Company will be shown for the first time. The machines will range from the light delivery wagon to the heavy six and a half ton truck, while all manner of body equipment will be displayed.

The motorcycle display will be made during the week the pleasure cars will be shown and in this classification will be seen 16 different makes of machines. The number is larger than ever before and it is expected that this section will be unusually attractive and interesting. The exhibits will include all of the well known makes, and for the first time several of the Western machines will be shown at the Garden. These will include the Minneapolis, the Henderson, and the Flanders, while the Pope will also make its first appearance at a show. The Minneapolis is well known in the West, but the Henderson and the Flanders are both new. The Henderson is a four-cylinder mount with a number of features that are decidedly interesting. The Flanders and the Pope are both single-cylinder machines.

The accessory departments will be noteworthy from the fact that there is a tendency on the part of the exhibitors to show what may be useful or serviceable for equipment or supplies, while the number of part makers exhibiting is seemingly decreasing each year. There will be a total of 317 displays in this division and in addition to this eight publications will be represented.

Taken all in all the show will have no less than 436 separate and distinct exhibitors, which can be summarized as follows:

Pleasure cars	60
Power wagons	32
Motorcycles	16
Publications	11
Accessories	317
	436

The Madison Square Garden show will be opened the evening of January 6 at 7 o'clock. The pleasure car division will be concluded the evening of January 13. The power wagon part is expected to be opened at 11 o'clock the morning of January 15 and will continue until 11 the evening of January 20.

The Grand Central Palace show will be opened the evening of January 10 at 7 o'clock. This display will be under the auspices of the National Association of Automobile Manufacturers and the management of Samuel A. Miles. Mr. Miles has for a decade conducted the exhibitions of this organization at Chicago and he is regarded as one of the most experienced and capable executives in the country. The show will be the first to be held in the Grand Central Palace and there is an area of about 120,000 square feet which will insure abundant space for the exhibits and the visitors. With the organization controlled by Mr. Miles, the fine, new exhibition building, and the large number of exhibitors this show is certain to be attractive from every viewpoint.

At this show both pleasure cars and power wagons will be shown, there being 33 different makes of the former classification and 35 of the second. A considerable number of both types of machines will be seen at New York for the first time. Much interest is attached to some, they being highly developed and perfected vehicles, and the creations of men of well known reputation as engineers. These cars and wagons will undoubtedly attract many to this show, and the combination of the two, being shown at the same time as the Madison Square Garden exhibition, ought to be given an attention by all interested in automobiles who will visit the metropolis. The latest list of accessory exhibitors totals 46, to which should be added eight publications. The summary of the show follows:

Pleasure cars	33
Power wagons	35
Accessories	46
Publications	8
	122

The two shows combined will have 558 exhibitors.

The Importers' Automobile Salon will this season be at the grand ball room of the Hotel Astor, and will be opened January 2. At this there will be 17 different makes of machines shown. These will include the Napier and Daimler cars from England; Itala, Isotta, Lancia and S. P. A. cars from Italy; the Metallurgique and Minerva cars from Belgium; Benz, Mercedes and Opel cars from Germany; Renault, Panhard, De Dion-Bouton, Darracq and C. G. V. cars from France, and the Pic-Pic car from Switzerland. One of the features of the exhibition will be the showing of specially designed bodies.

The show at Chicago will be under the auspices of the National Association of Automobile Manufacturers and the management of Samuel A. Miles. It will be in the Coliseum and the First Regiment Armory and, as the Madison Square Garden show, will be for two weeks. The first week, beginning January 27, will be devoted to pleasure vehicles, and the second, beginning February 5, to power wagons. Both buildings will be utilized both weeks. This will be the largest of the series of shows in that it will have 96 different makes of pleasure machines, while there will be seen 187 exhibits of accessories. This will include seven publications. The second week there will be shown 71 different makes of power wagons and 17 makes of motorcycles, 111 different exhibits of accessories and parts, and 11 publications. The total showing of pleasure cars, power wagons and motorcycles for Chicago will be 184, while at New York the total for both shows will be 176.

It is expected that the shows will be largely patronized and that the results will be more gratifying than ever before, especially from the power wagon exhibitions.

KNIGHT ENGINES FOR ATLAS CARS.

The Atlas Motor Car Company, Springfield, Mass., has adopted a Knight sleeve-valve silent engine for a new type of touring car that it is to place in the market. The engine will be the product of the Atlas Engine Company, Indianapolis, Ind., which has license to build under the Knight patents. The Atlas company will continue to build and use the Atlas two-cycle motor it has used for several years.

Ernest Coler, for a long period in charge of the publicity of the Maxwell-Briscoe Motor Company, and later supervisor of similar work for the United States Motor Company, will conclude his services in that capacity to undertake similar duties with the Willys-Overland Company at Toledo, O.

DEMAND FOR ENGINE-STARTING DEVICES.

Attention Directed Toward Development and Perfection of Practical and Economical Appliances.

The demand for an engine-starting device as standard pleasure car equipment has directed the attention of inventors very generally toward the development and perfection of installations that will be practical and economical. The number of concerns that have self-starters ready for or already in the market is surprisingly large, there being no less than 50 that are regarded as marketable. How many others there may be is uncertain, but this is a sufficient indication that for the coming year there will be at least a sufficient supply to meet all reasonable demands.

The types are numerous as well, these including those operated by hand levers, by foot pedals, by springs, by switches and by press buttons, utilizing electricity, acetylene gas, mixtures of gasoline and air, and compressed air. The systems vary decidedly, some of them requiring tanks and piping to serve each cylinder, while others are remarkably simple and light.

The utilization of these starting devices makes it possible for the driver to escape the labor of cranking a motor, and in this respect cars that are now too large for a woman to start will become as easy to start as an electric vehicle. Most of these starters are comparatively light in weight and no installation detracts from the appearance of a car. Practically all are concealed and add but little to the attention that is necessary.

It can be said that practically every starter has been developed with a view of adding it to any existing car, and that with one or two exceptions installations may be made at small expense for the actual labor.

Many of the manufacturers of cars, in fact about 60 in all, have thus far equipped their 1912 machines with starters, and it is probable that within a short time this number will be considerably increased. Some manufacturers are offering the starters as optional equipment. Others make a charge of the installation included in the price of the cars. The cars, however, range from moderate to high prices, the installation being by no means an indication of cost.

As an auxiliary or accessory to cars already existing the market for such devices is seemingly unlimited. There is a very great number of cars in use—probably half a million—and to a large proportion of these starters may be added. This is a market that can be exploited with a certainty of returns, and which is open to all those engaged in any business that will bring them in contact with the motorists. It should be understood that it is not necessary as a rule to have special facilities to make such installations, and ordinarily intelligent mechanics can undertake such work with satisfactory results.

To what extent starters will be demanded upon service vehicles is uncertain. It is a fact, however, that some of the manufacturers will include them as regular equipment, this auxiliary being regarded as necessary to facilitate service and more nearly continous operation.

COL. J. H. SPRAGUE DEAD.

Col. James H. Sprague, who was one of the best known manufacturers in the industries allied to motor vehicle production, died recently at Norwalk, O., after a lengthy illness. He was president of the Sprague Umbrella Company and manufactured tops, covers and windshields. He was a soldier in the civil war and was one of the most enthusiastic of veterans.

INDUSTRIAL ACTIVITIES IN INDIANA.

Summarized Facts Concerning the Manufacturers and Distributors of Power Vehicles and Equipment.

Application has been made in the Marion county superior court at Indianapolis, by Harold S. Block, Wheeling, W. Va., a stockholder, for the appointment of a receiver for the Mais Motor Truck Company on the ground of insolvency. The allegation is made the company owes $144,000 and that its operations should be under court control. President Will H. Brown maintains that the company's assets exceed its liabilities by $130,000, that its business is good and that the proceeding was actuated through pique by a small stockholder. The court authorized the completion of six trucks.

The Premier Motor Manufacturing Company, Indianapolis, has produced a two-ton power wagon which is to be built as stock. The motor is a four-cylinder type. The construction differs entirely with the Premier pleasure machines. The wagon has pneumatic tire equipment and is to be furnished with any type of body.

Want Every Manufacturer Represented.

The Indianapolis Trade Association and the Hoosier Motor Club is endeavoring to induce every Indiana motor vehicle builder, not already represented, to establish an office or a salesroom with service station in that city.

John W. Hayden, who resigned as general manager for the United Motors Indianapolis Company because of ill health, has been succeeded by Thomas Marshall of Detroit.

A. F. Mais, who resigned as chief engineer of the Mais Motor Truck Company, has become consulting engineer of the Studebaker Corporation and is attached to the Detroit experimental division of that concern.

The shows made in the salesrooms of the members of the Indianapolis Automobile Trade Association of the latest models of cars was entirely successful and was productive of considerable business.

Empire to Move to Detroit.

According to Carl G. Fisher the Empire Motor Car Company will be removed from Indianapolis to Detroit.

On petition of Theodore M. Weiss, a stockholder, representing that the Star Motor Car Company, Indianapolis, was insolvent, George Lehnert has been appointed receiver of that concern. The company was organized a year ago and has built but one car.

New buildings are to be erected at Anderson to manufacture the Peters electric headlight for locomotives, the business of the R. G. Peters Company having been purchased by the Remy Electric Company and that division removed to Anderson.

According to announcement 2500 Overland cars will be built at the Indianapolis plant of the company for the 1912 season.

New Amplex Car Coming.

The Simplex Motor Car Company, Mishawaka, has completed designs for the production of a 40 horsepower car with a five-passenger body which is to be known as the Baby Amplex. It will have a four-cylinder two-cycle motor. Plans are making for the enlarging of the plant for the production of 1000 of these cars annually, as well as 300 of the standard Amplex types.

With capital of $10,000 the Studebaker Corporation of America has received authority to do business in this state. The company is capitalized for $100,000 in New Jersey and represents the $45,000,000 Studebaker concern, which has a big plant at South Bend.

Will Make Starting Equipment.

A factory at 427 North Meridian street, Indianapolis, is being equipped for the Motor Starting Company to manufacture self-starting equipment for motor vehicles. L. W. Cooper is president of the company. The invention is to install an auxiliary fuel supply to a small carburetor located in the floor of the car near the driver, and to pipe each cylinder so that by means of a hand pump gas is furnished each cylinder, in sufficient volume and compression to fire from the spark generated. The company has been incorporated for $1,000,000 under Delaware laws.

With capital of $10,000 the Antidam Manufacturing Company has been incorporated at Indianapolis by R. P. Irwin, J. M. Irwin and George Bott, and has engaged in the manufacture of a heat retaining radiator cover. George Bott is secretary, treasurer and general manager of the company.

Will Build Pleasure and Service Vehicles.

The American Automobile Manufacturing Company, New Albany, of which George H. Wilson of Louisville, Ky., is now president, will begin to produce cars the first of the year. The purpose of the company is to build a complete line of pleasure cars and light and heavy power wagons for service. These will have Jonz two-cycle and Jonz four-cycle water-cooled motors.

The Warner Gear Company, Muncie, has secured the manufacturing rights for the United States for the Lanchester worm gear drive system from English patent owners and will manufacture the drives and differentials, not the complete axles.

The Empire Gear and Manufacturing Company has been organized at Indianapolis with capital of $20,000, which may be increased to $250,000 if conditions justify, with Frank S. Clark as president, Charles N. Hurd vice president, Howard M. Talbot secretary, Albert H. Off treasurer, and Wesley Haufler general superintendent. The company will begin the production of motors and transmissions the first of the year.

The Fisher-Gibson Company entertained more than 75 Indiana Overland agents at Indianapolis Dec. 12. John N. Willys, president of the Willys-Overland Company, and several officers of that company were included among the guests.

DEATH OF PROF. WARREN S. JOHNSON.

Following an illness of more than two years Prof. Warren S. Johnson, president and treasurer of the Johnson Service Company, Milwaukee, Wis., died Dec. 5 at Los Angeles, Cal. Prof. Johnson was noted as an inventor and engineer. His company is the largest maker of thermostats and scientific heating apparatus and pneumatic clocks in the world, and has been engaged for years in the manufacture of pleasure cars and service wagons. Prof. Johnson was the first to advocate and promote the use of automobile vehicles in postal service.

WILL MANUFACTURE SPARK PLUGS.

The Hartford Machine Screw Company, Hartford, Conn., which has for years made the metal parts for spark plugs for other manufacturers, is about to engage in the manufacture of what will be known to the trade as the H. M. C. spark plug, and later this will be followed by another at a cheaper price. It is stated that the quality will be high and the prices such as will command attention.

Two trucks have been built by the New Britain Machine Company, New Britain, Conn., to specifications that closely follow those of a well known English machine. The trucks were to a special order.

WITH THE MICHIGAN INDUSTRIES.

Activities of the Automobile and Allied Interests Throughout the Wolverine State.

W. E. Metzger, president of the Metzger Motor Car Company, Detroit, has named as his assistant C. F. Garaghty, who was recently assistant treasurer of the E-M-F Company.

The capital of the Hildreth Manufacturing Company, Lansing, has been increased from $75,000 to $112,500. This concern produces gasoline motors and air pumps.

The new testing shed for the Hudson Motor Car Company, Detroit, which is now building by the A. J. Smith Construction Company, is to be two stories and 500 by 50 feet.

General Manager Mead of the Olds Motor Works, Lansing, has appointed as his assistant O. G. Baker, an automobile engineer of considerable experience.

The Jackson Automobile Company, Jackson, has developed a new body type, this being a coupe which is installed on chassis of 118 inches wheelbase and fitted with 34-inch wheels and tires. The car is left side control with levers in the centre. The vehicle is lighted entirely by electricity.

Electric power wagons of differing capacities are to be produced by the Hupp Corporation, Detroit, and in addition there has been announcement of the building of bodies of varying sizes and elegance for equipment of the Hupp-Yeats chassis, which is already a well known standard car. These bodies will, it is stated, exceed anything the company has yet produced as stock creation in every detail of construction, upholstery and finish.

Regal to Make Delivery Wagons.

The Regal Motor Car Company, Detroit, has begun the manufacture of light open and enclosed express bodies which it is installing on chassis similar to those for pleasure car bodies. These vehicles are intended for fast commercial service and are not for carrying heavy loads.

The steering gear product of the Lavigne Gear Company, which has absorbed the Lavigne Steering Gear Company of Detroit, will be manufactured at Corliss, Wis., near Milwaukee, which will relieve the plant of the Lavigne Manufacturing Company for other products.

The Chevrolet Motor Company, Detroit, has the following organization: President, William H. Little, Flint, Mich.; vice president and treasurer, Dr. E. R. Campbell, Detroit; secretary, Curtis R. Hathaway, Detroit; designer and consulting engineer, Louis Chevrolet, Detroit; assistant secretary and treasurer, W. W. Murphy, Detroit. The concern is to build the Chevrolet six-cylinder car. The company has increased its capital from $100,000 to $2,500,000 to insure adequate facilities, it is stated.

Doubles Factory Capacity.

Knell & Adams, body finishers, Detroit, has acquired the property of Burnham, Stoepel & Co., at 1039-43 Jefferson avenue, which includes a two-story factory that is to be remodelled, affording an increase of about 100 per cent. production. The company will continue the use of the old factory at 1020-30 Beaufeit street.

D. W. Connell, widely known in the West through association with vehicle trade, is now associated with the Oakland Motor Car Company, Pontiac.

Included among the new Detroit corporations are the Security Motor Switch Company with capital of $10,000, and the Simpson Fiber Tire Company with capital of $100,000.

Grover C. Farnsworth, well known as a writer, has been placed in charge of the advertising and publicity department of the Briggs-Detroiter Company, which is soon to place in the market a small runabout. Mr. Farnsworth is a graduate of the engineering department of the University of Michigan.

New Hupp Factory Contracted For.

E. P. Decker & Co. has been awarded contract to erect the new buildings for the Hupp Motor Car Company at Milwaukee and Mount Elliott avenues, Detroit.

The Ignition Starter Company has removed to Detroit from Grand Rapids and will increase its production from 200 to 400 starters a day. J. W. Fitzgerald is president and designer of the concern which makes the Disco starter.

Will Remove Plant to Detroit.

The Hoskins Manufacturing Company, Detroit, has purchased the business and equipment of the International Electric Motor Company, Chicago, Ill., and has removed it to Detroit, where the production of electrical specialties will be continued.

The Detroit branch of the Bosch Magneto Company is located at 1250-2 Woodward avenue and it includes an office, salesroom, repair shop and laboratory and garage, all with adequate facilities.

Receiver for New Dyke Company.

The Security Trust Company is receiver for the Van Dyke Motor Car Company, Detroit, which, after first being an involuntary respondent to bankruptcy proceedings instituted by three creditors, filed a voluntary petition in bankruptcy. The liabilities were stated as $143,090.02, and the assets as $90,329.85, the latter including bills receivable and other securities and machinery, tools and equipment. Lack of capital has been the cause of the company's embarrassment. It is expected that the business will be disposed of and that possibly reorganization will take place.

Additions with about 30,000 square feet of floor space have been made to the plant of the Abbott Motor Company, Detroit, including a two-story structure devoted to final assembly, and liberal increases of area for chassis assembling and the office force. Fire protection has been improved by installation of a sprinkler system and a large supply tank.

Ford Production Doubled.

The production of the Ford Motor Company, Detroit, is claimed as being 100 per cent. more for November than it was for the corresponding month of last year, about 4000 cars having been shipped during the period.

The Imperial Automobile Company, Jackson, has appointed A. J. Rousseau, formerly with the General Motors Company, as sales manager of its western district.

A branch establishment has been created at Hamburg, Germany, by the Ford Motor Company.

The Republic Rubber Company of Michigan has been organized and will distribute Republic tires and tubes in the state. The Detroit office and salesrooms are at 1001 Woodward avenue.

K-R-I-T Cars Shipped Abroad.

The K-R-I-T Motor Car Company has recently shipped 73 cars to foreign countries, of which 50 went to Great Britain.

L. J. Fasquelle is now general sales manager of the General Motors Company, and has charge of the distribution of the Rapid and Reliance trucks, while the service department is directed by T. P. Myers, formerly sales manager of the Rapid company.

Walter E. Flanders has become president of the Flanders Manufacturing Company, Pontiac, succeeding Robert M. Brownson, and having associated with him the following officers: Vice president, A. O. Smith, Milwaukee, Wis.; secretary-treasurer, H. L. Stanton; assistant secretary-treasurer, James B. Book, Jr.; general manager, Don C. McCord. George W. Sherman has retired as sales manager for the company.

RESULTS OF 1911 RACING SEASON.

WHO'S WHO IN THE INDUSTRY.

R. P. HENDERSON.

R. P. Henderson, Vice President Henderson Motor Sales Company.

R. P. Henderson, vice president of the Henderson Motor Sales Company, Indianapolis, Ind., which concern is general distributor of Cole cars, is one of the executives whose identity has but recently been established with the automobile industry, although he was for a considerable period actively interested in the Henderson company before he decided to devote himself entirely to its service.

Mr. Henderson is a brother of C. P. Henderson, organizer of the company, and for five years was sales manager for the Parry Buggy Company of Indianapolis. He formed a very wide acquaintanceship throughout the country and has a broad knowledge of service conditions which is now especially valuable to him. The prospects for business development were such as to attract Mr. Henderson to become associated with his brother and since he joined the company he has devoted himself toward broadening the channels for the marketing of Cole cars with material success.

JOHN S. AND D. A. HARRINGTON, JR.

The firm of J. S. Harrington & Co., agent for the Everitt cars with salesrooms in Boston, Worcester and Providence, and distributor for the line in New England, is now disposing of what is regarded as the largest order for automobiles ever given by a New England firm. A reservation of 1000 four and six-cylinder machines was made by the Metzger Motor Car Company for Harrington & Co., after a visit to Detroit early last summer by John S. Harrington, head of the concern. Then followed plans for marketing this order.

John S. and Daniel A. Harrington, Jr., of the Firm of J. S. Harrington & Co., Distributor of Everitt Cars.

John S. Harrington is one of the oldest as well as one of the best known motorists in Worcester. It was in that city he first engaged in business and later on he established a branch at Providence. Then came the opening of the Boston salesrooms. Daniel A. Harrington, Jr., brother of John S., was first located at Providence as manager of that branch, but he now gives all of his time and attention to the Boston business. He is quite as well known as the executive of the company. The brothers are exceedingly enterprising and have been successful with all lines of machines they have marketed.

Incidentally Mrs. John S. Harrington is a driver of unusual skill and judgment and she has driven in contests on Dead Horse hill at Worcester, a course that is known to all motorists, making time that was decidedly favorable when compared with the records made by men in cars of similar capacity.

F. R. BUMP.

F. R. Bump, Assistant General Manager of the Hupp Corporation.

One of the veterans of the motor vehicle industry, who has been identified with it since its inception, and previous to that with the production and sale of the bicycle, is F. R. Bump, who has recently been made assistant general manager of the Hupp Corporation, Detroit, Mich., which organization builds the R. C. H. cars, the Hupp-Yeats electric vehicles and various components utilized in automobile construction. He has charge of the sales, advertising and publicity of the concern.

Mr. Bump retired as sales manager for the Universal Motor Truck Company, Detroit, Mich., to assume his present engagement. When he was graduated from Cornell University in 1896 he became assistant to the sales manager of the Waltham Manufacturing Company, Waltham, Mass., then producing Orient bicycles. He resigned to become general manager of the bicycle department of the Davis Sewing Machine Company, maker of Dayton bicycles, which position he held until 1904, when he went to the H. H. Franklin Manufacturing Company, Syracuse, N. Y., maker of Franklin cars, as general sales manager. He retired from this position in 1910 and after several car agency connections joined the Universal Motor Truck Company. He is one of the best known men in the industry and his experience has been especially varied and valuable.

ALBERT H. DOOLITTLE.

The value of thorough mechanical knowledge in publicity promotion is demonstrated by the success of Albert H. Doolittle, advertising manager of the Knox Automobile Company, Springfield, Mass., who has been connected with several of the largest firms in the industry. Mr. Doolittle was graduated from the

WHO'S WHO IN THE INDUSTRY.

engineering department of Cornell University in 1904 and in 1905 went to the engineering staff of the Pope Manufacturing Company, Hartford, Conn. The following year he entered the employ of the Electric Vehicle Company, Hartford, and there had experience in every mechanical department, and then took up contest driving and later was engaged in selling Columbia cars. He continued with the Columbia Motor Car Company when that succeeded the Electric Vehicle Company, and became assistant manager of the branch in New York, N. Y. Mr. Doolittle made a six months' motor tour of Europe in 1909, during which he travelled more than 7000 miles and visited many of the prominent motor car factories and carefully studied work and methods. In the course of his touring he drove an American car over 15 of the highest passes of the Alps. He entered the employ of the Knox Automobile Company at his return and after gaining a thorough knowledge of the Knox mechanical construction and having other experience he was appointed publicity writer and assistant advertising manager. He was made advertising manager later on and now directs the campaign that the Knox company is so actively promoting with decided success. Mr. Doolittle is very widely and favorably known to the industry and to a large number of motorists.

Albert H. Doolittle, Advertising Manager, the Knox Automobile Company.

William T. Kincaid, Manager Kincaid Oil Company, Providence, R. I.

Robert C. Hupp, Creator and Executive of the Enterprises Known as the Hupp Interests.

WILLIAM T. KINCAID.

With those who have been active in the promotion of the use of the automobile vehicle there is none better, and few as well, known as William T. Kincaid, president and manager of the Kincaid Oil Company, Providence, R. I. He has for years been engaged in the distribution of lubricants and during a considerable portion of the time directed and supervised the use of the products he sold by racing men and in racing machines. This work brought him in contact with every driver of prominence and his experience with differing forms of oils and greases under all conditions of severe service, and often hardest stress of track and road contest, has probably not been equalled by any other man. This has been exceedingly valuable to him in business and has given him prestige that is not often enjoyed by those even most active in the industry. He is recognized as an authority on racing subjects and managed the beach racing meet at Old Orchard, Me., last September, this being so successful that it is probable it will become an established fixture of the East. Genial and affable, with a friendship that is world-wide, and energetic and resourceful in business dealing, Mr. Kincaid is a prominent figure in motordom generally and in his own industry especially.

ROBERT C. HUPP.

As an example of what success may be accomplished by energy, confidence and the ability to convince others of the worth of a project is the business career of Robert C. Hupp of Detroit, Mich., who is executive of the group of enterprises known to the automobile industry as the Hupp interests. These include the Hupp Corporation, the Hupp-Yeats Company and the manufacture of components entering into the construction of a motor car. While he was identified with the motor vehicle industry for a considerable period it was not until 1908 that Mr. Hupp became known as a manufacturer, and in a comparatively short time his business connections have become extremely large and important.

Mr. Hupp has been exceedingly fortunate in his projects, this applying equally well to planning, organizing and executing, and he has selected his lines of endeavor with astute knowledge of the requirements of the people and the markets. It is seldom that so young a man as Mr. Hupp gains the confidence and support of men of large affairs and it is rare that one makes so uniform successes as he has. Every undertaking he has engaged in has been demonstrated to be well founded from every angle and it will be admitted that he has had to meet with exactly the same conditions as have others who have not succeeded.

Mr. Hupp has been ambitious in his plans and while it may be said that he has accomplished much more in a comparatively brief period than many have in a life time, it is maintained for him that he has but little more than entered upon the threshold of his ambitions. With confidence in himself born of experience and inspiring the material support of others because of his successes, it would appear that Mr. Hupp's prospects are unusually brilliant.

THE ACCESSORY —AND— GARAGE JOURNAL
Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. I. NO. 2.

AUTOMOBILE JOURNAL PUBLISHING CO.
Times Building, Pawtucket, R. I.
Publisher of

PUBLISHED THE 15TH OF EACH MONTH.

SUBSCRIPTIONS:
The United States and Mexico, the year, $1 in advance; Canada and Foreign Countries in Postal Union, the year, $2 in advance. Fifteen cents the copy.

CONTRIBUTIONS:
Anonymous communications not considered. Correspondence on subjects relating to the motor industry and the trade will receive attention. Stamps must be enclosed to insure return of unsolicited contributions.

ADVERTISING:
Information supplied at request.
Advertising Copy for the ACCESSORY and GARAGE JOURNAL requiring submission of proof must be received by 5th of month to insure publication in issue of the 15th of month.
Advertising Copy, proof not required, accepted to morning of the day before publishing day (unless such day is Sunday or holiday, when previous day is limit) of each publication.
Remittances should be made by Check, Draft, Postoffice or Express Money Order, or Registered Letter. Money enclosures must be at sender's risk.

SEASONABLE STOCKS.

With practically every dealer in motoring accessories and supplies a portion of the stock carried consists of articles or goods that are in demand with reference to the seasons, a condition which calls for the exercise of more than ordinary care in buying. The enterprising man assumes that it is necessary to have whatever is desired, a very wise conclusion were it not for the fact that capital is often limited and to meet every requirement would necessitate investment that would materially lessen profits and often result in loss if one were to await demand. It is possible to obtain whatever is sought, with rare exceptions, in comparatively brief time and it is much better to do business by special order and quick delivery, insuring absolutely new goods, than it is to take chances with a stock for which there is a limited and uncertain sale.

DEMONSTRATING THE SPECIALTY.

Every business man has brought to his attention frequently articles that may be a necessity or a convenience, the value of which may not always be apparent to those who give but casual attention. This is especially noticeable with motor vehicle accessories. Whatever is offered for sale ought to be understood by those selling it, and when anything new is placed in the market the duty of the salesman distributing it, and those buying and selling it, is to learn the qualities claimed by the manufacturer with a view of demonstration to all who may be interested. Interest may often be created by a suggestion, a brief statement of fact, and by an illustration of the possibilities the foundation of considerable business may be established. The results are always dependent upon the knowledge of the salesman and his ability to convince the customer.

NEED OF PRECISE INFORMATION.

Any manufacturer of an article that is intended to be adapted to general use ought to make perfectly clear to the distributors, by information that may be filed, or by full note in catalogue, the conditions necessary for installation, or where installation may be made without change or special fitting. This is essential that the prospective purchasers may learn any fact that may be necessary. The general tendency is to deal with generalities in advertising matter or in catalogues, which causes confusion and often no end of trouble for the salesmen. In marketing a product of the class referred to it would be well to supply every detail and not leave anything to assumption or to the assumed intelligence of the purchaser.

SELLING THE AUTOMOBILE.

No rule can be established for the salesman who is displaying the motor car to a customer, for each person's requirements may differ with another, but it is certain enough that the seller's knowledge of the machine ought to be such that he can discuss mechanics with the mechanic, tell the same story in non-technical language to those who are not mechanically versed, and illustrate arguments with logical statements that do not make comparisons with other machines. The man who invites competition with what he has to sell will probably inspire confidence, while he who avoids contrast with others does not improve his case. He may bring about just what he seeks to escape by exaggeration or ridiculous comment, and should these be repeated and resented a business warfare may be precipitated that cannot result in good and may be much regretted.

BENEFITS FROM THE SHOWS.

Much that will benefit the man who conducts a garage or manages a store can be gained by visiting one or more good exhibitions. The larger and the more complete the better the results, if one is disposed to make the occasion one of business rather than pleasure. The garage manager can devote himself to perfecting his knowledge of cars in general, and of some special machines he may not be perfectly familiar with, because it is desirable to know of the changes made in construction that work on such machines may be intelligently directed. If cars are sold there is need of learning of all makes that are in the same classifications, while so much time as may be desired may be given over to the accessories. Incidentally the manufacturers and their representatives may learn much from careful and systematic visits to the exhibits, while those engaged in designing and construction can profit materially by examination of the displays.

MECHANICAL POINTERS for GARAGEMEN AND OWNERS

HACKSAW ATTACHMENT FOR LATHES.

The lathe is a useful article of equipment in the small motor car repair shop or private garage and is practically a machine shop in itself, as all turning operations and many milling, grinding and boring jobs can be accomplished with its aid. The accompanying illustration, Fig. 1, shows a simple power hacksaw attachment that can be used in connection with this versatile machine tool, and its utility in the small shop where such a device does not form part of the regular equipment can be readily understood.

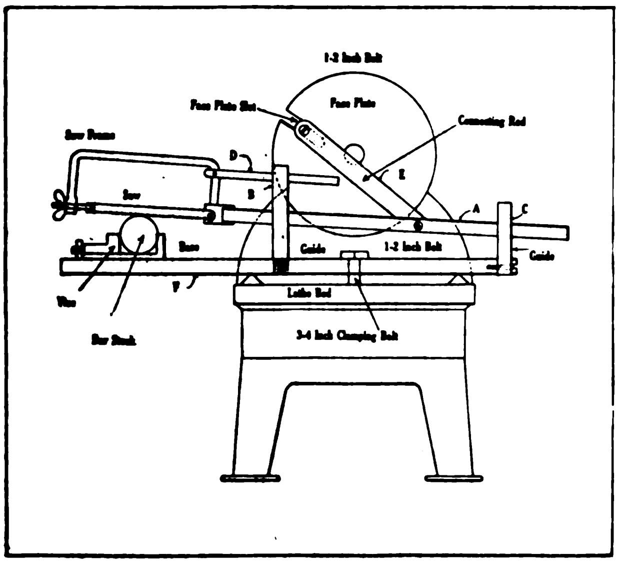

Fig. 1—Simple Power Hacksaw Attachment for Lathes.

The attachment consists of the slide bar A, to which the hacksaw frame is attached, and the guide bars or supports B and C that are firmly attached to the base piece F. The bar A is worked back and forth by a connecting rod E, that is adapted to be attached to the face plate of the lathe. The small bar D is a guide piece to keep the saw frame from turning.

The device is simple to build and the materials entering into its construction are not costly; in fact the design is such that it may be easily placed on or detached from the shears of the lathe. The base plate F is composed of a cast iron slab one inch thick, eight inches wide, and about five feet long. It is possible to form the guide members B and C integral when the slab is cast if they are placed on the pattern. The slide is a flat piece of steel ⅝ inch thick and two inches wide, the length is about four feet, though this will vary according to the stroke.

A hole is drilled in the centre of the bar for a ½ inch bolt, which is to form the crankpin for the lower end of the connecting rod E. The supports B and C may be made of one inch square machinery steel. The support B has an end turned and threaded to suit a ¾ inch tapped hole made in the cast iron base F. The support C may be attached in a similar manner or bolted to the other end of the base as shown. Each support has a ⅝ inch slot cut through the centre, this being made just large enough to permit an easy sliding fit to exist between the slide bar and the sides of the guide members.

The smaller guide D is made of ⅝ inch by one inch machinery steel, one end being bolted or rivetted to the saw frame, allowing the other end to slide through the support B, thus eliminating any tendency of the saw frame to wabble. The connecting rod E is a strip of ⅝ steel about two inches wide and of a length to suit that of the saw frame, which obviously determines the permissible stroke. The connecting rod is drilled at both ends for ½ inch bolts, and is intended to be attached to the face plate of the lathe at the upper end and the slide bar A at the lower end. The upper end may be moved to some extent in the slot of the face plate, making it possible to vary the stroke within the limits allowed by the slot and the size of the attachment. The saw frame is forged of machinery steel and the blade is made tight in the usual manner, by a thumb screw at the outer end of the frame. An ordinary drill or shaper vise is clamped to the base plate, this to hold the stock that is to be cut off. The attachment is bolted to the shears of the lathe by a clamping bar under them, which is pressed into engagement by a ¾ inch bolt as depicted.

VALVE TIMING.

In engines having the valves on opposite sides and fitted with a double ignition system, the spark plugs for the emergency ignition group are often placed on the exhaust side. It is sometimes found that the emergency system will not fire the motor regularly nor is the engine so powerful as when the magneto current, operating through the spark plugs over the inlet valves is employed. It is generally found that better results can be obtained from the spare ignition plugs if the hole through the valve cap in which the plug is screwed is enlarged. If the sparking plug points are set in a deep pocket, such as shown at Fig. 2 A, the hot exhaust gases are confined close to them, and may cause carbon deposits on the insulator or between the points that will make the plug inoperative. When the hole is enlarged as shown at B, there is more room for the gases which are not concentrated against the spark plug points.

The failure to start the engine on the switch sometimes experienced with a spare coil ignition system is very often due to the same condition, for there is practically no compression when the engine is at rest and the mixture will not approach the sparking points sufficiently to become ignited if they are enclosed in a pocket as at A. This applies to both sides of the motor. When the plug points are closely adjacent to

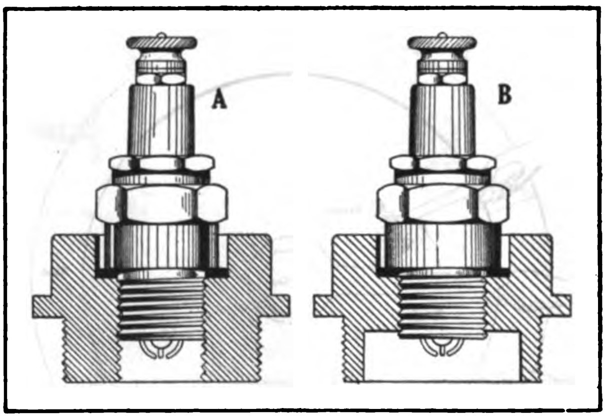

Fig. 2—Proper Method of Installing Spark Plugs in Valve Caps.

the combustion space, the explosion tends to burn away any deposit that may have formed on them, if over the exhaust, while they are more easily reached by the incoming fresh charge of gas if the inlet valve cap is cupped out as indicated at B.

LEFT HAND THREAD CUTTING.

Occasionally the repair man is called upon to cut left hand threads on brake, radius and other rods. This may be accomplished without the aid of a screw cutting machine or left handed dies. At Fig. 3 is shown a method of utilizing a right handed tap for this purpose, one of the desired number of threads being run into a nut until a snug fit is secured. The tool is then removed and a V slot cut of such a depth that when it is replaced, one cutting edge will be just above the bottom of the groove. It is then turned upside down after being inserted in this holder and with a piece of copper placed in the vise as shown. The soft metal is essential as otherwise the thread may be spoiled by pressure in the operation. The rod to be cut is then placed as outlined and turned to the left.

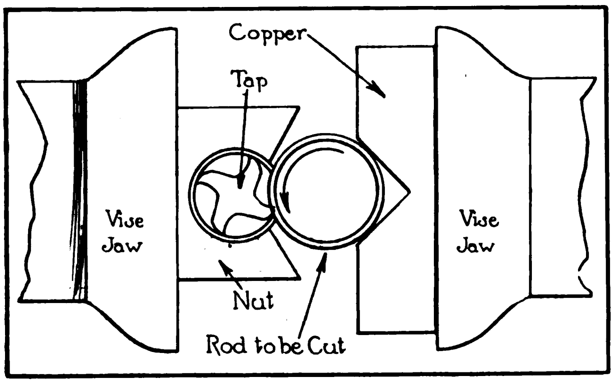

Fig. 3—Cutting a Left Hand Thread with a Right Hand Tap.

REMOVING STUBBORN HUB CAPS.

In inspecting the bearings of motor car wheels, or removing them from the axles it is necessary to remove the hub caps and while special wrenches are provided for this purpose by most manufacturers, and included in the tool equipment, the caps are sometimes very hard to displace. There are a number of conditions that cause this. On some types of floating axles the hub caps are depended upon to keep the driving shaft clutches in contact with the hubs, and as there is some strain and the caps are liable to loosen, a fine thread is used and the cap is set up very tightly when first assembled. Then again, paint sometimes gets in the threads, and when careless assembling methods prevail, the hub caps are often forced on over a rusty or wet thread, and thus become tightly bound. When bronze caps are used, they are not so liable to stick because of rust, but pressed steel members are very likely to "freeze" in place because of rust deposits in the threads.

While the wrenches provided have ample leverage, it is sometimes difficult to free the hub cap sufficiently to start it from the position where it has set. In watching workmen remove these caps, the writer has found that various methods were the vogue, some of which could be commended, and others which were not so desirable. A very common process is to employ a heavy hammer as shown at Fig. 4 A, the operator holding and bearing down upon the end of the wrench with one hand and striking it at a point near the end with the hammer as indicated. If the hub cap is not too tightly rusted, it will be loosened by the hammer blow, which has a tendency to break the film or layer of rust holding the hub and cap together.

The hammer, however, is not a tool that is highly esteemed by the thorough mechanic, except for its legitimate uses and as the wrench is mutilated, and the operator is liable to injure his hand if the hammer should slip, the experienced man believes that there are methods better suited from a viewpoint of mechanical fitness. A simple process is shown at Fig. 4 B, this involving the use of an ordinary lifting jack. The wheel, if a rear one, is firmly locked by a brake, if a front one by suitable blocking to prevent it turning, and the wrench is applied as indicated. The jack is placed under the free end, and as a pressure of tons can be brought to bear upon the hub cap in this manner, it is seldom that one cannot start the most stubborn member by this method.

The last resource of the mechanic when other means fail is to heat the hub cap thoroughly with a gasoline torch, taking care not to blister the paint of the wheel, and after it has been heated to some extent, and presumably expanded, to see if one can inject some kerosene between the threads with an oil can or syringe. With a lead or copper hammer, the hub cap is carefully tapped all around to break the rust bond, and if the wrench is applied before the hub cap has a chance to cool too much, it should not be hard to remove it. It is often preferable to blister a little paint than be forced to remove a specially stubborn fitting with a cold chisel and hammer.

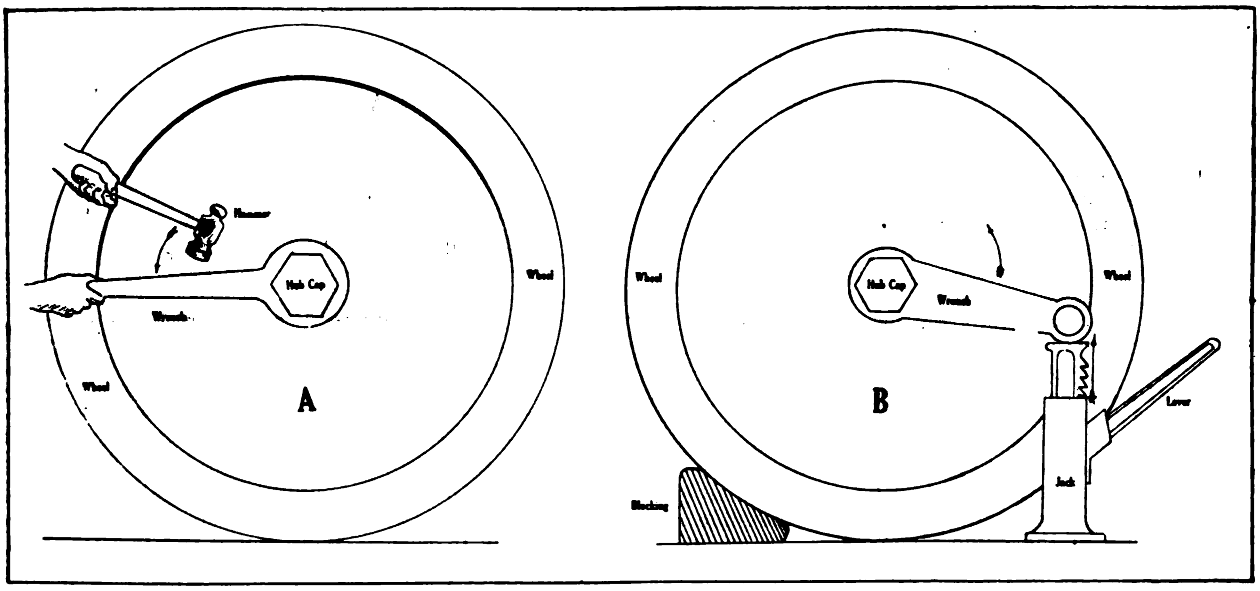

Fig. 4—Outlining Several Methods of Removing Hub Caps That Have Become Rusted in Place.

HINTS ON USING MICROMETER.

The correct setting and reading of the micrometer is little understood by many workmen. Callipers should not be employed when accurate measurements are to be made, as these cannot be obtained with this instrument. The first named is a valuable asset in the shop. It should be handled tenderly and not subjected to rough usage, for unless cared for it will soon cease to be a tool of precision.

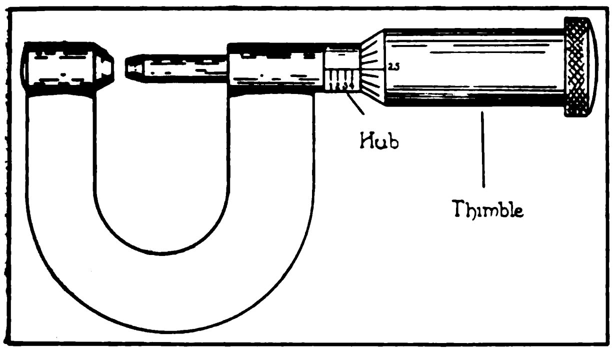

Fig. 5—Outlining Use of Micrometer.

When turning a spindle, if it is desired to measure the diameter, the micrometer should not be forced over, but the screw should be eased back, thus bringing the contact points clear of the metal. By turning screw until the points just touch the object, the measurements can be read off easily. It should never be used to measure a member while in motion.

Some are fitted with a ratchet stop, so arranged that when the points of the tool come in contact with the shaft it is brought in operation, thus preventing any undue pressure. This also is very convenient when a number of measurements are to be taken, as it enables the same degree of pressure to be applied to all the articles.

In using the micrometer, it is essential to have decimal equivalents of parts of an inch. Most instruments have these stamped on the surface, but as the figures are very small, it is advisable to hang a table on the wall or procure a copy of pocket size. One was published by The Automobile Journal in the issue of May 13.

At Fig. 5 is shown a micrometer, the working of which can be grasped easily. The pitch of the screw is 40 to the inch, as is the graduation of the hub, and the latter is marked 1, 2, 3, 4, etc., every fourth division. As the graduation of the hub conforms to the pitch of the screw, each division equals the longitudinal distance traversed by the latter in one complete revolution, which opens the micrometer one-fortieth or .025 inch.

The beveled edge of the thimble is graduated into 25 parts, and figured 0, 5, 10, 15, etc. Each, when passing the line of graduation on the hub, indicates that the screw has made one twenty-fifth of a turn, and that the opening of the gauge has increased one-twenty-fifth of one-fortieth, or .001 of an inch.

To read the instrument: The number of divisions visible on the scale of the hub should be multiplied by 25, and to the product should be added the number of divisions on the scale of the thimble from zero to the line coinciding with that of graduation on the hub. For example, the number of divisions seen on the scale of the hub in the sketch is four. By multiplying this by 25 we have 4x25=100.

It will be noticed also that the division number on the scale of the thimble coincident with the line of graduation on the hub is 25. Adding this to the above we get 125. A decimal point is placed in front of this number making it .125. This is expressed as a fraction of an inch that equals one-eighth, as shown by a table of decimal equivalents, and gives the amount by which the gauge is opened.

HOMEMADE BREAST DRILL LATHE.

In drilling holes .015625 or .03125 inch in diameter, the small actual cross section of the twist drill makes it an easy matter to snap it. Then again it is difficult for the amateur repairman to drill the hole accurately as he is apt to make the opening larger than the actual diameter of the drill. In Fig. 6 is shown a design of a homemade breast drill lathe which is capable of doing light work such as drilling, polishing, refacing valves, turning keys to size and numerous other light jobs. The cost of making the device is small and the average motorist can make one.

In Fig. 6 A is shown the breast drill clamped in a vise. By the aid of a spirit level, with which many drills are equipped, a perfectly horizontal position is secured assuring accurate work in drilling. To make the tailshaft member a block of wood, hard is preferable, and a strip of sheet iron .1875 is necessary. The block should be of inch stock, six inches long and

four inches wide. Assuming that from the centre of the chuck of the drill to the top of work bench is 5.5 inches it will be necessary to use a strip of sheet iron at least eight inches long by four inches wide.

A piece of iron or soft steel, two inches long, one inch wide and .25 inch thick, is rivetted to the strip of iron as shown in Fig. 6 C. This plate should be attached so that its centre is 5.5 inches from the top of the bench in order that the tailshaft will line up with the centre of the chuck. Holes, .25 inch in diameter, are bored in the metal strip for the purpose of fastening it to wooden block, as is shown in Fig. 6 C. The metal is then cut and bent to shape.

In making the cut due allowance must be made for the block, which is one inch, and to the centre of the rivetted plate, which is 4.5 inches less .1875 inch, the thickness of the sheet iron. A small variation can be offset when placing breast drill in lathe. The centre of the rivetted plate is prick punched, drilled and tapped for .5-inch thread. By using a spirit level a true vertical position can be secured when fastening the device to the block. Four holes, .4375 inch, are bored as shown in Fig. 6 A, for the purpose of bolting tailshaft member to work bench.

The tailshaft is made of .5-inch round stock about six inches in length. One end is pointed while at the other is fastened a small hand wheel which can be pinned to the shaft. The tailshaft is threaded and can be locked by a nut on either side when using the lathe for turning purposes, as shown in Fig. 6 B. Four holes are now bored through the iron and block to take .375 inch in diameter bolts which are used to fasten the device to the workbench.

Allowance must be made for operating the tailshaft when boring holes to fasten the block to the workbench. The bolts should be long enough to permit of the use of nuts and washers. The device can be fastened either at the right or left hand of the vise, according to convenience. When not in use it can be easily removed.

REPAIRING EXPANDING TYPE BRAKES.

When cars are fitted with the expanding type of brake considerable wear takes place where the cam bears. This is true especially where the machine has but one set. Taken in connection with the wear of the lining material this prevents the surfaces from gripping as they should.

The parts may be repaired easily and at a very slight expense. At Fig. 7 A is depicted a method of rebuilding the face of each contact point. The ends are first trued up and steel plates cut to fit. Two holes are then drilled and countersunk so that the heads of the binding screws will not be worn. The apertures are next capped and fastened securely by screws. These should be well below the bearing surface of the plates.

Another method is outlined at C. Here, cap screws are utilized. Holes are drilled and tapped to take the members which are held by a lock nut. This repair also is made easily and has the advantage of being adjustable.

BEVELS SHOULD BE ADJUSTED.

Bevel driving gears should be meshed and lubricated properly else they will be noisy and the parts worn unnecessarily. In addition, power is wasted. Almost any pair will run with a near approach to silence if correctly adjusted and oiled. In modern axles it is possible to reset these members and eliminate the grinding noise.

HANDY DRIVING SPANNER.

An English concern has brought out a new form of driving spanner which is shown at Fig. 7 B. Frequently it is difficult to start a nut which is tight either by reason of its natural fit or through being placed in a position that is inaccessible. The usual method is to employ the cold chisel and hammer. This is bad practise, however, and should not be resorted to until other means have failed. The operation of the device is obvious. It is placed over the refractory member and a punch and hammer utilized. These spanners are made in different sizes and will start nuts which refuse to yield with the ordinary box set wrench.

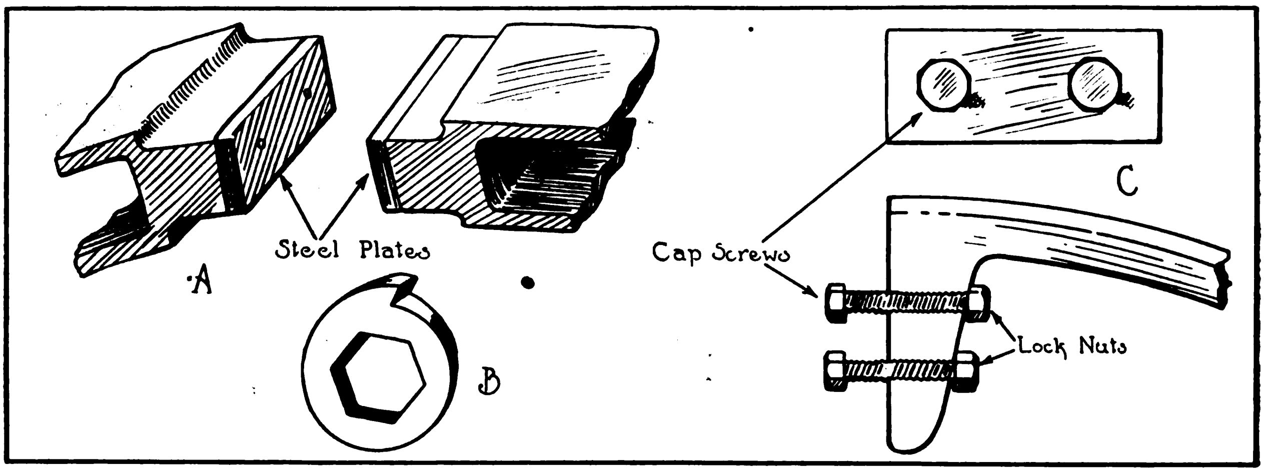

Fig. 7—Some Shop Repair Hints: A, Repair of Worn Brakes of Expanding Type; B, a Handy Spanner for Starting Stubborn and Inaccessible Nuts; C, Another Method of Restoring Worn Brake Surfaces.

PROPER TIMING OF THE VALVES.

To obtain the greatest efficiency from an internal combustion motor it is essential that the valve and ignition timing should be correct. The average motorist hesitates to attempt the correction of improper operation in either, and although absolutely proper timing of valves is a delicate task, requiring as it does an expert, considerable improvement may be effected by the novice.

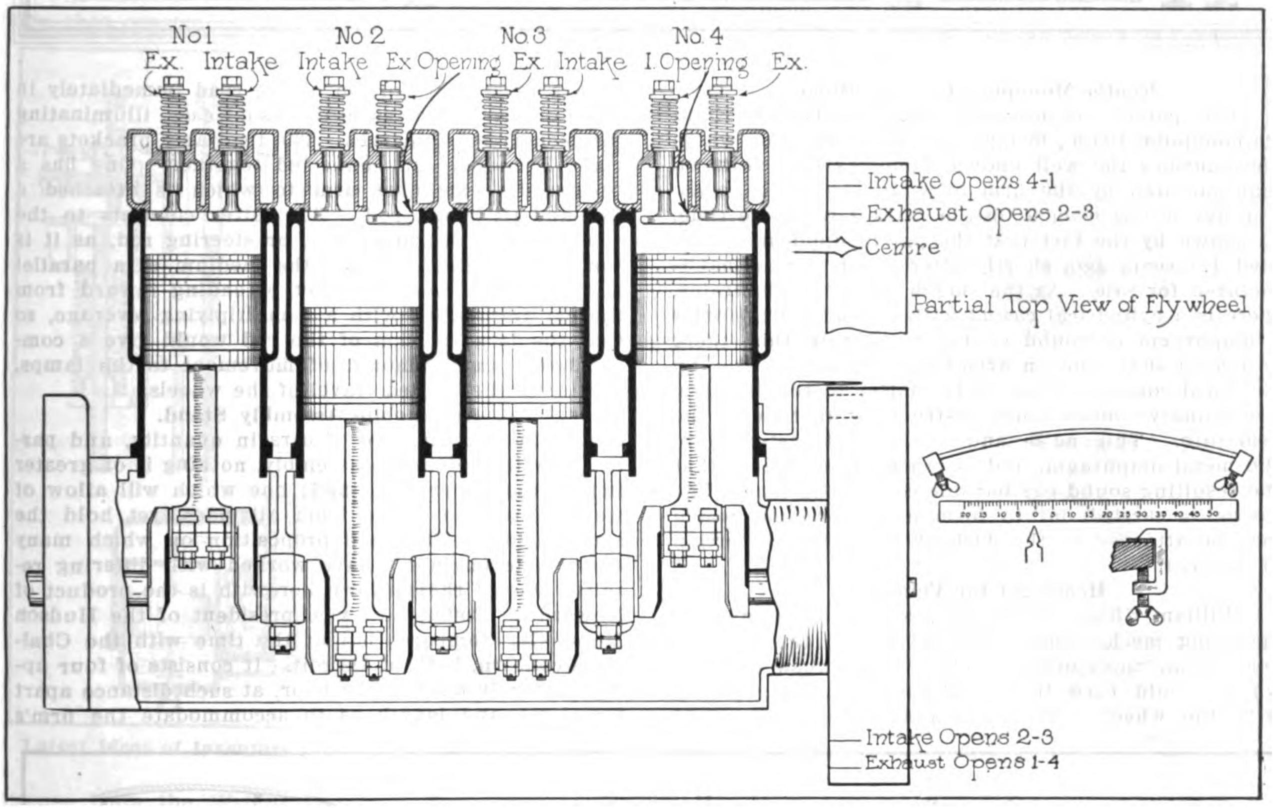
Generally speaking, not much can go wrong with the engine to put the valves out of time. Usually wear in a number of places such as cams, tappet rods, plungers, etc., will bring about a loss in power. The constant hammering of the tappet against the end of the valve stem sometimes results in this being flattened out causing a valve to open too late and close too early, or not lift high enough, and thus retard the flow of gas to the cylinder. Excessive wear of the gear teeth on the crank and camshaft, or if either be loose, will affect the operation of the cams and consequently the timing. With the large gears, such as are now utilized in motor car construction, the amount of wear taking place would not make any great difference.

Markings on Flywheel.

The correct opening and closing of valves is marked on the flywheel by the majority of manufacturers. These figures puzzle the novice, but are easily understood if the motor's cycle of operations be taken into consideration. The figures, 1, 2, 3, 4, represent the cylinders while the letter I means the intake valve and E designates the exhaust. Thus, the marking I. O., 2, 3, signifies the intake valves of the second and third cylinders open. Another set is I. C., 2, 4, which denotes the time the intakes close. When the letter C is used alone it indicates centre.

The explosions of a four-cylinder motor do not take place in order; that is, the arrangement of the crankshaft is such that two pistons are up and two down at the same time as will be noted in sketch. In this instance the first cylinder is about to be ignited by the spark while the fourth is about to take in a charge of gas. The pistons in the second and third cylinders are nearly at the bottom of the stroke and these are exhausting and compressing respectively.

The order of the firing is 1, 3, 4, 2, and it will be seen that the first to explode is No. 1, the next No. 3 and the last is the second cylinder. This order may be 1, 2, 4, 3, according to the design of the engine. In either case there are four strokes of the piston and two revolutions of the crankshaft to bring about one impulse or firing stroke. By referring to the firing order below the illustration it will be noted the sequence of the strokes is: Firing, exhaust, compression and suction of cylinders 1, 2, 3, and 4, respectively. By utilizing these tables one may become familiar with the order of explosions and these figures may be employed in timing where the flywheel is not marked.



How Valves Are Timed and Tappets Adjusted by Utilising the Markings on the Flywheel.

FIRING ORDER 1-2-4-3.

Cylinder 1	Cylinder 2	Cylinder 3	Cylinder 4
1—Firing	Compression	Exhaust	Suction
2—Exhaust	Firing	Suction	Compression
3—Suction	Exhaust	Compression	Firing
4—Compression	Suction	Firing	Exhaust

FIRING ORDER 1-3-4-2.

Cylinder 1	Cylinder 2	Cylinder 3	Cylinder 4
1—Firing	Exhaust	Compression	Suction
2—Exhaust	Suction	Firing	Compression
3—Suction	Compression	Exhaust	Firing
4—Compression	Firing	Suction	Exhaust

Checking Valve Action.

Where wear has taken place at the tappet or valve stem, and these members are adjustable, the efficiency of the motor can be improved greatly by resetting to conform with the figures previously referred to on the flywheel. The usual method is to lengthen the tappet until an ordinary cardboard may be inserted and while this is commendable a better way is to check up the lift of the valves, and this operation is not a difficult matter.

As has been explained the crankshaft makes half a revolution to each stroke. Referring again to the drawing it will be seen that the first cylinder is about to fire and that both valves are closed. The exhaust of the second is about to open. If the timing be correct, the indicating arrow, as shown, will point to the marking E. O., 2, 3. If late these figures will pass by the indicator and the exhaust tappet of the second cylinder should be adjusted until the valve starts to open on the line. Moving the wheel slightly the marks I. O., 4, 1 will appear as the intake valve of the fourth cylinder should start to lift and if it does not, this should be adjusted. The flywheel is now given nearly a half turn when the markings for the exhaust members, 1 and 4, and intake 2 and 3, will appear and can be regulated.

Some makers include the closings on the flywheels and these also can be checked, but many simply mark the openings as too many figures are apt to confuse the amateur. It is not a good plan to attempt improving the setting of the valves as marked by the manufacturer for the motors are thoroughly tested and valves timed to give the best results by the designers.

Timing from Crankshaft.

Where the flywheel is not marked the timing will have to be secured from the factory, but a gauge that will prove useful in timing the valves from the crankshaft is shown in sketch. The device consists of a piece of brass about .0625 inch thick by one wide. As the diameter of the average flywheel is approximately 15 inches, a foot of metal will be sufficient. The fraction of an inch that equals a degree on the flywheel is figured out and marked on the brass. The degree can be ascertained by calculating on the basis of 360 degrees to a circle.

In using the instrument the top and bottom centre of the flywheel are located. This may be accomplished by inserting a rod through the opening in the compression cock or by removing the crankcase to ascertain when a piston is at the bottom and top of its stroke. The rule is then laid upon the flywheel with the zero mark under the usual pointer that is affixed to the motor. The points are then marked off or compared. The device can be fastened to the flywheel by clamps as indicated in the illustration.

All timing should be done when the motor is hot in order to secure the best results. The relief cocks should be opened to reduce compression so that the flywheel may be rotated easily. If the motor be not equipped with these devices the spark plugs may be removed. The adjustment of the valve openings is a simple matter and the operation will be facilitated by studying the accompanying illustration, which was so drawn as to make clear the valve openings and their markings on the flywheel.

RECENT PATENTS of INTEREST

Kent's Monoplex Electric Horn.

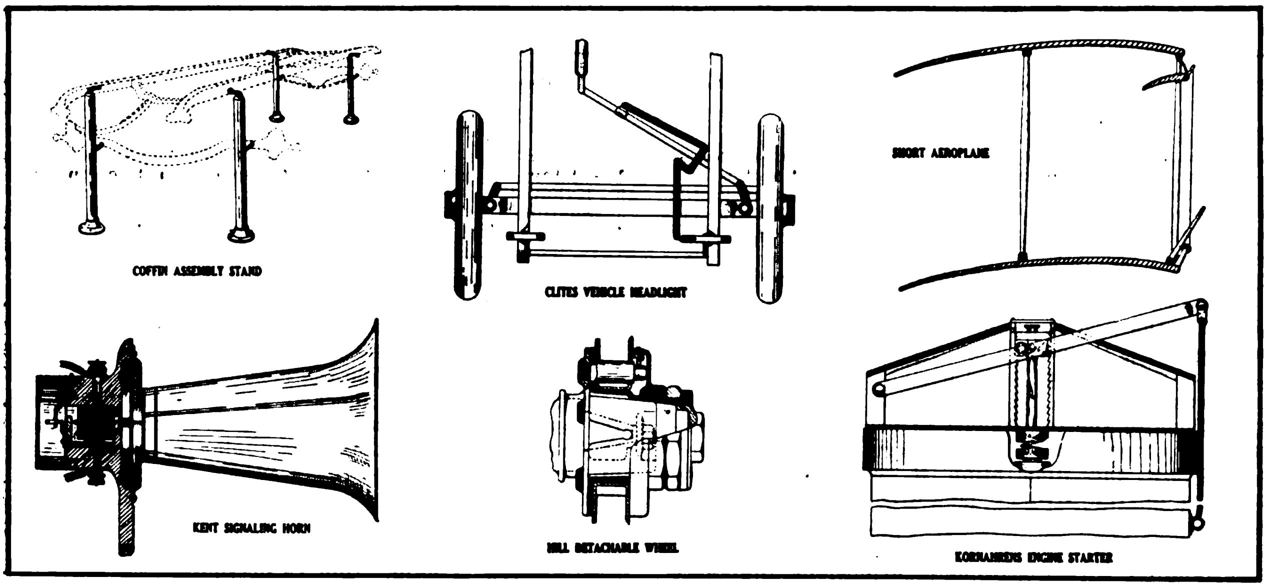
The patent recently granted A. Atwater Kent, Philadelphia, Penn., brings out the combination which distinguishes the well known Monoplex electric horn, manufactured by the firm of which he is the head. The device has been upon the market for some time, as shown by the fact that the patent application was filed 1.5 years ago, shortly after which it was manufactured for sale. As the sketch herewith illustrates, there is a cylindrical casing with an end which forms a diaphragm or sound chamber. Within this, there is a fixed shaft and an armature mounted on it. An electrical connection causes the latter to rotate, when a stationary contact point is struck by another on the armature. This noise and action is transferred to the metal diaphragm, and is repeated so rapidly that the resulting sound has but one continuous tone. The casing is carried out to form a flat bracket, which may be attached to the dash or other handy portion of the car.

Headlight for Vehicles.

William Clites, Elliott, Ia., has just patented an operating mechanism for connection to the steering gear of an automobile, truck or other road machine which would turn the headlights mounted upon it with the wheels. In this manner, the light would always cover that portion of the road immediately in front of driver, not as is the usual case, illuminating the scenery on all curves. The two lamp brackets are made swivelled and connected together. One has a backwardly extending arm to which is attached a fore-and-aft reach rod. The latter connects to the steering gear operating rod, or steering rod, as it is sometimes called, through the medium of a parallel motion. This has a bracket extending inward from the car framework with a demultiplying leverage, so that the large motion of the rod would give a comparatively small amount of movement to the lamps, similar to the limited travel of the wheels.

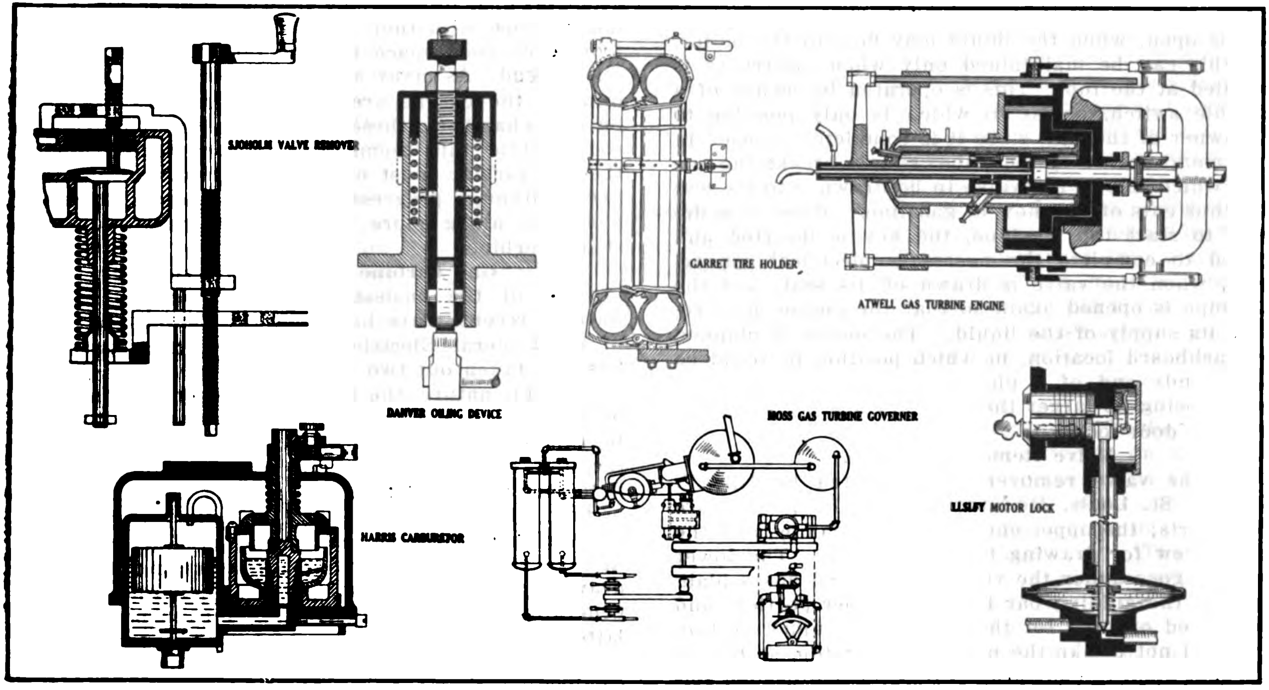
Automobile Assembly Stand.

In the manufacture of cars in quantity, and particularly in the chassis assembly, nothing is of greater import than a proper stand; one which will allow of working on the frame from all sides, yet hold the same rigidly. This is a proposition on which many automobile engineers have worked with differing results. One of these shown herewith is the product of Howard E. Coffin, now vice president of the Hudson Motor Car Company, but at the time with the Chalmers concern, both of Detroit. It consists of four uprights, firmly fixed to the floor, at such distance apart for width and length as to accommodate the firm's



Ideas Which Have Emanated from Automobile Engineers and Inventors During a Portion of the Past Year, Including Self-Starters, Headlight Controllers, Detachable Wheels, Aeroplane Details, Electric Horns, and Assembling Stands.

standard chassis frame. The top carries a swivel end, which is flattened in a vertical direction with a hole for a horizontal bolt. Moreover, its height in the support is variable at will, but may be fixed at any predetermined distance. The combination patent calls for a projection on each post, the length of which would fix automatically the position of the axle; the front for one pair and the rear on the other. As drawn, the two forward swivel ends are turned inward from the supports, while the rear ones are turned outward. This feature allows of placing the uprights inside or outside as is most desirable considering the chassis to be worked upon. The idea is susceptible to further amplification, in that the lower lugs on the posts might be made adjustable and marked, so as to permit of changing wheelbases by a few inches by a simple alteration of the adjustment. This would be handy for many firms which manufacture touring cars and runabouts with identical parts but a shorter wheelbase and more inclined steering post.



Latest Ideas of Inventors Working on Automobile Parts, Accessories or Appliances, Including Two Gas Turbine Patents.

Aeroplane Construction Details.

The Short Bros. of England, the well known concern that constructs the Short-Wright biplane, under license from the Wright Company, Dayton, O., has produced a combination of ailerons with the two main planes on which it has been granted an American patent. This includes a small, comparatively narrow surface set directly under the leading edge of the upper plant, and pivoted in such a manner that they may be turned to offer a little wind resistance to forward progress or much as desired by the pilot. The idea of the small surfaces is to deflect the air currents to or from the forward portion of the main aerofoils as desired. With this, a lever at the lower plane regulates the movement of the ailerons. By varying the lengths of these and their controls, it would be possible to render the half of any portion of the upper plane temporarily inefficient insofar as its lifting power were concerned, thus controlling the vertical and turning movements. This appears to be the Short idea, judging from the various claims.

Detachable Form of Wheel.

Many men have worked on the detachable wheel; that is, the form which is removable as a unit, but more attention has been paid to this matter in England than in this country. An Englishman, Barton B. Hill, Stoke Newington, London, recently has taken out a patent on a new form. This is built with a shell-like hub with a number of pins, the flange having a series of holes to receive the same. The wheel portion also carries a locking device, which rotates with it and grips all of the pins in such manner as to unite the hub with its spokes, felloe and tire to the flange and axle as firmly as if the two were built together. An external member is rotatable as soon as a locking nut has been loosened, and when this is the case, may be turned relative to the rest of the wheel, thus operating a cam member which loosens the lock, frees all pins, and thus allows the withdrawal of the wheel in toto.

Gasoline Engine Starter.

The idea of a spirally grooved shaft in which a pin engages is not new for starting purposes, but Henry L. Kornahrens, Oakland, Cal., has combined them in a novel manner to produce a good looking device. The usual starting shaft with its jaws to engage with duplicates on the crankshaft is prolonged forward for a considerable distance, this latter portion carrying the deep spiral groove. A long bar crosses the front of the frame, and is operated on the driving side of the car by a lever and rod connection which pulls it straight backward. At the middle, a downwardly projecting pin fits into the groove in the starting shaft. The former moves straight backward, hence the shaft must be forced first backward until the jaws engage, then turn, until the pin reaches the limit of its motion. As the hand leverage may be considerable, and that at the front bar is also, the driver has a big advantage over the usual 14 or 16-inch lever.

Garrett's Tire Holder.

With the great increase in carrying of extra tires, either inflated or without air, as well as on a rim, so as to be ready for use at a moment's notice, there has come a large demand for superior forms of holders. Without a proper retaining iron, it is impossible to carry the valuable accessories in a manner which will insure them correct care. A new design which has some valuable features has just been produced by Frank S. Garrett, Wilmington, Del., under patent 1,000,508. Three supports are provided, one of which may be set horizontally at the top, its purpose being to hold the tire or tires in their desired position. Two others are made in sections with a connecting strap, so as to retain them against the holders. On the folding parts, the faces are shaped to fit the tire, while the permanent top iron carries a pair of flat plates with a similar curvature.

Simplified Form of Carburetor.

In his new carburetor, the subject matter of patent 1,000,518, John Harris, Cleveland, O., has provided a complete and permanent standpipe for fuel in the form of a cup shaped bowl within the vaporizing portion of the device. This is connected with the float chamber through a passage, and is opened and closed by means of a rotating valve of the tapered plug type, carrying a registering slot. When this and a hole in the casing are in line, the fuel is free to flow up into the cup and form a deep puddle there, subsequent vaporization being of the surface order, that is, air passing over the surface of the puddle picks up its gasoline in that manner, as opposed to the more usual spraying method. The operation of this valve is by the hand throttle, but in moving it also picks up and carries along with it the disc which controls the size of mixture outlet.

Illsley Motor Lock.

In the lock on which F. P. Illsley has just been granted patent 1,000,523, and which he has assigned to the Sireno Company, New York City, an electric circuit is used to control the motion of a valve which opens or closes the fuel flow pipe. The normal position is open, when the liquid may flow to the motor, but this can be maintained only when electricity is supplied at the top. This is operated by means of a suitable switch, access to which is only possible to the owner of the key, since it is completely housed in by a metal case. This member simply breaks the circuit, which allows the valve to be drawn into its seat and thus cuts off the flow of gasoline. When it is desired to start the machine, the key is inserted and turned to complete the necessary electrical connections, when the valve is drawn off its seat, and the fuel pipe is opened again so that the engine may receive its supply of the liquid. The device is planned for dashboard location, in which position it would be both handy and of a pleasing appearance, the projection being no larger than the keyhole section of an ordinary door lock.

Valve Removing Device.

In the valve remover just invented by Nils P. Sjoholm, St. Louis, Mo., patent 1,000,559, there are three parts; the upper end and lower clamps, and the hand screw for drawing them together. The lower member goes under the valve spring, and has a plain hole for the guiding bar from the upper portion, and a threaded opening for the screw. The upper section is shaped not unlike the usual cylinder top, so that it is seated upon the surface, while a square headed setscrew projects down into the combustion chamber and rests upon the valve. This prevents the latter from rising, when pressure is applied to the under side of the valve spring. The operating part is a straight bar with two diameters at the bottom, both threaded. The smaller is right handed and fits into the lower member, while the larger is left and engages the top portion. The handle when turned pushes the first in one direction and the other, oppositely. The top bar and the extension arm of the lower are both made with a series of holes, spaced out from the utmost position so as to render the apparatus usable on large and small cylinders. In the sketch, it is shown near the limit of motion, as will be noted by the position of the valve key below it.

Pushrod Oiling Device.

This is a simple little device intended to make automobile engines operate with less noise and friction. To that end, the inventor, Andrew C. Danver, Providence, R. I., has incorporated in his apparatus, on which he has been granted patent 1,000,722, a hollow pushrod. This works in a bushing which has the form of a double annular ring. The central bolt is for the rod, while the outer opening contains a supply of lubricant. In this another annular ring shaped projection on the top of the pushrod works up and down, being restricted by the spring which is placed in this chamber. When it comes down, it acts as a plunger pump and forces oil through holes in the pushrod to the moving surfaces, which are thus quieted and rendered frictionless. On the upstroke, this becomes a suction member drawing in a fresh supply of lubricant from outside source. The upper end of the rod carries a third annular ring shaped part which fits around the outside of the guide and prevents leakage. The sketch herewith shows the construction more simply than it is possible to describe it.

Atwell Gas Turbine.

The gas turbine has long been the dream of inventors, for it would convert the explosive force of gasoline vapor or others immediately into rotary motion, instead of into reciprocating and then rotary, with the consequent losses, as in all other forms. A Baltimore man, Edwin Atwell, has just been granted a patent, 1,000,882, on a form which presents considerable novelty. This has a rotor with a plurality of radially disposed open ended spiral passages, a driving shaft connected with this and a long cylinder, which has a series of passages to register with those mentioned extended within the rotor. Inside of the cylinder, is a rod adapted to carry a number of separate pistons, forming the interior into as many cylinder heads, with their individual values. A passage from each such space runs to the main cylinder receiving end. As many spark plugs or other means of igniting the charge are provided as there are combustion chambers, these being timed with the piston rod. While this seems a very complicated device, the gas turbine must of a necessity be one of many parts, although progress abroad, notably in Germany, has been along more simple lines, parallel to the steam turbine.

Gas Turbine Governing Device.

One of the busiest workers along gas turbine lines in recent years has been Dr. Sanford A. Moss, of the General Electric Company, Lynn, Mass. He has just taken out two patents, 1,000,968 and 1,000,969 of this nature, the former of which is illustrated, while the latter refers to a regenerator to be used in this system. The governing method consists of the unit itself; a combustion chamber for supplying fluid and separated from the moving parts; a source of fuel, which discharges into the latter; a valve controlling this through a ratchet and pawl arrangement, and a speed-responsive device actuating it. The drawing shows the combination, including the regenerator previously referred to, the purpose of the latter being to utilize the heat of the exhaust for warming the mixture previous to its entry into the combustion chamber. In the system, there appears to be an air compressor driven by belt from the turbine shaft, which pumps into a receiver, the air thence passing through the regenerator, and to the combustion chamber, where oil is sprayed into it and the mixture compressed. The governor seems to work upon the oil passage, preventing the flow or allowing it to increase as the speed becomes too high or too low.

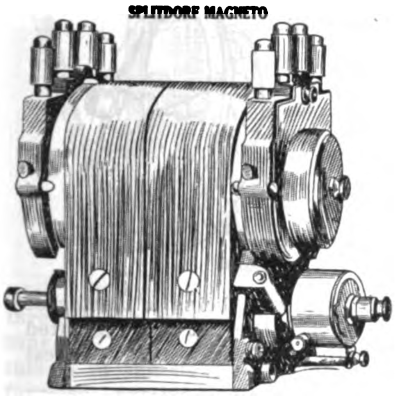
FEATURES OF VANADIUM.

"A great deal has been written and said about vanadium, its peculiar effect upon steel and its application in automobile construction," says M. J. Hammers, general manager of the Abbott Motor Company of Detroit. "Many prominent scientists and metallurgists concede that it acts largely as a scavenger and exercises a beneficial influence on almost all of the carbon and alloy steels, being introduced in very small quantities during the melting process. Its chief office seems to be that of removing the last traces of oxygen and oxides, as well as minute amounts of nitrogen. Vanadium aids the finished product, giving it closeness and fineness of grain, elasticity and toughness. In addition the steel is sufficiently soft in its annealed state to be turned and machined like low carbon steel."

ACCESSORIES AND APPLIANCES THAT SELL.

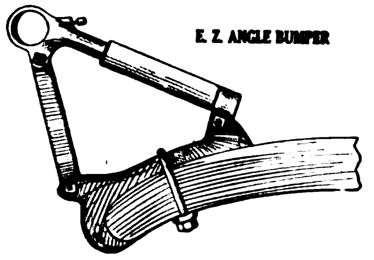
The Splitdorf Double Distributor Magneto has been developed to meet the large demand which has arisen during the past year for a stable method of producing two sparks simultaneously within the combustion chamber. When it was announced that this would add from 10 to 15 per cent. to the power developed by the engine, the first call for suitable instruments of this type came from owners and drivers of racing cars. That was followed shortly by similar action on the part of car owners and users, with no desire to race, but simply a wish for all the power the engine size could give. So great was the latter that C. F. Splitdorf, New York City, a prominent manufacturer of ignition apparatus, was obliged to bring out the instrument pictured herewith. This is equipped with a double distributor, the arrangement being such that the two sparks occur at exactly the same instant. Otherwise, it has much the appearance and size of the better known Splitdorf product. The weight is practically no greater, so that for aeroplane use, it presents the important advance of giving greater power with no addition to what the planes must lift.

SPLITDORF MAGNETO



★

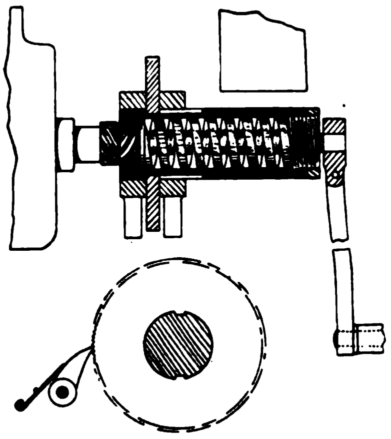
E. Z. Angle Bumper is a new device, constructed by the Cox Brass Manufacturing Company, Albany, N. Y., for attachment to the front of a machine, where it saves the delicate parts from the shock of collisions. It differs from the more usual and older straight forms in that the cross bar is carried up higher, the whole thus meeting the demand existing. Many cars are constructed so as to require a high bar, the manner of holding it up in this device being the angular construction which raises it seven inches. The coil spring, which is four inches long, of .25-inch tempered steel and fine quality, is enclosed within the cylindrical rear portion. In attachment, this form presents the unusual advantage of requiring no drilling whatever, since a special clamp has been developed, this, with the shape of the base portion, holding it firmly in place.



E. Z. ANGLE BUMPER

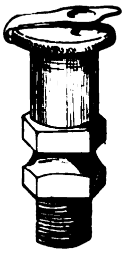
★

The C C Safety Crank is another development of the many efforts to evolve a safe means of starting the car by the usual handle. This was invented and is now being constructed by Charles C. Carll, Indianapolis, Ind. The design is such that the operator may twirl the handle or arrange a lever at the side to do this, by adding a winding drum for the operating cable. The basic idea is the use of a worm thread. The crank is hollow and carries a spring, while the engine end has a quadruple worm which mates with a similar one on the end of the crankshaft. The compression of the spring is sufficient to turn the engine over, and it is wound by means of the handle and the ratchet wheel. A backfire compresses it, the resulting pressure screwing one worm from the other, when the shaft turns idly. In use the cranking may be done with ignition and throttle shut off, and the spring used to turn the engine over later. This is convenient in that the car operator first cranks with everything shut off, or possibly with the throttle open, but ignition in the "off" position. Then, getting into the seat and throwing on the switch, the starter ratchet may be released and the spring permitted to wind the engine over.



CARLL SAFETY CRANK

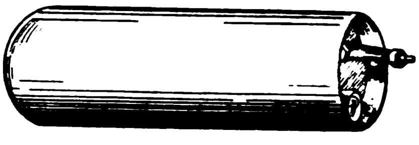
Becco Priming Cup is the trade name given to the newest product of the Beck Company, Rockville Centre, N. Y., a prominent producer of small specialty accessories, all of which are named Becco after the first letters of the firm's name. The priming device is intended for use on a motor, where its simple lines give a more pleasing appearance than other forms. The cap is screwed on firmly, but has a large hole at one side, normally closed by a spring cover. To use this as a primer, the spring is lifted vertically, then swung to one side, thus uncovering the hole. For closure, the end of the spring is struck lightly on one side, when it will jump back into place, the elasticity of the material producing the action and a slight extrusion on the under side centring itself in the hole.



BECCO PRIMING CUP

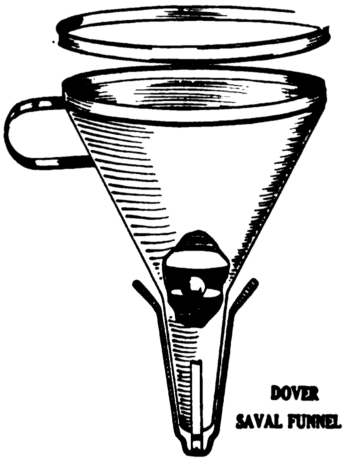
★

Searchlight Gas Tanks are containers for carrying on the car a supply of acetylene gas in a very compact form. Many persons prefer the tank carrier to the small, portable generator. The former contains a substance which absorbs a very large quantity of the compressed fluid, thus holding a greater amount than its size or cubical contents ordinarily would render possible. The Searchlight form has been brought out recently by the Searchlight Gas Company, Chicago, with offices in all of the principal cities, and a very large number of refilling stations scattered around the country, many additional ones being under construction or contracted for completion previous to January, 1912. This is a popular priced tank, and is claimed to give more and better light than others. The container is bought originally filled with gas, but when empty is exchanged at one of the numerous stations for another that is filled.



SEARCHLIGHT GAS TANK

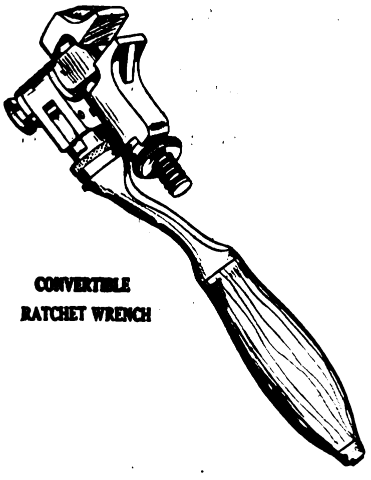
The Saval Funnel was produced by the Dover Stamping and Manufacturing Company, Cambridge, Mass., to economize on gasoline when filling a tank. The construction is such that lifting the funnel off the tank opening stops further flow of liquid, and the remainder in the upper portion may be poured back into the can. This result is brought about by an internal ball which is moved up and down by pressure on four external flat springs. When the accessory rests upon these, its weight pushes the ball off the seat, and the liquid flows, but when it is lifted, the valve closes and refuses further egress. In addition, it has a movable hoop for the upper edge, which will hold a chamois or brass strainer, a side handle for convenience in using, and is constructed from heavily copper-plated steel. This firm makes a number of other similar accessories in all varieties of size, shape and method of use, and each of a high grade material.



DOVER SAVAL FUNNEL

★

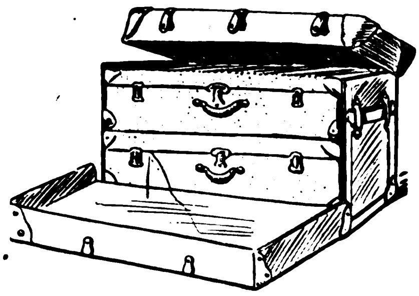
The Convertible Ratchet Wrench, pictured herewith, is made by the Convertible Ratchet Wrench Company and sold through Asch & Co., Broadway, New York City. This is an all-around tool, intended to replace straight and S forms. It has a curved handle which carries a ratchet. Above this is the swivel joint which permits action at any inclination, while the thread and thumb screw control the width of jaw opening. The swivel allows placing at different angles and corners, while the ratchet permits operation where space is limited. This gives a very handy tool, which, the maker states, may be used in some 32 different positions. This makes apparent at once the saving of dead weight on the car, allowing as it does the elimination from the vehicle tool kit of all other forms of flat, S and spanner wrenches. In addition, considerable bother is done away with in looking for the various forms, in taking them out of, and putting back in, the tool box, as well as the possibilities for loss and further inconvenience when utilizing them on the road.



CONVERTIBLE RATCHET WRENCH

★

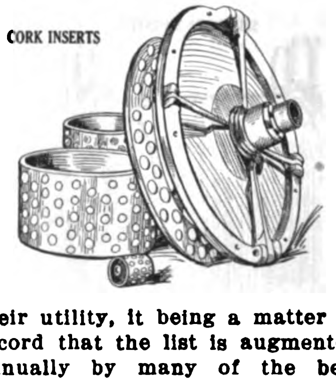
The Kamlee Trunk, shown herewith, is like all automobile trunks, a water and dust proof carrier for extra clothing. This product of the Kamlee Company, Milwaukee, Wis., is made in a number of sizes and styles, that depicted in the sketch being the regular with two inner suit cases. By opening a lock and two clasps, the top cover hinges back and the front drops down, exposing both so that they may be lifted out separately or together. The feature of construction which has made this form popular is the interlock edge with a rubber tubing buffer in the bottom of the grooves.



KAMLEE TRUNK

★

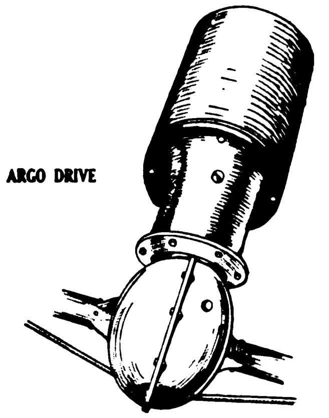
Cork Inserts are used as a wearing surface in brakes, clutches and other parts, their special function being to produce a higher coefficient of friction than is possible with any other material. This is a quality which is inherent in the cork, about twice as high a figure resulting as with iron on iron, steel on steel or other combinations. The use for this purpose is patented by the Cork Insert Company, Boston, Mass., which firm is selling licenses therefor. A recent change has been made in the fees asked, by which a greatly lowered price results. The sketch shows pulleys and a plate clutch fitted with the inserts. They are as applicable for the former in the factory which makes the machine, as on the latter in the finished car. The very large number of manufacturers adopting these for use in clutches and brakes presents a fair index of their utility, it being a matter of record that the list is augmented annually by many of the best makers.



CORK INSERTS

★

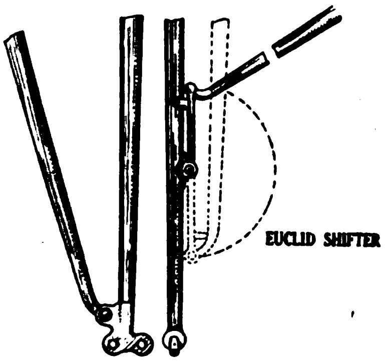
The Argo Worm Drive, which is a final member in the car propulsion, was developed by the Argo Electric Vehicle Company, Bay City, Mich., for use on its line of battery driven machines for both commercial and pleasure service. As shown herewith, the entire differential as well as reduction gears are enclosed by the small, compact and exceedingly neat metal housing. The size of this is the most remarkable point about it, although its simplicity merits considerable attention. There are four separate parts to the assembly: The front casing which is a round shell, the middle portion of somewhat similar shape but having two flanged ends for attachment to the other members, and the rear half which is divided vertically. Of the latter, each part rivets and is brazed to one axle tube, so that when bolted together, the two form a complete axle housing.



ARGO DRIVE

★

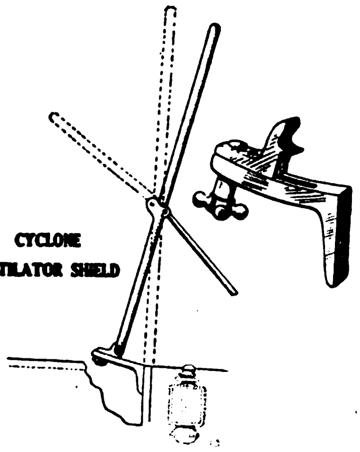
The Euclid Bow Shifter is a novel part of the top supports, which has been marketed recently by the Cleveland Hardware Company, Cleveland, O. The usual socket is constructed so that it is almost impossible for one person to put up or take down the top. This device is designed to remedy that need and has a forward bar which controls the front edge of the cover, attached through the medium of a double hinge. When the inner end of this is in the upper position, the forward portion of the top is down, while with it turned over to the down location shown dotted, the bar must assume a vertical attitude bringing the front of the top back to the out-of-use condition.



EUCLID SHIFTER

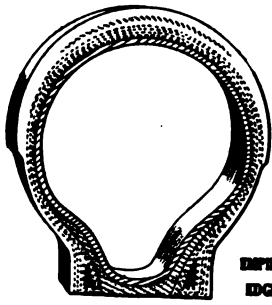
★

Cyclone Ventilator Windshields meet the insistent demand for a form of wind break which will permit of some ventilation in the front seat compartment on fore door cars. The rapid increase in this type of body has evolved this demand, since the additional doors make the forward division close and exceedingly warm, especially below the seat line; that is, for the feet and legs. The Sprague Umbrella Company, Norwalk, O., has just designed and placed on the market this device, which consists of a fixture for attachment to the lower edge of the shield. There it allows of loosening the framework and tipping it sufficiently to admit a small current of air over the hood and dash under the shield through the opening formed, and by the latter is deflected downwards to the floor. There it performs the desired cooling. The sketch shows the complete device as well as the clips which do the work.



CYCLONE VENTILATOR SHIELD

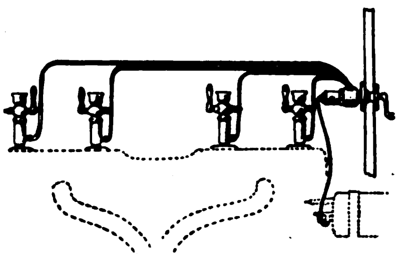
The Empire Straight Edge Tire is a new form of Dunlop shape which has the additional merit of being quick detachable. It is made by the Empire Tire Company, Trenton, N. J., maker of the well known brand of standard shoes and tubes, with the same care, selection of materials and workmanship as the better known product. It is offered in 22 sizes which will be found in stock wherever this make is sold. They are as follows, the full list being given for the convenience of motorists now in the market for this form of casing: Three and a half by 30, 32, 34 and 36; four by 30, 31, 32, 33, 34, 35, 36 and 37; 4.5 by 32, 33, 34, 35, 36, and 37; five by 35, 36 and 37, and 5.5 by 37.



EMPIRE STRAIGHT EDGE Q. D. TIRE

★

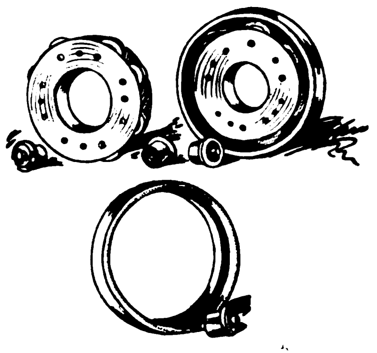
The Disco Self Starter, is made by the Ignition Starter Company, formerly of Grand Rapids, Mich., but now of Detroit. It was originally called the Grisco, the first two letters coming from the town, but the move altered this so the name was changed to suit. This device includes the collection from cylinders of a running engine of sufficient gas under pressure to restart the same, when a stop has been made. This is stored in a circular tank, whence it is available for instant use. The pressure of a dash button permits this to flow through a distributor at the rear of the engine to the cylinder which is ready for firing. In this manner, the motor is turned over by fluid pressure, rotation continuing until the motor picks up its regular cycle.



DISCO SELF-STARTER

★

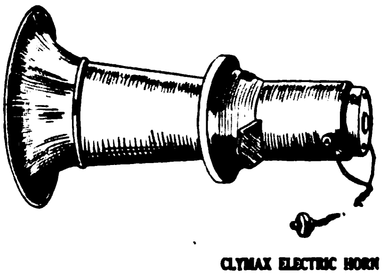
Bower Roller Bearings are of the straight type, but have a formed shoulder, which abuts against a seat in the raceway, thus permitting of the absorption of thrust as well as radial loads. This gives to the roller the single task of carrying radial stresses for which its shape fits it pre-eminently, while the collar on the end of it, does not carry any load in a radial direction, each being made a specialist, so to speak. This principle of action permits the use of unusually large diameters of roller, thus giving the bearings high carrying capacity in comparatively small sizes. Another advantage of the large rollers lies in the slower speed at which they travel, this giving either longer life or if preferred higher spindle speeds. The maker, the Bower Roller Bearing Company, Detroit, Mich., also makes the Zahn bearing, which has the collar replaced by a notch.



BOWER ROLLER BEARING

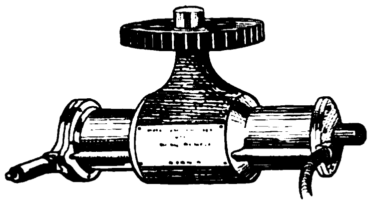
★

A Clymax Electric Horn is suitable for use on any size or make of car, this being a recent addition to the list of current operated signalling devices for automobiles. It is made by the Nonpariel Horn Manufacturing Company, New York, and has all of its mechanism enclosed so the unit as illustrated herewith is complete except the placing of the button which operates it and the connection to a source of energy. Within the rear end portion is placed a small electric armature, which a flow of electricity causes to rotate. Turning this drives forward four striking points, which hit the metal diaphragm at three spots, set 120 degrees apart around the circumference. The action then is not the repeated hammering on a single place as in some horns, but is distributed over a series of 12. This can not help but make for long life and satisfactory action. Each hammer is actuated through a small coil spring which not only absorbs all reflex action but also takes up wear automatically.



CLYMAX ELECTRIC HORN

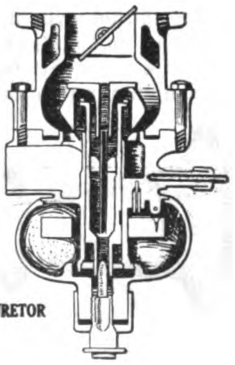
Hanna Air Pumps are made by the Troy Auto Specialty Company, Troy, N. Y., and as the accompanying sketch shows, are of the duplex type. That is to say, they have two pistons set on opposite sides of the shaft in the manner which in gasoline engine practise is called "opposed." The cylinders are of phosphor bronze, while the pistons are of steel. These are fitted with two cast iron rings, of the usual spring type, this material being used because of its hardness and excellent wearing qualities. The pump is gear driven, the large member, shown on top in the illustration, being utilized for the drive. This is set in any convenient position to the engine or a rotating shaft, a small gear thereon meshing with the large one. Otherwise, the attachment is very simple, consisting in the usual case of drilling one or two holes for bolts. The material and workmanship is first class, and the result is a pump, which being built as well as the engine, will last fully as long.



HANNA POWER PUMP

*

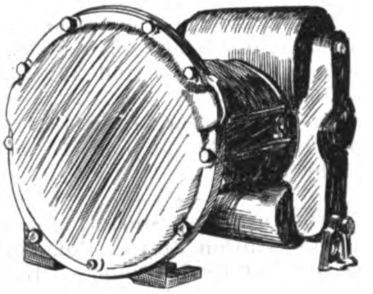
The Stewart Carburetor, one of the newest vaporizers to appear on the market, is a far western product, the maker, the Alfred C. Stewart Machine Works, being located in Los Angeles, Cal. A section is shown herewith, this bringing out the construction marked by the entire elimination of springs, gravity being depended upon to operate the only moving part, the air valve. It is held by the maker that springs may lose their temper and thus become unreliable, but that the force of gravity never alters. This valve, which is given the distinction of being the principal part, is in three pieces, acting in unison, so the effect is as of but one. By its movement, it covers or uncovers openings through which air enters, carrying with it the gasoline spray and forming a combustible mixture. When the engine demands rise, the part lifts and a greater area of aperture is put into action, thus supplying the motor cylinders with more gas. The air passage is double, the inner part being somewhat tortuous, so that the intermingling is both complete and very intimate.



STEWART CARBURETOR

*

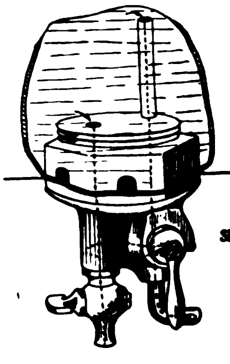
The American Electric Headlight is made by the Remy Electric Company, Anderson, Ind., also maker of the Magnetolite combination ignition and lighting current generator, as well as a full line of other ignition units and supplies. The latest product, which is shown in the appended sketch, is for lighting only, being intended as a source of energy for a single head or searchlight, or a pair of them. As the drawing brings out, this is massive enough to withstand road shocks.



AMERICAN ELECTRIC HEADLIGHT

Multibestos Brake Lining is a new frictional material for facing brake shoes, as its name indicates. This is specially woven by the Standard Woven Fabric Company, Worcester, Mass., upon looms which have been designed and constructed for this purpose. It is a mineral product composed of a series of brass wires interlaced with fibres of asbestos. By means of the process followed in its production, none of the layers or threads may become separated from the rest. This firm has produced water proof fabrics for many years, and its experience in the treatment of materials along these lines has brought about a skill which is applicable to heat proofing with equally good results. The handling of this substance includes the permeating of every interstice with a compound to the point of saturation. It is said of the resultant brake lining that it will not char or burn with the heat of friction, even when continued to a dull red; that it is, in addition, dust, water, oil and grease proof; that it is better than metallic, leather, fibre or other forms of lining; that it can be machined readily and will withstand the stresses incident thereto, and that it gives the maximum gripping effort.

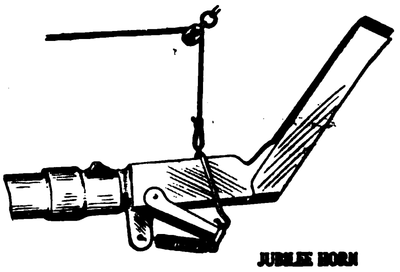
Sentinel Fuel Alarms were brought out to give warning to the driver of a car that his gasoline was getting low in the tank and required replenishing. They may be installed in any form of container, but a small flat spot being necessary for attachment. There is a standpipe, through which the fuel flows ordinarily. When the level falls below this, the motor stops, indicating that but an inch or so of gasoline is left. By turning the reserve cock around half way, this remnant may be utilized, the liquid then flowing through the hole beside the standpipe. The second pet cock is for cleaning purposes only and bears no relation to the operation of the device. When the main lever is set horizontally to the right, all flow is stopped and the car cannot be operated. It is made by C. J. Koller & Co., Philadelphia, Penn.



SENTINEL GASOLINE TANK ALARM

*

The Jubilee Horn, a new high class, mellow tone chime horn, is now being marketed by the Waite Auto Supply Company, Providence, R. I., and other dealers. This is an inexpensive product which can be attached by anyone with few tools, so that practically every car owner can afford one. It is adaptable to all sizes of machines from the smallest to the largest, and is made in different dimensions to fit the range of powers. It is self-cleaning and has no parts to get out of order. The method of operation is by pedal, which closes a gate and brings the sound chamber into play as a reflector of the exhaust gas passage. When possible, the maker states, the operating member should be placed so that the horn may be worked by the heel while the toe is actuating either brake or clutch.



JUBILEE HORN

In turning and shaping metal on the lathe, planer or shaper there are certain speeds which must not be exceeded or the tool will suffer injury. In taking a roughing cut on the lathe on wrought iron the speed must be lower than when a finishing cut is being made, because of the fibrous nature of the metal, but with the other metals the speed can be the same with roughing as finishing cuts. In the case of brass the feed is the same at all speeds, whether a rough or finishing cut is being made, though with cast iron the feed should be slower in making finishing cuts. With wrought iron and steel, the feed is faster on finishing cuts than on roughing cuts. As the diameter of the piece turned is increased, the number of revolutions is reduced in proportion.

Adjusting Valve Tappets—If a modern engine becomes noisy in the first few thousand miles of its running life, a likely cause is poor adjustment of the valve tappets. With the strong valve springs now used on nearly all cars, the tappet heads and valve stem ends wear faster than they used to do, and too wide a clearance at this point is a prolific cause of noise. The adjustment of the screwed tappet heads on any engine is considerably facilitated by the use of feeler gauges, plus a couple of special open ended spanners, which exactly fit the hexagons of the loose tappet head and its lock nut. A piece of tin, of about .031 inch in thickness, should be slipped between the exhaust valve stem end and the tappet head, after the engine has been revolved by means of the starting handle until the tappet to be adjusted is at its lowest point. The tappet head should then be screwed up till it nips the feeler gauge against the valve toe; then the lock nut must be tightened, and the gauge withdrawn. This plan is much better than a visual test. On inlet valves, the same process is followed except that the gauge is about .015 inch thick. The exhaust valve stems heat more and expand to a greater degree; therefore more clearance is needed between them and the lifting plungers.

Cleaning Oil Soaked Belt—When the belt has become oil-soaked and will not stay on the machine, a good method of cleaning it is as follows: Coil the belt loosely in a tub of sufficient size, and cover with whiting. Be sure that the whiting gets in between the coils of the belt, and it will be only a short time before the whiting will absorb the oil from the leather. It will then only need to be wiped clean to be ready for further use.

In buying round or square iron bar stock it is often desirable to know the weight of bars of certain section and length, with a view of more easily computing the cost and amount of material. The figures given above can be used for steel as well if allowance is made for the difference in weight, steel weighing 490 pounds the cubic foot. This will make but little difference in case of the bars of smaller section and in case of the larger diameters it will be merely necessary to add 1-48 of the weight to that given for iron for an accurate determination of the amount of steel in bars of the same size and length.

Contact Breaker Repair—A motorist was stranded one day by a small flat steel spring forming part of a magneto contact breaker parting. The car was equipped with magneto ignition only and there was no reserve system to run on. After some thought, the amateur repair man obtained a small Para rubber patch from the tire repair kit, folded it several times and squeezed it in between the rocker arm and a convenient screw that luckily lent itself to the purpose. A piece of fine brass wire was used to make a suitable contact, and with the rubber acting as a spring, the magneto worked almost as well as ever.

Peculiar Cause of Knocking—The car was a popular four-cylinder make about a year old. It was brought to the shop for a thorough overhauling, and for taking up all the bearings. When the job was complete and the engine operated, a very severe knock developed that sounded exactly like a loose bearing. After considerable experimenting, it was found that one of the pistons touched a shoulder in the top of the cylinder, this because the packing between the cylinder and crankcase had been reduced in thickness a trifle. A thicker packing cured the trouble.

A. L. A. M. STANDARD HORSEPOWER FORMULA.

5.875	149	13.812	27.625	55.250	82.900
6.000	152	14.400	28.800	57.600	86.400

The formula used generally in this country is that proposed by the A. L. A. M., which gives merely an approximation, but as it has been adopted by a number of states as the method of determining the amount of registration tax on a horsepower basis, the tabulation above will be serviceable for ready reference, as it not only indicates the bore in inches, but in equivalent metric units, and gives the horsepower for engines of that cylinder bore having one to six cylinders. For an odd number of cylinders, merely multiply the value given for one cylinder by the number of cylinders.

LENGTH OF STANDARD PIPE NIPPLES.

Nominal diameter	Outside diameter of pipe	Threads an inch	Overall length of nipples					
			Close	Short	Long			
0.125	0.40	28	0.750	1.5	2.0	2.5	3.0	3.5
0.250	0.54	18	0.875	1.5	2.0	2.5	3.0	3.5
0.375	0.68	18	1.000	1.5	2.0	2.5	3.0	3.5
0.500	0.84	14	1.125	1.5	2.0	2.5	3.0	3.5
0.750	1.05	14	1.375	2.0	2.5	3.0	3.5	4.0
1.000	1.32	11	1.500	2.0	2.5	3.0	3.5	4.0
1.250	1.66	11	1.625	2.5	3.0	3.5	4.0	4.5
1.500	1.90	11	1.750	2.5	3.0	3.5	4.0	4.5
2.000	2.38	11	2.000	2.5	3.0	3.5	4.0	4.5

There is often much confusion in the minds of those not familiar with mechanical processes caused by poor nomenclature or designation of sizes, and in no case is this shown more often than in determination of pipe and tubing sizes. As a general thing pipe is measured by the bore, while tubing dimensions are based on the outside diameter. As an example, a one-eighth inch pipe would actually be four-tenths inch outside diameter, a quarter inch pipe .54 inch outside diameter, the bore in each case being a little more than the size would indicate. A piece of tubing, at the other hand, would have an outside diameter equal to the size. The table above gives the sizes, the actual outside diameter and the number of threads an inch, as well as the overall length of standard pipe nipples commonly used in motor car work.

Hints on Tempering—To temper small springs, etc., heat to a cherry red and cool in rain water, dip in lard oil, hold over the fire until the oil burns off; repeat the oil dip twice more and then cool in oil. This is reliable if done properly.

SPEED OF TWIST DRILLS.

Diameter of drill	Speed			Diameter of drill	Speed		
	For soft steel...	For cast iron...	For brass......		For soft steel...	For cast iron...	For brass......
1-16	1824	2128	3648	1 1-16	108	125	215
1-8	912	1064	1824	1 1-8	102	118	203

15-16	122	142	243	1 15-16	59	69	118
1	114	133	228	2	57	67	114

An important condition, that has material bearing upon the service given by twist drills, is that they may be driven at the best speed for cutting different substances. The softer the metal the faster the drill can be revolved, and the larger the diameter of the tool the slower its speed. Cast iron can be drilled faster than steel, and brass faster than either of the harder metals.

Treating Sulphated Plates—If, on test, the efficiency of a storage battery cell sinks to 50 per cent., or lower, the plates should be removed and washed thoroughly with distilled water. They are then placed in a cell containing a two to five per cent. solution of caustic soda in water, and the charging current sent through the cell in the usual way. If the sulphate on the positive plate does not disappear during the time of the ordinary charge, and the solution gives an acid reaction with litmus paper, more caustic soda must be added to the solution, and the charging continued until the plate has the usual chocolate appearance. The plates should then be removed from the soda solution, well washed, replaced in the sulphuric acid solution, and the charging continued until gassing begins. Many cells have had their efficiencies raised from 25 to 75 per cent. by six hours' charge, and many electricians believe that any plate which will hold together will well repay treatment by this method.

Extemporized Tube Protector—A medical man on an important call had a tire burst when several miles from home, and only had a spare inner tube, no outer casing or sleeve. Knowing that it was useless to put the tube in the shoe that had a 2.5 inch burst, he was rather nonplussed, but in looking over the tool kit he noticed that the roll in which the tools were carried was of heavy canvas. This was cut and a large piece of the flap was used between the inner tube and the shoe at the damaged portion, and the run to the patient's home was made without trouble. It is well to note that an ordinary dusting or polishing cloth, or a piece of chamois skin could have been used for the same purpose in an emergency.

Annealing Small Steel Pieces—To anneal small tools or pieces of steel heat up slowly to a red, and then take two pine boards and lay the hot steel between them, and screw them in a vise. As the steel is hot it sinks into the pieces of wood and is firmly enclosed in an almost air tight charcoal bed. When taken out after cooling it will be found to be very soft. This operation can be repeated if necessary. The boards prevent the steel from becoming cooled off too quickly, especially if the pieces are small.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS

The following companies have been incorporated recently to deal in motor cars, accessories, etc.:

Wachusett Cab & Automobile Company, Kittery, Me.; capital, $5000; incorporators, Horace Mitchell, C. E. Smothers, M. G. Mitchell.

The Motor Cab Company of Boston, Boston, Mass.; capital, $1000; incorporators, Otto E. Lawler, Leo J. Dunne, Harold D. Cushman.

The University Garage, Boston, Mass.; capital, $2000; incorporators, Newton A. DeWitt, Charles A. McLean, Thomas D. Cahill.

The D. B. Gray Engineering Company, Amesbury, Mass.; capital, $50,000; incorporators, Robert H. Hills, William E. Biddle, Budd H. Gray.

The Fothergill Motor Company, Boston; capital, $100,000; incorporators, Rufus B. Skinner, A. Chesley York, Arthur L. Thomas, Edith F. Gardner.

The Macker Motor Company, Worcester, Mass.; capital, $16,000; incorporators, Melvin A. Macker, Louis E. Bragg, Robert S. Smith.

Van Nuys Auto Garage, Los Angeles, Cal.; capital, $10,000; incorporators, F. R. Cyriacks, Fred S. Desiter, M. C. Frantz, T. K. Kase, L. E. Durrow.

The Plaquemine Motor Car Company, Plaquemine, La.; capital, $10,000; president, Dr. W. A. Holloway; vice president, Henry Nadler; secretary and treasurer, E. B. Schwing.

Broad Street Garage, Richmond, Va.; capital, $5000; president, A. Zachary; vice president, O. B. White; secretary, C. Stokes.

Marathon Car Company, Greenville, S. C.; capital, $15,000; president and treasurer, C. W. Ellis; secretary, H. D. Caldwell.

Pittsfield Auto Garage Company, Pittsfield, Mass.; capital, $3000; incorporators, Mary I. Mills, Arthur A. Mills, Arthur J. Mills.

Pullman Automobile Company, Philadelphia; capital, $25,000; treasurer, Orland M. Parke, 5347 Wynnefield avenue.

Pierce-Arrow Sales Company of Buffalo, Buffalo, N. Y.; capital, $75,000; incorporators, F. B. Schanne, F. M. Livingston, J. C. Williams.

Herkimer Garage Company, Buffalo, N. Y.; capital, $10,000; incorporators, Rowland J. Conover, Louis F. Jillson, Robert E. Conover.

Buffalo Tire Company, Buffalo, N. Y.; capital, $500; incorporators, Alfred C. Bidwell, William Preiss, Charles H. Bowe.

The Motor 'Bus Company, Chicago; capital, $50,000; incorporators, Clarence E. Morris, Frank Page and others.

The Blair-James Auto Company, Ogden, Utah; capital, $25,000; president, Joseph S. Campbell; vice president, M. W. Kimball; secretary, J. Parker Blair; S. H. Blair, L. H. Blair, H. C. Blair, Jr.

Grassfield Automobile Company of St. Joseph, St. Joseph, Mo.; capital, $2000; incorporators, E. A. Grassfield, George Vetuske, F. E. Frank.

The Dubuque Rambler & Auto Supply Company, Dubuque, Ia.; capital, $10,000; incorporators, Archy Frater, E. J. Schreck, B. M. Fitzgerald, William E. Ellwanger, William M. Bergener.

Great Western Motor Car Company, Los Angeles, Cal.; capital, $5000; incorporators, Le Roy Robinson, J. F. Huber, O. H. Robinson.

M. & P. Electric Vehicle Company, Detroit; capital, $10,000; incorporators, Myron C. Messiman, Burton Grandy.

Lenox Motor Car Company, Newark, N. J.; capital, $25,000; incorporators, L. Lippman, J. M. Shreffler, M. Lippman, C. Shreffler.

Harder Auto Truck Company, Chicago; capital, $100,000; incorporators, J. M. Johnston, H. P. Chandler, E. Cornwall.

Oldsmobile Company of Texas, Dallas, Tex.; capital, $10,000; incorporators, Clinton C. Clark, Rhodes S. Baker, Wendel Spence.

Wishart-Dayton Auto Truck Company of New York, New York City; capital, $25,000; incorporators, R. A. Inch, S. E. Wishart, Jr., J. B. Smith.

Knight Garage, New Haven, Conn.; capital, $15,000; incorporators, Harry T. Hotchkiss, George E. Tester, Pierrepont B. Foster.

Windsor Automobile Company, Windsor, Vt.; capital, $2000; incorporators, F. L. Cabot, Willard D. Cabot, Jessica White Cabot, Frank B. Tracy, J. H. Kinney.

The Milwaukee Auto Specialty Company, Milwaukee, Wis.; capital, $75,000.

Cosmopolitan Motor Company, New York City; capital, $10,000; incorporators, John Devine and John Kirby, 41 Wall street; Albert G. Armento.

Butler County Auto Company, Butler, Penn.; capital, $10,000; incorporators, John Yourkins, J. N. Patterson, A. C. Hileman, G. A. Evans, W. J. Rattigan, Ralph Gregg, J. L. Holben, B. L. Barnhart, A. E. Butler.

General Auto & Repair Company, Chicago, Ill.; capital, $25,000; incorporators, W. R. Potter, G. H. Davis, Jr., F. H. T. Potter.

Motor Vehicle & Marine Construction Company, Sewaren, N. J.; capital, $15,000; incorporators, Henry E. Acker, Tottenville, N. Y.; Albert B. Boynton, William C. Muir, Sewaren.

Central Auto Supply Company, Indiana Harbor, Ind.; capital, $600; directors, C. C. Robinson, F. E. Stephens, B. S. Gardner.

Sky-Pilot Motor Company, Los Angeles, Cal.; capital, $100,000; directors, E. T. Banning, C. T. Sheldon, George Bentley, E. M. Fisk, S. W. Odell.

G. E. & H. J. Habich Company, Boston, Mass.; capital, $25,000; incorporators, Henry J. Habich, G. E. Habich, George G. Taylor.

Acme Motor Car Company, Worcester, Mass.; capital, $40,000; incorporators, William Vincent, Albert D. Watson, William C. Foley.

Pyramid Automobile Company, New Haven, Conn.; capital, $5000; president, Walter H. Goodrich; secretary and treasurer, Henry P. Johnson.

Meteor Automobile Company, Mt. Vernon, N. Y.; capital, $50,000; incorporators, Frank A. Kateley, 11 Wallace avenue; Albert F. Goscheldt, 1554 Cottage avenue; John Emmeluth, 148 South First avenue.

Sunset Automobile Corporation, Los Angeles, Cal.; capital, $50,000; directors, H. A. Perkins, Herbert Howard, C. R. Clarke, Fred Myers, L. M. Fall.

Reynolds Motor Car Company, Norwalk, Conn.; capital, $4000; incorporators, Frank Reynolds, William L. Olsen, Grale Olsen.

Indiana Motor Car Company, Dallas, Tex.; capital, $10,000.

Belmont Auto Company, Shelbyville, Tenn.; capital, $5000; incorporators, F. N. Stower, W. A. Frost, H. W. Woolsey, John D. Hutton.

Virginia Automobile Garage & Repair Corporation, Norfolk, Va.; capital, $10,000; president, H. L. Page; vice president, A. M. Bopp; secretary and treasurer, P. A. Page.

Oskaloosa Garage Company, Oskaloosa, Ia.; capital, $10,000; president, D. P. McClure; vice president, C. W. Payne; secretary, A. O. Watland; treasurer, E. P. McClure.

International Motor Service Association, 25 Broad street, New York City; capital, $100,000; incorporators, William H. Brearley, Walter W. Friend, Irene A. Mouses.

Finlay Auto Company, Brooklyn, N. Y.; capital, $10,000; directors, William Finlay, Joseph Scholl, Ernest Finlay.

Bradford Auto Exchange, Bradford, Penn.; capital, $30,000; incorporators, F. H. Reed, L. I. Holmes, F. H. Leogan, S. L. Libbitts, F. L. Gallup.

Asheboro Motor Car Company, Asheboro, N. C.; capital, $5000; incorporators, M. L. Davis, C. E. Davis, C. Rush, I. N. Cox.

Etheredge Motor Company, Columbia, S. C.; capital, $10,000; president, E. J. Etheredge; vice president and manager, C. L. Etheredge; secretary and treasurer, Robert L. Merrill.

Greensboro Motor Car Company, Greensboro, N. C.; capital, $25,000; incorporators, H. M. Chamblee, W. M. Fowler, W. J. Sherrod.

Teven Garage Company, 148 West 118th street, New York City; capital, $10,000; incorporators, Joseph C. Graveur, Martha Graveur, Rosa Teven.

G. & S. Accessory Company, 220 West 97th street, New York City; capital, $100,000; incorporators, Frank D. Glover, John G. Stuart, John Z. Lowe, Jr.

Portsmouth Automobile & Machine Company, Portsmouth, O.; capital, $10,000; incorporators, Lincoln Poole, Walter O. Ruhlman, Roy A. Oakes, Filmore Musser, Edward C. Riegel.

Perry Auto Company, Taunton, Mass.; capital, $3000; incorporators, Frank W. Perry, James B. Wetherell, Homer L. Land.

Corson Auto Company, Springfield, Mass.; capital, $15,000; incorporators, Harold E. Corson, Frank H. Chapman, Waldo R. Forrister, Harry K. Smith.

Hamlin-Foster Auto Company, Portland, Me.; capital,

$100,000; incorporators, Arthur D. Hamlin, James L. Foster, George W. Merrow.

New England Wells-Block Tire Company, New Haven, Conn.; capital, $16,000; president, Frederick W. Wells; secretary and treasurer, Arthur C. Veith.

Vera Motor Car Company, Boston, Mass., and Providence, R. I.; capital, $60,000; incorporators, Edward E. Clark, George M. Polland, Mary A. Sweeney.

Bedford-Bergen Auto Exchange, Brooklyn, N. Y.; capital, $25,000; incorporators, M. Keve, B. Brown, Brooklyn; C. Goldstein, New York City.

Pathfinder Motor Company, Los Angeles, Cal.; capital, $50,000; incorporators, A. J. Hawkins, D. J. Gonver, I. N. Johnson.

Shaw-Lundin Auto Company, Kittery, Me.; capital, $10,000; president, Burton W. Shaw, Newton Centre, Mass.; treasurer and clerk, Horace Mitchell, Kittery.

Francis Motor Sales Company, Jefferson, N. Y.; capital, $5000; directors, Guy M. Francis, Worcester, N. Y.; Richtmyer Hubbell, Charles E. Nichols, Jefferson.

Fredericksburg Motor Company, Inc., Fredericksburg, Va.; capital, $10,000; president, L. R. Colbert, Massaponax, Va.; vice president, Alvin T. Embrey, Fredricksburg; secretary and treasurer, H. C. Biscoe, Fredericksburg.

Auto Tire & Cycle Company, Birmingham, Ala.; capital, $2000; president, Reese Stansel; secretary and treasurer, W. R. Grimes.

Consolidated Auto Company, Columbia, S. C.; capital, $5000; incorporators, J. B. Roddey, W. W. Pearce, John J. Cain, J. P. Matthews.

Automobile Sundries Company, 114 East 23rd street, New York City; capital, $10,000; incorporators, George F. Merritt, John E. Waltz, Theodore M. Crisp.

Auto Accessories Manufacturing Company, Cincinnati, O.; capital, $15,000; incorporators, S. C. Roettinger, A. L. Habekotte, W. A. Paxton, Henry E. Beebe, William Stichtonoth.

Little Giant Motor Car Company, Camden, N. J.; capital, $125,000; incorporators, W. C. Davis, D. Cooney, A. H. Holl, A. E. Simmons.

Amalgamated Motors Company, Los Angeles, Cal.; capital, $500,000; directors, C. B. Croner, C. J. Schroeder, J. L. Kirkman.

American Silent Motors Company, Los Angeles, Cal.; capital, $2,000,000; incorporators, Benjamin Waterfall, R. J. Connors, Ernest Kouwen-Hoven.

Buffalo Motor Vehicle Service Company, Buffalo, N. Y.; capital, $100,000; incorporators, W. R. Huntley, J. H. Vail, C. H. Huntley.

Mogul Motor Truck Company, Chicago; capital, $125,000; incorporators, G. C. Griffiths, J. S. James, F. Dawson.

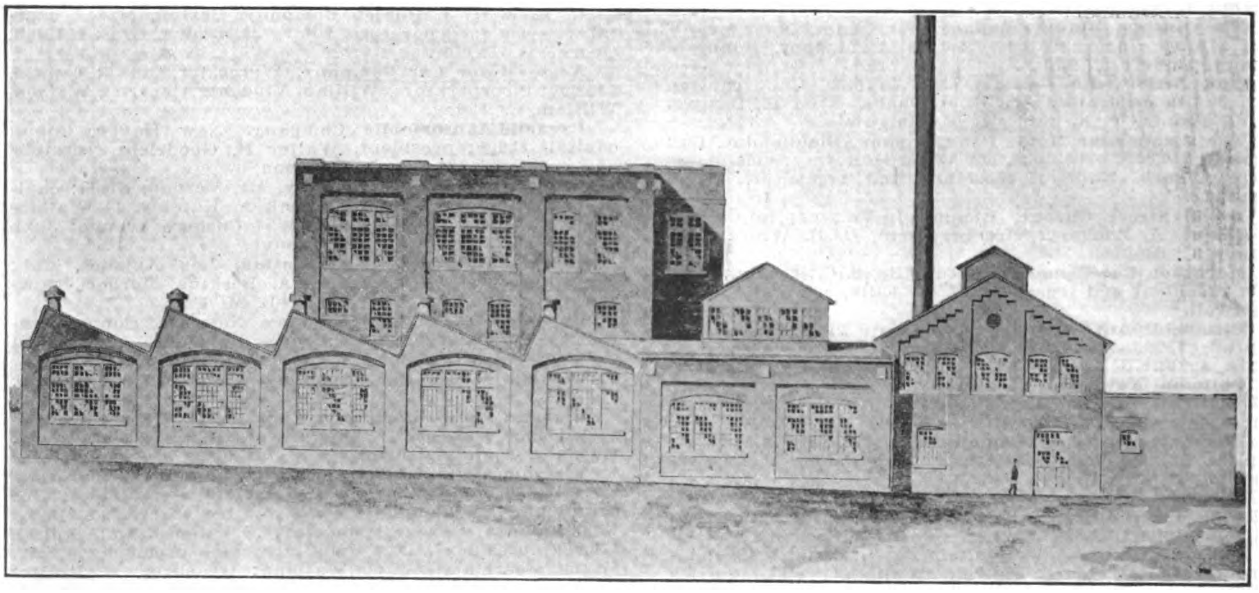
Beverly Automobile Company, Los Angeles, Cal.; capital, $10,000; incorporators, John Wright, Fred L. Moses, Charles H. Pool.

The Co-Operative Automobile Supply Company, Indianapolis, Ind.; capital, $25,000; incorporators, B. H. Ripenbark, J. C. Curtis, J. F. Boessinger.

Merchants' Motor Delivery Company, Fort Wayne, Ind.; capital, $25,000; incorporators, A. W. Harris, William Hahn, A. H. Fernwalt.

Davenport Auto Company, Davenport, La.; capital, $10,000; president, August A. Lebermann; secretary and treasurer, Charles A. Frey.

Prudence Motor Truck Company, Brooklyn, N. Y.; capital, $100,000; incorporators, Herbert Cooper, Arthur Cooper, Alfred G. Yeomans, Charles J. Diegert, Franklin C. Haven.



Front Elevation of the New Factory Building Under Process of Erection for the Knight Tire & Rubber Company, Canton, O.

WITH THE MANUFACTURER

A. D. McLachlan, formerly with the Royal Tourist Motor Car Company, has become general sales manager for the Sanford-Herbert Company, Syracuse, N. Y., maker of the Sanbert truck. Mr. McLachlan was with the Cleveland concern for 10 years.

J. I. Handley, president of the American Motors Company, Indianapolis, Ind., maker of American cars, has returned from a trip to Manitoba, Can., and including some of the larger centres in the West, South and East. He reports the automobile trade to be in promising condition throughout the entire country.

The Auto-Pump Company of Springville, N. Y., has filed incorporation papers, with a capital of $6000. The incorporators are: Ralph B. Waite, Bertha C. McInerney and Ira W. Smith.

The Miles Motor Tire Spring Company has been organized with capital of $200,000 and will erect a plant at Braddock, Penn. The incorporators are: Charles W. Dressler, Thomas C. Aten, Charles L. Balyser, Zeneb A. Delwarts, Braddock; Frederick Miles, Wilkingsburg, Penn., and M. R. Myers, Untindon, Penn.

The Suburban Truck Company of Camden, N. J., has been incorporated for the purpose of manufacturing a new line of commercial vehicles. The capital is $10,000 and the incorporators: J. Edward Fagan, George H. Jacobs, Walter B. Carroll.

The Krupp Motors Company has been chartered to manufacture motor vehicles and parts at Pittsburg, Penn. Those interested in the organization are: D. Morgan, G. H. Anderson and James McMorran. The capital is $250,000.

The International Accessories Company, Detroit, Mich., announces that it is ready to place the Speedo carburetor, which was given its first trials in a recent race meet on the Pacific Coast, on the market in large numbers. Already some 3000 of these instruments have been manufactured, and the product will be distributed by the Fulton-Grubb Company of Detroit.

The United States Tire Company, New York City, is issuing a 10-page booklet entitled "The Tale of a Tortured Tire," which describes in an interesting manner the hardships of a shoe in the hands of an inexperienced chauffeur. The abuses cases are subjected to are brought out in the illustrations.

The Knight Tire & Rubber Company, Canton, O., is progressing rapidly with the construction of its factory in that city, an illustration of which is presented herewith. Every effort will be made to have the structure ready for occupancy shortly after Jan. 1.

The Remy Electric Company, Anderson, Ind., maker of Remy magnetos for ignition and lighting service, announces that the Kansas City branch has been removed from 416 East 15th street to 509 on the same thoroughfare. The change was made to secure more commodious quarters and enable the handling of rapidly increasing business in that territory.

S. W. Seeley, well known in the trade as editor of the parts and accessories department of the Cycle & Automobile Trade Journal, Philadelphia, Penn., has resigned to join the editorial staff of the Keystone Publishing Company.

The Moon Motor Car Company, St. Louis, Mo., has found it necessary to add another structure to its already extensive plant. This will increase the capacity about 25 per cent., and enable much quicker delivery of cars.

The Hyatt Roller Bearing Company, Newark, N. J., has removed its Detroit branch from the Ford building to the second floor of the structure at 754-756 Woodward avenue, where it will have ample facilities to take care of its rapidly increasing business.

The Ohio Motor Car Company, Cincinnati, O., maker of Ohio gasoline cars, announces the appointment of the following agents: W. L. Penny, Richmond, Va.; Central Garage & Machine Shop, Calgary, Alta.; M. R. Cheesman Company, Salt Lake City, Utah.

The Firestone Tire & Rubber Company, Akron, O., is issuing a circular to the trade, calling attention to its non-skid Firestone tires.

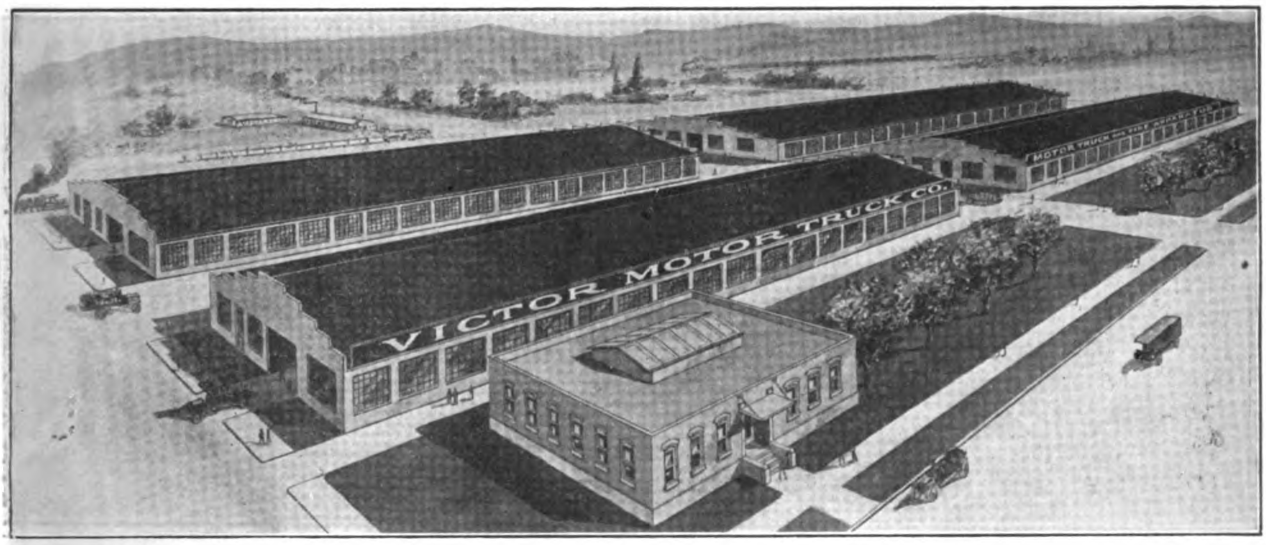
The Knox Automobile Company, Springfield, Mass., maker of Knox cars, is issuing a neat little booklet, entitled "New England Quality," which affords opportunity to call attention to the merits of the concern's product.

W. F. Steel has resigned his position with the Lexington Motor Car Company, Connersville, Ind., but has not announced his future plans.

E. D. Whorley, formerly branch manager of the B. F. Goodrich Company's office in Dallas, Tex., has accepted a position with the Motz Tire & Rubber Company, Akron, O.

The Newark Auto Accessory Company, Newark, N. J., has been incorporated by P. Laible, H. Eisenlohr, S. J. McDonald and G. H. Hupp for the production of accessories and fittings for automobiles. The capital is $100,000.

The Havers Motor Car Company, Port Huron, Mich., announces it has awarded contracts amounting to $340,000 for the construction of motors to be used in Havers six-cylinder cars during the 1912 season.



Architect's Plan of New Plant to Be Erected by the Victor Motor Truck Company of Buffalo N. Y.—One of the Buildings Is Already Completed.

Andy Auble is president, Charles Steels superintendent, and Cecil Walker sales manager of a new concern in Akron, O., organized for the manufacture of a new self-starting device. The company is capitalized for $50,000 and expects to place its product on the market in the near future.

The American Locomotive Company, New York City, maker of Alco cars, has acquired a large piece of property at Long Island City, N. Y., where it will erect a service department.

The International Metal Polish Company, Indianapolis, Ind., maker of Blue Ribbon polishes and other preparations, will erect a new plant 100 by 80 feet on a site recently purchased in that city.

The Willys-Overland Company, Toledo, O., maker of Overland pleasure and commercial vehicles, has been engaged during the past summer in making extensive alterations and additions to the floor space at the factory, bringing it to a total of 60 acres. In the background of the accompanying illustration is shown the large new body building, trimming and paint departments, the structure being four stories high and 300 by 400 feet in dimensions. Other buildings include a new power house, which adds 300 horsepower; a dry kiln with capacity of 1,250,000 feet, and an enamelling plant.

Allerton S. Cushman, Ph.D., formerly assistant director of the United States office of public roads, is now director of the Institute of Industrial Research at 19th and B streets, N. W., Washington, D. C. He is assisted by Prevost Hubbard, consulting chemist, in the examination and testing of road building and protecting materials.

Roy Watts, formerly power apparatus manager for the Western Electric Company, has joined the forces of the Remy Electric Company, Anderson, Ind., as a special travelling sales representative.

The Little Motor Car Company, Flint, Mich., has been incorporated with capital of $1,200,000. The concern will take over the plant of the Flint Wagon Works, which has a capacity of 15,000 cars a year. Among the incorporators appear the names of the following: W. H. Little, Detroit, formerly factory manager of the Buick Motor Company; C. M. Begole, president, and W. S. Bellenger, secretary-treasurer of the Flint Wagon Works.

The Spring Hub Automobile Wheel Company, Cincinnati, O., has been incorporated with capital of $10,000. The new concern will produce a spring hub which is expected to do away with the use of pneumatic tires. No definite arrangements have been perfected as to the location of the plant, although the matter will be taken up at a meeting to be held in the near future.

The National Spring Tire Company has been incorporated in Chicago, Ill., for the manufacture of automobile accessories, etc. The incorporators are: C. J. Sigmann, Jr., L. Valence and C. H. Jackson. The capital is $125,000.

The Metz Company, Waltham, Mass., maker of Metz pleasure and commercial cars, has decided to increase its factory floor space by the erection of a new building.

C. F. Splitdorf, New York City, maker of Splitdorf magnetos, announces that owing to lack of facilities for handling the tremendous volume of business on the Pacific Coast, the San Francisco, Cal., branch has been removed to 430-436 Van Ness avenue. P. E. Kempton will be in charge.

The U. S. Industrial Alcohol Company, 100 William street, New York City, is issuing a neat booklet describing Pyro, a non-freezing alcohol solution marketed by that concern. The composition and effects of different anti-freezing mixtures are dealt with and the advantages of the Pyro alcohol described. A chart and tables are included, showing freezing temperature of solutions of alcohol and water.

Herman of Chicago is the author of a booklet entitled "Ten Tests of an Automobile," which should be helpful to those considering the purchase of a motor car.

The Firestone Tire & Rubber Company, Akron, O., maker of Firestone tires and rims, has experienced a remarkable growth since 1902, when the building shown in the upper left hand corner of the accompanying illustration was erected. That in the upper right hand corner was constructed in 1910, and converted into an exclusive rim plant this year. The main picture shows a general view of the present tire factory.

The Victor Motor Truck Company, Buffalo, N. Y., maker of commercial vehicles ranging from 1500 pounds to 10 tons capacity, is building a new factory, this step being decided upon at a meeting of the board of directors. The present facilities are inadequate for the increasing business. In the accompanying illustration is shown the architect's drawing of the new plant, one building of which is already completed.

N. Lazarnick, automobile photographer, has opened a branch office and studio at 509 South Dearborn street, Chicago. R. V. Cirnveille is manager.

The Henderson Motor Sales Company, Indianapolis, Ind., announces the appointment of the following new agencies, changes, etc., for the Cole line: J. P. McCullom, Carthage, Ill.; Dr. A. J. Thornber, Burlington, Vt.; W. T. Hutcheson, Hempstead, L. I.; Winthrop Pier, El Centro, Cal.; Crist Motor Sales Company, Toledo, O.; Fred and William Chadsey, Cherokee, Kan.; Douglas & Willett,, Harrisonville, Mo.; Anderson Motor Company, Fon

Du Lac, Wis.; Stahl & Stone, Topeka, Kan.; Spencer Auto Company, Spencer, Ia., branch of Cole Motor Company of Des Moines; Breen Motor Company, Winnipeg, Can., removed to 151 Portage avenue; Cole Motor Company, Wichita, Kan., to new quarters at First and Water streets; Penn Auto Company, Scranton, Penn., changed to that of Scranton Auto Company; Marcus R. Thackery, Sterling, Ill., moved to 601 West Third street; Jay E. Morehouse, Milwaukee, Wis., new salesroom at 86 Farwell avenue; Moscow Automobile Company, Moscow, Ida.; C. F. Cole, Denver, Col.; Twitchell Motor Car Company, 15th and Washington streets, Portland, Ore.; Kewanee Garage, Kewanee, Ill.; R. Bruce Carson, Hagerstown, Md.; C. F. Dupree, Atlanta, Ga.

The Baker-Brewer Auto Company, Indianapolis, Ind., agent for the Baker electrics, made by the Baker Motor Vehicle Company, Cleveland, O., has obtained quarters at 426 North Capital avenue.

The Bosch Magneto Company of New York City calls attention to the fact that at the Olympia show, held at London, England, recently, of the 599 magnetos displayed on cars, 488 were Bosch, 81 per cent. of the total. The balance of 19 per cent. was divided among 10 other manufacturers.

Maj. L. M. Fuller and E. H. Sohner of the Velie Motor Vehicle Company, Moline, Ill., were in Chicago recently purchasing machinery equipment for plant No. 2. At this factory motors for both the pleasure and commercial vehicles will be constructed, also the new Velie Junior automobile.

The American Locomotive Company, New York City, has appointed Robert F. Russell assistant engineer of its automobile department. He was identified with the Simplex company for over seven years, having charge of the designing department. In his new capacity he will be associated with Montague H. Roberts, chief engineer, in matters pertaining to Alco pleasure and commercial cars.

Alden L. McMurtry, one of the engineers connected with the Gray & Davis dynamo factory, Boston, is touring Europe with the object of investigating every well known lighting system abroad. He was a member of the Society of Automobile Engineers party which visited England recently.

The Havers Motor Car Company, Port Huron, Mich., announces an increase of capital stock from $60,000 to $200,000. Sanderson & Burkhardt of Buffalo, N. Y., and the Havers Sales Company of Milwaukee, Wis., have been appointed agents.

John Wells, formerly manager of the tire department of the Canadian Rubber Company, Montreal, Can., has resigned to become sales manager for P. Gadbois Company, eastern representative of Cole and E-M-F cars.

Fred S. Howard, manager of the Franklin Square Garage, Worcester, Mass., has plans underway for equipping a new machine shop for the purpose of producing any part needed in the repair of automobiles. This will necessitate the addition of three new men to the present garage force.

Harrison H. Hanley of North Adams, Mass., and Claude Bradford of New Haven, Conn., have purchased the Dill garage on Crown street in the latter city.

E. O. Hoopengarner, chairman of the committee appointed by the Motor Truck Club of New York City to see what could be done toward the establishment of a commercial vehicle garage in the lower part of the city, has secured a promising site on West Houston street.

The Lagerquist Carriage & Auto Company of Des Moines, Ia., has purchased the business of the Sunderlin & Simpson Auto Company of that city, and will conduct both lines, continuing the manufacture of Hawkeye trucks in addition to the operation of a garage.

GARAGE & DEALER

"Doc" Green, formerly sales manager of the Cadillac agency in Los Angeles, Cal., has taken a similar position with the Grundy Motor Sales Company of that city. He will look after the sale of the Cole and Paige-Detroit lines. A. M. Young, who has been sales manager of the Thomas and American cars, handled by the same concern, will retain the same position as heretofore.

The Ernest P. Chesbro Automobile Company, Hartford, Conn., which is building a brick repair shop, has leased the property to Fred M. Little and George Siegrist of that city. The former has been conducting a repair shop while the latter was head mechanic for the Chesbro company.

The Newton-Humphreyville Company, Newark, N. J., has taken over the Pierce-Arrow building at 124 Washington street.

The McManaway Garage has leased quarters in the Wadsworth building, North Tryon street, Charlotte, N. C., and will remodel the structure. The concern is agent for the Marion line.

The Johnson Garage, Forest street, South Norwalk, Conn., has been remodelled. The ground floor will be utilized for storage and the second devoted to the repair shop.

The Acme Motor Company, Worcester, Mass., organized recently to continue the business of D. A. Baldwin, has completed negotiations for the purchase of a four-story building located at 22 Commercial street.

The Gallagher-Tompkins Company, 1876 Broadway, New York City, has taken the agency for Manhattan and Long Island for the Selden line, made by the Selden Motor Vehicle Company of Rochester, N. Y. The former concern is a new addition to automobile row and comprises R. W. Gallagher and F. Bianchi Tompkins, both well known to the automobile trade.

The Hampden Tire & Rubber Company, Holyoke, Mass., has purchased the Richard Riley Auto Company of that city. The new concern contemplates making extensive improvements.

The Macker-Tyler Company, Worcester, Mass., held its annual meeting recently and elected the following officers: President, O. P. Tyler; secretary and treasurer, G. F. Fuller; clerk, Jay Clark, Jr.

The Charleston Motor Sales Company, headed by William Burguson of Detroit, will open salesrooms in Charleston, S. C.

Charles F. Swartz, 4123 Olive street, St. Louis, Mo., has been appointed agent for the Velie line, manufactured by the Velie Motor Vehicle Company, Moline, Ill.

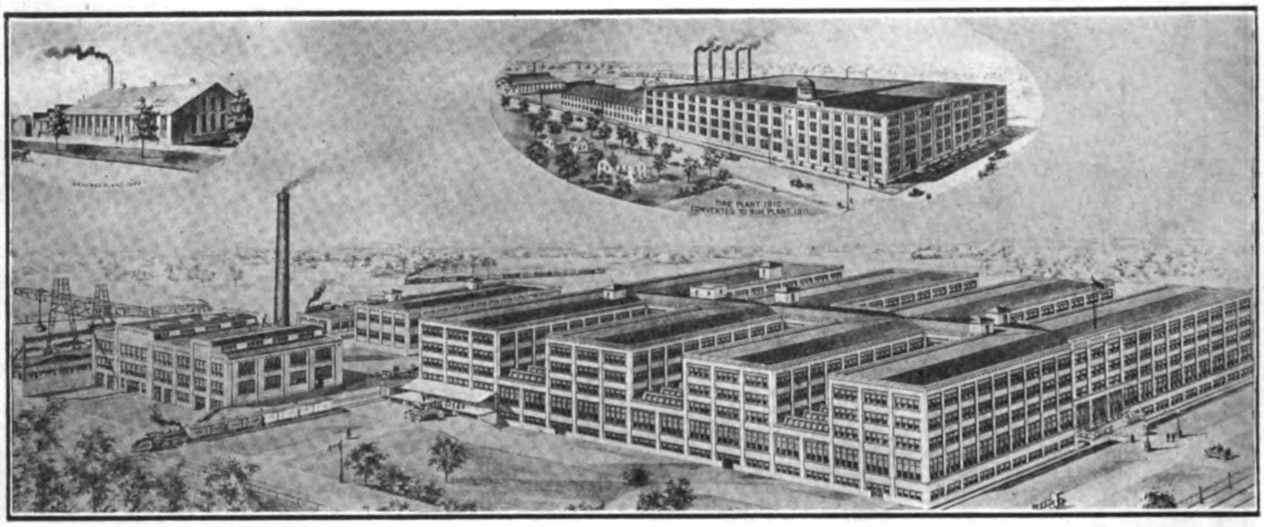
The Missouri State Automobile Directory and Guide for 1911 is now ready for distribution. The book contains road maps, etc.

The Matheson Automobile Company of Wilkesbarre, Penn., has leased the entire building constructed recently on Commonwealth avenue, Boston, and formerly occupied by the Dayton Motor Car Company.

The Auto Sales Company, 1121 Chestnut avenue, Cleveland, O., has taken the agency of the Buckeye truck.

Kirk & Co., New Haven, Conn., has awarded a contract for a new $40,000 garage to be built on Crown street. The building will be equipped with the most modern appliances for the care and maintenance of motor cars.

Peter Porter of Salem and Arthur C. Mayers of Lynn, Mass., have purchased a building on Manning street in



View of the Firestone Tire & Rubber Company's Buildings at Akron, O., Showing the Remarkable Growth of This Concern During the Past Nine Years.

the former city and will open a first class garage which will be known as the Manning Street Garage.

D. J. and W. T. Fox, Birmingham, La., have secured the agency for the Matheson line and will open a new garage at 321 South 20th street.

Volney S. Beardsley, president of the California Automobile Company, Los Angeles, Cal., will erect a garage which will have a frontage on Seventh street. The building will be divided so that the gasoline and electric departments will be entirely separate.

The W. L. Russell Company of Boston has taken the agency for the Haynes car, made by the Haynes Automobile Company, Kokomo, Ind.

The Electric Vehicle Club of Boston has formed a permanent organization. Day Baker, New England manager of the General Vehicle Company, has been elected president, and Leavitt L. Edgar of the Boston Edison Company, secretary.

H. W. Lowe, formerly with the Peerless Motor Car Company's factory at Cleveland, O., has joined the forces of the Fairfield Auto Company, New Orleans, La., as sales manager.

W. C. Poertner has leased a floor in the building opposite the Automobile Club of America on West 54th street, New York City, where he will conduct a maintenance department for National cars sold in that district. It is planned to fit up an entire automobile plant in miniature, and all used cars will be given a thorough overhaul in this shop before being placed upon the market.

The Capital Car Company has been organized in Wheeling, W. Va., for the purpose of representing the K-R-I-T cars, made by the K-R-I-T Motor Car Company, Detroit. It will be located at Chapline and 16th streets.

Charles Childs, George Childs and **William H. Boyington,** all of Pittsfield, Mass., have opened a shop for the vulcanizing and repair of automobile and motorcycle tires at 156 Union street in that city.

David J. Fox and William T. Fox have been appointed general southern selling agents for the Matheson cars, made by the Matheson Automobile Company, Wilkes-barre, Penn., with headquarters at Birmingham, Ala. Their territory will include the States of Alabama, Mississippi and eastern Tennessee.

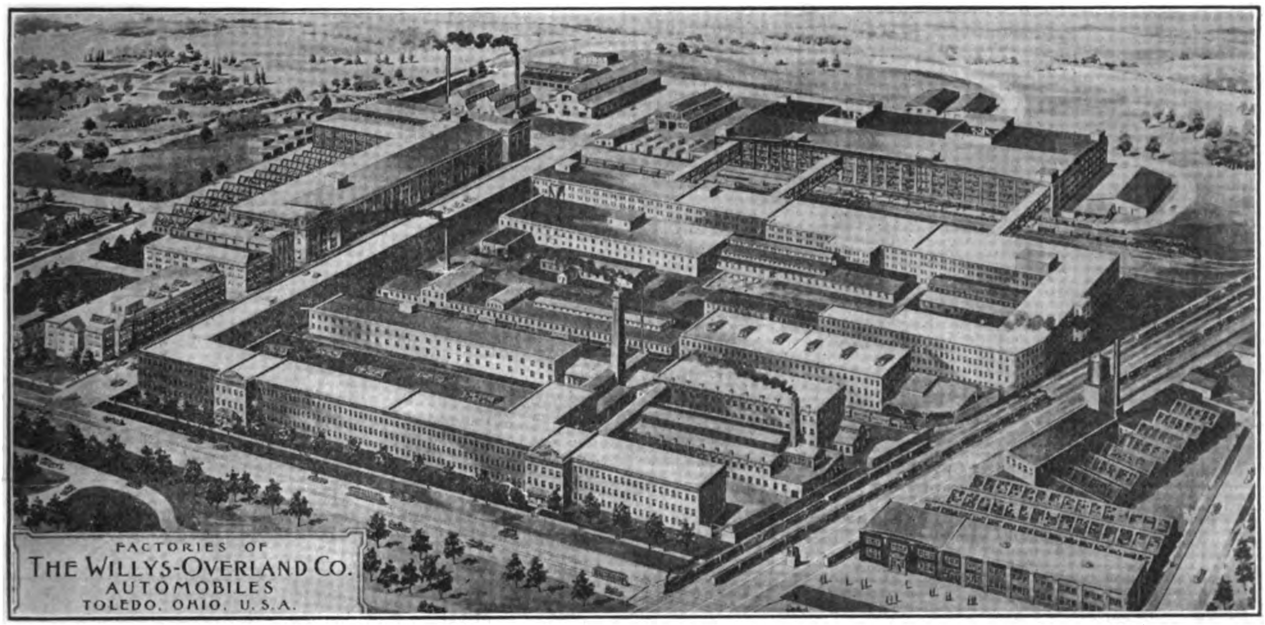
The Oneida Garage Company of 125 Park avenue, Utica, N. Y., is to erect a new building, which is to be the largest and most complete in the city. It is anticipated the new structure will be ready for occupancy soon after the first of the year.

Frank P. Day has been appointed manager of the new branch of the Locomobile Company of America, Bridgeport, Conn., in Atlanta, Ga.

Mohrig Bros. has removed to its new building on Golden Gate avenue, San Francisco, Cal., where it will have all the necessary facilities for carrying on a rapidly increasing business in the sale of automobiles, parts and accessories.

Albert J. Ditman, for the past eight years connected with the Studebaker Corporation, South Bend, Ind., has become a member of the Whiting Motor Company, New York City, agent for Cunningham and Mercer pleasure cars, and Sandusky trucks.

Harry Spencer is remodelling a building on Bridge street, South Hadley Falls, Mass., and will open a garage. He was formerly employed in Springfield as head mechanician.



FACTORIES OF
THE WILLYS-OVERLAND CO.
AUTOMOBILES
TOLEDO, OHIO, U.S.A.

General View of the Largely Increased Plant of the Willys-Overland Company in Toledo, O.

The Poertner Motor Company, New York City, has taken the agency for Herreshoff cars, made by the Herreshoff Motor Company, Detroit.

The Standard Tire & Rubber Company, 104-106 Portland street, Boston, Mass., is making extensive preparations for a largely increased business during 1912. Early in the month, Treasurer J. S. Waddell left on a trip to the Pacific Coast and Hawaiian Islands, and will establish a number of agencies for the firm's products. The name of the concern's uptown branch has been changed from Percy Ford Auto Supply Company to the Standard Auto Supply Company.

George Armstrong, representing Carlos Armstrong, E. Hijos, Plays-Ponce, Porto Rico, on a recent trip to New York City, arranged with the Colt-Stratton Company, eastern distributor for Cole cars, made by the Cole Motor Car Company, Indianapolis, Ind., to handle that product in Porto Rico.

The De Dion-Bouton Selling Branch, 1649 Broadway, New York City, American representative of the Etablissements de Dion-Bouton, France, maker of De Dion-Bouton cars, is issuing a splendidly illustrated catalogue of these machines.

C. H. Voegele, Mansfield, O., has closed a contract with the Velie Motor Vehicle Company's Chicago branch to represent this line of cars in his vicinity.

Studebaker agents of the East, comprising about 200 dealers of New York, New Jersey, Long Island and Connecticut, left New York City recently for a factory inspecion trip in a Flanders and E-M-F Pullman train over the West Shore road. The guests were conveyed from the metropolitan Studebaker branch at Columbus Circle to the ferry by E-M-F cars. In the accompanying illustration is shown the members of the party previous to the start.

C. M. Allen of New York City will succeed K. B. Harwood as manager of the Autocar Company's branch in that city, while the latter will take an exclusive agency for Autocars in Chicago and vicinity.

J. M. Quinby & Co., New York City, has opened a retail agency for Isotta-Fraschini cars at Broadway and 54th street, in that city.

Morton H. Luce, manager of the Velie Chicago branch, has placed Charles V. Severin, who has been connected with the industry for the past seven years, in charge of the Velie service department.

The Central Texas Automobile Company, Taylor, Tex., has filed a certificate of dissolution.

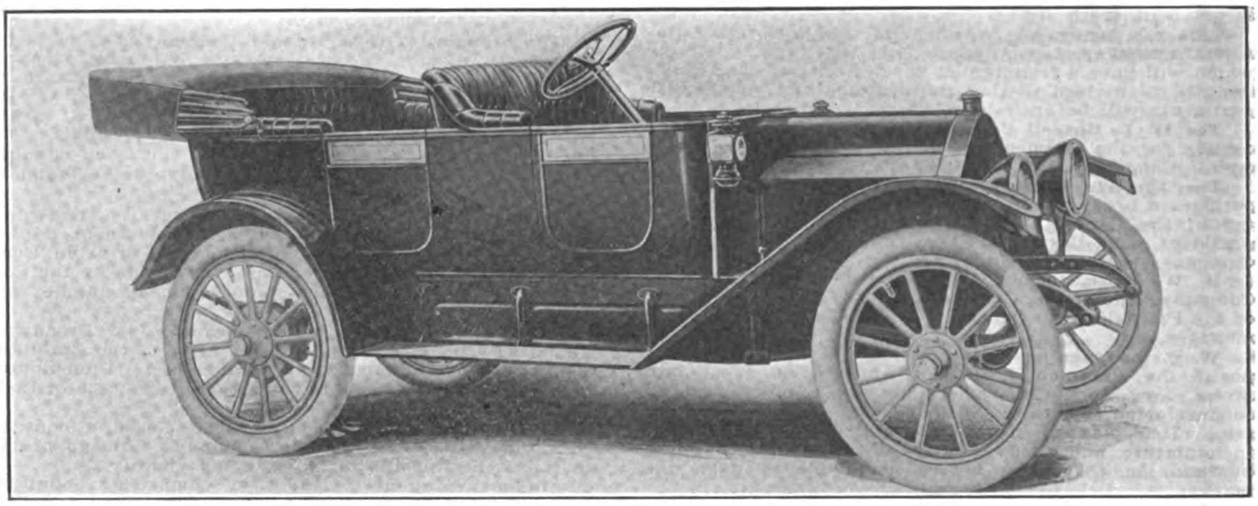
The Clark Motor Car Company, Louisville, Ky., has amended its articles of incorporation, providing for an increase of capital stock from $30,000 to $60,000.

Leslie B. Eaton is president and F. W. Pennebaker secretary of the new automobile company incorporated recently at 1136 West Third street, New York City. The new concern will handle the Marion line of cars.

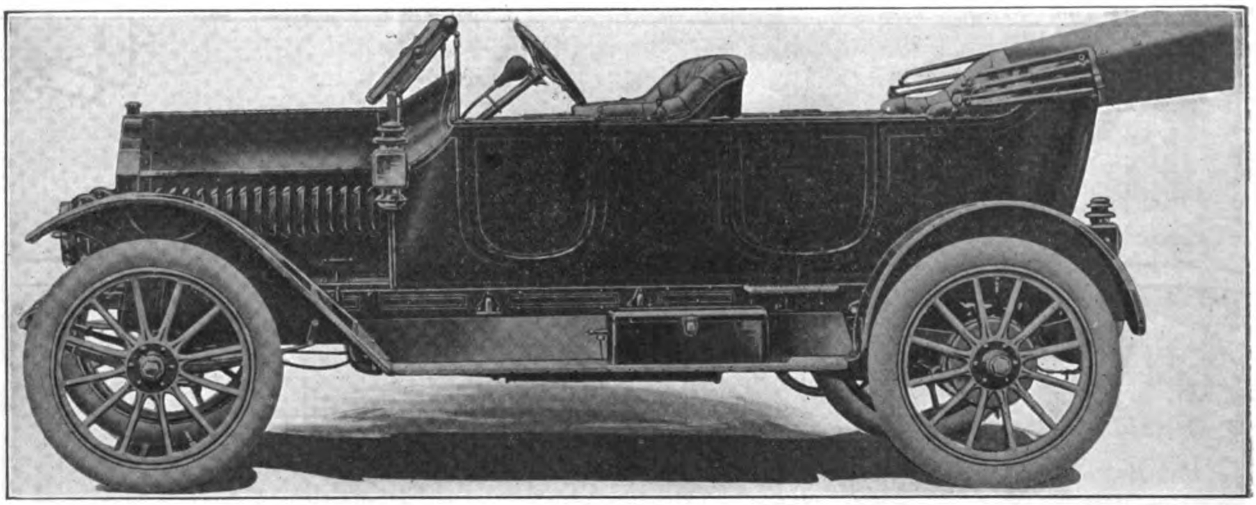
The La France Motor Car Company of Elmira, N. Y., announces that the name has been changed to the La France Garage Company and that the concern has been incorporated.

John E. Boyle, a well known druggist of Fairfield, Conn., will open a new garage in that place Nov. 15. He has leased a large building which is being altered.

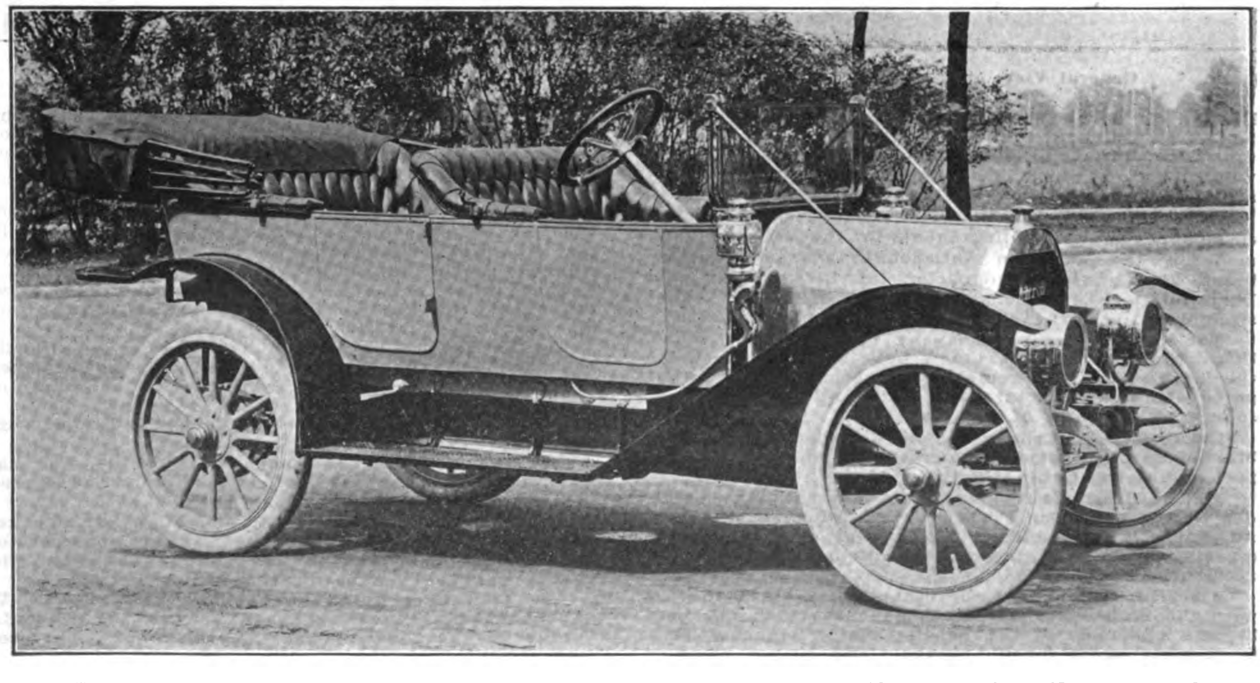
ATTRACTIVE LINES FOR LIVE AGENTS.



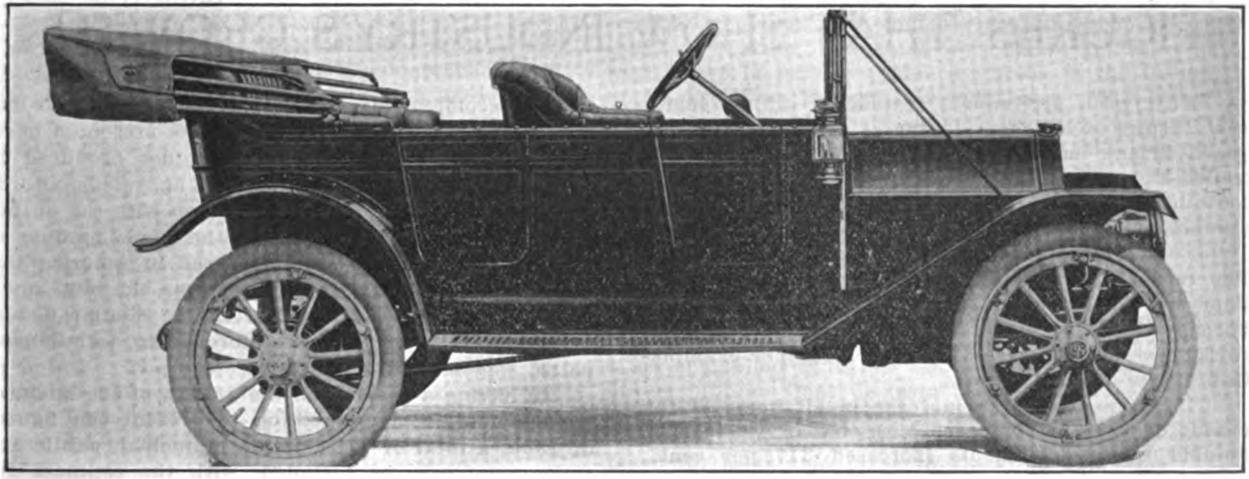
Touring Body Fitted with Detachable Fore Doors, an Especially Desirable Equipment for Great Western Cars, Made by the Great Western Automobile Company, Peru, Ind.



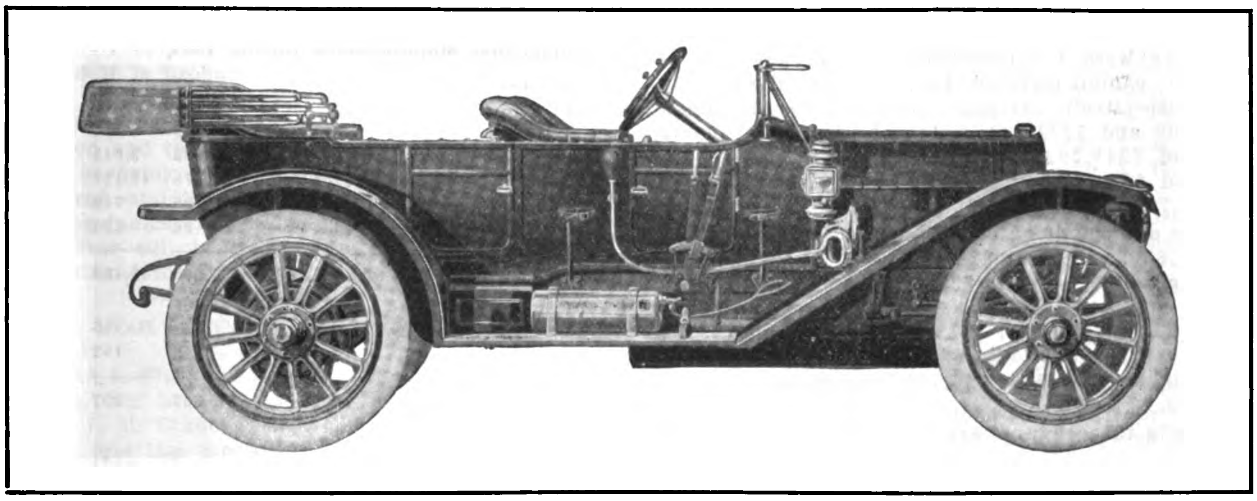
Special Four-Passenger Touring Car Body Known as 99B When Installed on a 40 Horsepower Friction Driven Lambert Chassis, Built by the Buckeye Manufacturing Company, Anderson, Ind.



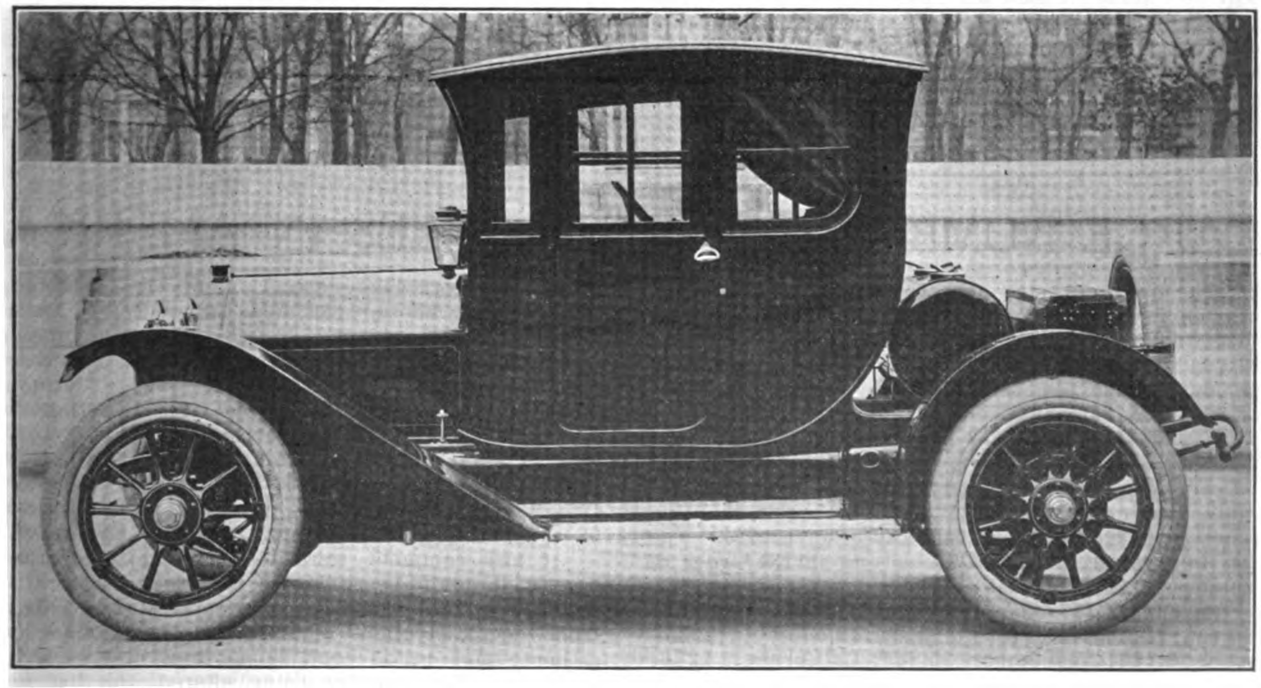
Fore Door Touring Body Designed for 1912 Equipment of Warren-Detroit Cars, Known as Model K-30, the Product of the Warren Motor Car Company, Detroit, Mich.



Model K, the Latest Production in the Way of Body Equipment Turned Out by the K-R-I-T Motor Car Company, Detroit, Mich.



"Thirty" Semi-Touring Model KisselKar, the Smallest of the Line of Machines Built by the Kissel Motor Car Company, Hartford, Wis.



Colonial Coupe Body, Which Is Especially Adapted for Winter Service, Fitted to Stutz Chassis by the Ideal Motor Car Company, Indianapolis, Ind.

FIGURES THAT SHOW INDUSTRY'S GROWTH.

A FURTHER preliminary statement of the general results of the 13th census of establishments engaged in the manufacture of automobiles, including bodies and parts, issued by Census Director Durand, contains summaries, which give in general figures, the number and value of machines by kind for 1904 and 1909, and the horsepower rating by classes for 1909. The report was prepared under the direction of William M. Steuart, chief statistician for manufactures, bureau of census. The figures are subject to such revision as may be necessary after a further examination of the original reports.

The summary shows increase in all items at the census of 1909 as compared with that of 1904. The number of establishments increased 317 per cent.; capital invested, 653 per cent.; gross value of products, 730; cost of materials, 901; value added by manufacture, 596; average number of wage earners employed, 528; amount paid in wages. 580; number of salaried officials and clerks, 682; amount paid in salaries, 654; miscellaneous expenses, 389; primary horsepower, 647.

There were 178 establishments in 1904 and 743 in 1909; capital invested, $23,084,000 and $173,837,000, respectively; average capital an establishment, $130,000 and $234,000; value of products, $30,034,000 and $249,202,000; salaries and wages, $8,416,000 and $58,173,000; average wage earners, 12,409 and 75,721.

The number of automobiles manufactured in 1904 was 22,830, valued at $24,630,400. Of these, 19,837 were gasoline, worth $20,440,100; 1425 electrics valued at $2,496,300, and 1568 steam at $1,688,000. In 1909, the total was 127,289, and the value, $165,115,100, divided as follows: Gasoline, 121,274, $155,068,100; electric, 3639, $6,564,500; steam, 2376, $3,482,500.

While these figures are practically two years old, they offer a satisfactory basis from which to compute the number of cars in actual use in America today. Reliable sources of information, although by no means more authentic than the government census report, fix the product of automobiles in 1910 at 145,000 and that for 1911 at 190,000, with a prediction that 1912 will see at least another 210,000 pleasure vehicles and 18,000 business wagons. Assuming that the rate of increase between 1904 and 1909 was more or less gradual and making due allowance for depreciation, a conservative estimate of the machines now in service would be not far from 525,000.

An accompanying table, issued by the census bureau in connection with the other data presented herein, sets forth the number of machines produced in 1909, classified by horsepower rating. This affords additional opportunity for comparison with the output for 1911. It will be noted that the whole number of taxicabs, for instance, manufactured in America two years ago was 1203. This is less than the total operated in New York City alone today. Similar deductions might be made with reference to ambulances, patrol wagons and other items.

As having a bearing on the growth of the business vehicle field, it is interesting to present the figures of 1909, a total of 4784, if the municipal, public and commercial cars be included, with the estimate for 1912, 18,000. The remarkable strides that have been made in this important branch of the automobile industry within the past two years have few parallels in the business history of the world.

LARGE NUMBER OF AUTOMOBILES IN AMERICA.

The question as to how many automobiles are in service in the United States is one which interests every motorist, as having a bearing upon the magnitude of the industry. Of course, any totalization is bound to be largely a matter of estimate, but one of the tire companies in Akron, O., has based its figures on the number of shoes sold during the past year, careful account having been kept of the owners of cars making purchases of this nature. This estimate places the total at 573,696, which is counting much more closely than from any other source. The list follows, according to states and in the order of number of cars in each:

New York, 70,560; Illinois, 52,038; Pennsylvania, 50,703; Ohio, 40,951; Michigan, 40,000; Massachusetts, 39,430; New Jersey, 35,800; California, 33,266; Indiana, 23,000; Iowa, 22,000; Minnesota, 19,561; Missouri, 16,000; Wisconsin, 11,412; Nebraska, 10,212; Connecticut, 9526; Kansas, 8000; Colorado, 7608; Georgia, 6411; Texas, 6200; Rhode Island, 5984; South Dakota, 5462; Washington, 5378; Maine, 4853; New Hampshire, 4324; Oregon, 4100; District of Columbia, 4100; West Virginia, 3575; Tennessee, 3516; Maryland, 3317; Virginia, 3299; Vermont, 3000; Kentucky, 2871; Florida, 1864; Oklahoma, 1786; Montana, 1641; Alabama, 1561; Utah, 1495; South Carolina, 1474; Louisiana, 1440; North Carolina, 1171; Delaware, 1000; Idaho, 924; North Dakota, 840; Arizona, 570; Wyoming, 562; Arkansas, 381; Mississippi, 250; Nevada, 199; New Mexico, 171.

If any comment were to be made upon these figures, it might be suggested that they seem rather under than over the number in some states, judging from the registrations reported. However, since one estimate may be as good as another, and each has some special reason for being offered, the list may prove of interest as a basis on which others may desire to work.

SELLING AUTOMOBILES FOR INSTALLMENTS.

The Studebaker Corporation has adopted a policy in which it will sell E-M-F and Flanders cars and accept payment in installments. This is acceptance of methods that have been the vogue with builders of farming machinery and equipment and which have developed business that would not, in all probability, be immediately realized. The reason stated by General Manager Walter E. Flanders is that the company considered the future rather than the present and believed its policy would prove quite as profitable as it has been for some of the concerns doing a country or world-wide business. The terms of sale that will be acceptable to the company have not been made public. The experiment, if it is regarded as such by the industry, will be observed with unusual interest. The installment plan, however, is not applied to the more expensive cars produced by this company.

WARNER TO MAKE CARBURETORS.

Announcement is made that a carburetor that will probably be known as the Warner is to be placed in the market by the Warner Instrument Company, Beloit, Wis. The preparations for manufacturing are making and it is probable that in a short time the carburetor will be offered for sale. It is stated that the instrument has been experimented for a considerable period and that for it unusual results and decided fuel economy are claimed. It is held that the high standard established by the company in its speed and distance indicators will be maintained, and that the carburetor will be marketed through the same channels utilized for the auto-meters.

F. S. FISH SUCCEEDS STUDEBAKER.

Frederick S. Fish, vice president of the Studebaker Corporation, has become president of the company, succeeding J. M. Studebaker, whose resignation was accepted at the last meeting of the board of directors. While this terminates Mr. Studebaker's activities as head of the company he remains chairman of the board of directors and will continue in the directorate. Clement Studebaker, Jr., is now first vice president and chairman of the executive committee of the board of directors. A. E. Erskine and Scott Brown were continued as treasurer and secretary and general counsel, with Frederick P. Delafield as special counsel. J. N. Gunn is general manager of the company, a new office, with offices at New York, N. Y. He has been a member of the firm of Gunn & Richards, production engineers.

KISSEL COMPANY INCREASES STOCK.

The stock representing the capital of the Kissel Motor Car Company, Hartford, Wis., has been increased from $400,000 to $1,000,000. This has been necessary to provide for the expansion of the business, both in manufacturing and marketing. The additions to the factory now making include a building 107 by 407 feet, three stories in height, and a single story structure 50 by 407 feet. These will afford 150,767 square feet, or nearly three and a half acres of floor space that will be available for manufacturing. The factory equipment will include a trolley line for the transportation of material about the works. The buildings will be ready for occupancy by the first of the year.

FLOATING TYPE AXLE NOT INFRINGED.

The withdrawal of the suits alleging infringement of patent instituted against the National Motor Vehicle Company of Indianapolis, Ind., by Thomas J. Lindsay and Willard Harmon, who claimed to be holders of basic patents, establishes that there is not in this country a patent that controls the manufacture of this type of axles. The suits were begun in 1905 and were heard in part by Judge Anderson in the United States Court at Indianapolis last June. The action disposing of the suits is claimed to be a conclusion reached by all persons at interest that the patents relied upon had been anticipated by the English patent granted to Elliott in 1893.

SALE OF CARS NOT INTERSTATE COMMERCE.

The contention that the sale of automobiles was interstate commerce and that as such a business was not amenable to the Pennsylvania statute imposing a tax of one per cent. has been decided by the United States Supreme Court in favor of the state authorities, who had endeavored to collect the tax from the Banker Brothers' Company, Pittsburg. The company was taxed for sales amounting to $351,000 and after the state courts had decided adversely to it carried the cause to the highest tribunal.

BUYS NEW FACTORY PROPERTY.

The Briggs-Detroiter Company, Detroit, Mich., has acquired about two acres of land and the buildings thereon at Hamtramck, in that city. The property was owned by the Reinforced Concrete Pipe Company, but the structures had never been used. The leaders of the company are Claude S. Briggs, president of the Detroit Dental Company, and John A. Boyle, vice president of the Brush Runabout Company. It is stated that the company is to equip the factory as rapidly as this can be accomplished, and manufacturing will be begun as soon as possible.

DEMOTCAR PLANT CHANGES HANDS.

The plant of the Demotcar Company, Detroit, has been acquired by C. H. Ritter, R. A. Skinner and A. W. Voege, who will manufacture a four-cylinder runabout which will have a motor with bore of 3.25 inches and stroke of 3.37 inches. The car will have a multiple disc clutch and two forward speeds and reverse selective type transmission. The wheelbase will be 90 inches. The machine will be sold completely equipped.

METZGER COMPANY SELLS BONDS.

An issue of bonds drawing interest at six per cent., $5000 maturing May 1, 1912; $15,000 maturing June 1, 1912, and $15,000 maturing July 1, 1912, has been sold by the Metzger Motor Car Company, Detroit. The bonds are secured by a first mortgage on the company's property.

McCORD COMPANY ENLARGING.

The business of the Precision Appliance Company, Chicago, Ill., has been acquired by the McCord Manufacturing Company, which will continue the manufacture of Hill precision oilers in connection with McCord oilers at Detroit. The facilities of the McCord company have been considerably increased.

NEW BUILDING FOR CHALMERS COMPANY.

A building of brick and steel, two stories, 75 by 180 feet, is being erected at the Chalmers Motor Company's plant, Detroit, this expansion being made necessary by the increased volume of work.

Victor Hemery, the racing driver with fame on both continents, is expected to associate himself with the J. I. Case Threshing Machine Company, Racine, Wis., as consulting engineer and supervisor of the racing team that concern expects to maintain to exploit Case cars.

TRADE AND FACTORY ACTIVITIES IN OHIO.

Works Busy and Products in Large Demand With the Manufacturers in This State.

The Schacht Motor Car Company, Cincinnati, has engaged E. W. Arbogast, formerly general manager of the De Tamble Motor Company, Anderson, Ind., as manager of its Chicago branch.

A meeting of the stockholders of the Miller Rubber Company, Akron, was held Dec. 15 for the purpose of increasing the capital from $500,000 to $1,000,000.

Business is very lively at all of the Akron rubber factories and it is expected that 2000 workers will be added to the 17,000 now employed in these works for the winter.

The capital of the Sandusky Auto Parts and Motor Truck Company, Sandusky, has been increased from $150,000 to $500,000. The organization is with A. F. Knotts as president and R. D. Mitchell as secretary.

A new battery department has been created at the works of the Apple Electric Company, Dayton, which is to produce storage batteries for electric lighting systems and all general purposes as well as motor vehicles and power boats.

Ordered 50 Electric Wagons.

The American Express Company has ordered 50 electric delivery wagons from the Baker Motor Vehicle Company, Cleveland, to be delivered as early as is possible.

A factory of the Electric Auto-Lite Company, Toledo, is being equipped with machinery and will shortly be operated.

The Universal Machine Company has removed from Toledo to Bowling Green, where it occupies a new factory having 22,000 square feet of floor space, where it will build motors and later automobile parts.

A considerable quantity of stock and equipment of the Norwalk Motor Car Company has been sold by the receiver in bankruptcy to the Model Gas Engine Company, Peru, Ind.

New Plant Will Employ 150.

The new plant of the American Tire & Rubber Company at Akron, which will produce tire tubes and repair stock and employ 150 hands, will be in operation before the end of the year. The company has these officers: President and treasurer, Adam Duncan; vice president, Gilbert C. Waltz; secretary, F. L. Kryder; directors, Adam Duncan, Gilbert C. Waltz, F. L. Kryder, Harvey Musser, Gustavus Sieberling, C. M. Wertz, Frank Miller, L. C. Henderson and L. C. Rowe.

The new plant of the Warner Manufacturing Company, Toledo, which has 100,000 square feet of floor space and employs 1000 men to increase its facilities, is being operated day and night. The factory has a capacity of from 40,000 to 50,000 transmissions and steering gears annually.

Receiver of Mansfield Company.

S. P. Ward of Mansfield has been appointed receiver of the Mansfield Rubber Company, engaged in the manufacture of automobile tires, which has been adjudged a bankrupt at Cleveland. The concern is capitalized at $25,000.

A committee of stockholders has been appointed to consider proposals made to purchase the Howard Motor Company of Galion, and to dispose of the business as is deemed best.

The Union Motor Car Company has made arrangements to produce a two-passenger runabout of low price which will be known as the Union 25 at the works of the Dunlap Engineering Company, Columbus. J. W. O'Brien of Nashville is the head of the concern, which will be, it is proposed, capitalized for $500,000.

The K-W Ignition Company's new factory at Cleveland is completed and will be occupied the present month. It is 165 by 75 feet, four stories, of steel and concrete construction, and is practically fire proof.

With capital of $50,000 the Dunlap Manufacturing Company has been organized at Columbus, O., to manufacture automobile parts and pneumatic tools, by S. H. Dunlap, T. C. Dunlap, L. F. Sater, B. G. Watson and A. N. Schetenstein.

The Firestone Tire & Rubber Company, Akron, has appointed A. G. Partridge as its assistant sales manager.

Now Has Chicago Branch.

The Standard Welding Company, Cleveland, has established its branch at Chicago, Ill., to succeed an agency, which is in charge of A. C. Clark and B. A. Quayle, from which Illinois, Wisconsin, Iowa, Missouri, Indiana and other states will be served.

Frank L. Sessions, graduate of the Worcester Polytechnic Institute, class of '89, a member of the American Institute of Electrical Engineers and of the American Society of Mechanical Engineers, has been made superintendent of the Standard Welding Company, Cleveland.

The product of the O'Neil Tire Protector Company, Akron, is now marketed by Harry Israel, who is located at 1806 Euclid avenue, Cleveland.

Big Goodyear Dividend.

The Goodyear Tire & Rubber Company, Akron, has declared an annual dividend of 12 per cent. on its common stock, payable Jan. 1. It is stated that the company has earned more than 50 per cent. on its common stock.

The agents for the Speedwell trucks were recently in convention for two days at the factory at Dayton, O., where they were given special information relative to the trucks and instructed in systematized selling methods.

Representatives of the Baker Motor Vehicle Company, industrial department, met at the factory at Cleveland recently, and for three days studied the wagons and trucks in process of manufacture and received instruction in selling methods approved by the company.

The Standard Top and Equipment Company, Cleveland, has passed into the control of W. J. Collins, A. P. Fishley and G. H. Wintenberg, who have been named president, vice president and secretary-treasurer respectively. The concern is capitalized for $15,000.

MOTORETTE COMPANY FAILS.

Because of the objection of one of the largest creditors to a proposition for reorganization the C. W. Kelsey Manufacturing Company, Hartford, Conn., has been petitioned into insolvency by Lawrence A. Howland, acting for a committee of creditors. The property of the company was attached the same day by a creditor. Whether the creditors will arrive at a conclusion that will permit the company to continue is uncertain. C. W. Kelsey, head of the company and designer of the motorette that has been manufactured, was for several years associated with the Maxwell-Briscoe Motor Company, and later was connected with the Columbia division of the United States Motor Company. While a student at college he constructed a three-wheeled motor car that was entirely practical, and being convinced of the practicality of this type of machine he organized the company to build and market his creation.

H. E. Steinbock, for a considerable period connected with the engineering department of the Maxwell-Briscoe Motor Company, the Brush Runabout Company and the United States Motor Company, is organizing a company to manufacture a car of his own design.

WITH THE ILLINOIS MANUFACTURERS.

Developments and Changes Among the Makers of Cars and Accessories.

The engineering force of the Stromberg Motor Devices Company has been augmented by E. A. Besson, recently with the American-La France Fire Engine Company, and prior to that with the Thomas and Stevens-Duryea companies.

The Emil Grossman Company has abandoned its Chicago branch and its products are now marketed in that city and vicinity by the Empire Auto Top & Supply Company, 1219-21 Michigan avenue.

J. W. Fulton has purchased the interest of F. W. Grubb in the Fulton-Grubb Company, factory sales agent at 1146 Michigan avenue, Chicago, and will continue the business.

The Velie Motor Vehicle Company, Moline, has taken over the business of the Velie Motor Car Company, Chicago, and will continue it as a branch establishment under the management of Morton H. Luce.

Authority to transact a general business in Illinois in automobile vehicles has been granted to the Studebaker Corporation of America, which has Illinois capital of $100,000.

Will Build Mogul Tractors.

The Mogul Motor Truck Company has been organized at Chicago to engage in a general business of manufacturing and selling power vehicles. The company has a capital of $125,000 authorized. The incorporators are John P. Hicks, Frank Dawson, George Griffith and L. S. Jones.

An automatic air pump or compressor is to be the principal production of the Acme Automatic Tire Pump Company, which has been organized at Chicago under Illinois law by Francis J. Hoolihan, Emil Rosenthal and Francis J. Carroll. The company has authorized capital of $50,000.

Electrical supplies will be manufactured by the Perfection Storage Battery Company, which has been organized at Chicago with capital of $50,000 by J. W. Hake, G. B. Lyons and C. E. Winters.

To Produce Accessories.

Automobile accessories will be produced by the National Spring Tire Company, incorporated at Elgin by C. H. Jackson, L. Valence and C. L. Siggman, Jr., all of Chicago, with capital of $125,000.

Babbitt and other metal castings will be manufactured by the National Brass Foundry Company, which has been incorporated at Chicago by G. McGuire, H. G. Decker and J. Prince.

Industrial power wagons will be built by the Stevens Motor Truck Company, which has been incorporated at Chicago by A. M. Stevens, L. F. Stevens and G. P. Stevens with capital of $60,000.

The Chicago office of Findeisen & Kropf Manufacturing Company, maker of the Rayfield carburetor, has now the service of F. H. Quick, formerly with the United States Motors Indianapolis Company.

The Paris Electric Starter Company has been organized at Paris, with Carl Farnham president, F. Fishback vice president, Chester Showalter secretary, and P. P. Shutt treasurer. The company will manufacture an electric starting device invented by Mr. Farnham.

The citizens of Christman are considering a proposition to raise $100,000 to invest in the Rayfield Motor Car Company as an inducement for that concern to remove to Christman from Springfield.

Robert M. Barker, who has assumed charge of the advertising of the Chase Motor Truck Company, Syracuse, N. Y., was assistant advertising manager and chief of the copy division of Swift & Co., Chicago, and has been connected with several New York agencies. He has had a diversified experience.

The Sternberg Manufacturing Company, Milwaukee, Wis., has delivered to a Chicago purchaser a truck with a six-cylinder 80 horsepower motor and having a capacity of eight tons.

Brandenberg & Co., with offices in New York, Chicago and Detroit, has become general sales agents for the Buda Company, Harvey, Ill., maker of motors, transmissions and automobile parts.

GATHERED FROM ALL POINTS.

A branch of the Goodyear Tire & Rubber Company has been established at 134-36 Oneida street, Milwaukee, Wis., under the management of H. P. Zeigler.

An amendment to the articles of incorporation of the Mitchell-Lewis Company, Racine, Wis., has increased the number of directors of that concern from 10 to 16.

A new engine, the invention of Julian Brown, is shortly to be produced commercially at Syracuse by a company headed by the inventor. He is a son of A. T. Brown, head of the Smith Premier Company, and of the Brown-Lipe Company, and of the Brown-Lipe-Chapin Company, who was for a long time one of the largest stockholders of the H. H. Franklin Manufacturing Company.

A branch factory of the Dowagiac Motor Car Company, Dowagiac, Mich., at Tulsa, Okla., is being equipped and should be ready for operation by the first of the year.

The factory of the B. F. Board Motor Truck Company, Alexandria, Va., is to be increased substantially by the erection of a new building.

Work has been begun on the new factory structure for the Kline Motor Car Company at Richmond, Va. The buildings will cost approximately $300,000 to erect.

New machine facilities are being added to the plant of the Morrow Manufacturing Company, Elmira, N. Y., which produces automobile and other special parts.

A single story brick addition is being made to the factory of the Niagara Gasoline Motor Company at Barton and Breckenbridge streets, Buffalo, N. Y.

The Matheson Automobile Company, Wilkesbarre, Penn., now has the service of G. S. Delaney as factory manager.

The Continental Car and Equipment Company, Louisville, Ky., has produced a truck of 7000 pounds capacity, which is to be manufactured in considerable numbers at a place to be decided upon shortly.

The Marathon Motor Works, Nashville, Tenn., has purchased the property of the Carbon & Oil Company for the purpose of increasing its plant and has increased its capital to $1,000,000. It is proposed to install about $225,000 worth of machine equipment and to have facilities for producing about 3500 cars annually.

The manufacture of a car to be known as the Moro is to be begun at Los Angeles, Cal., by a company headed by J. J. Morrow and James R. Fouche. A factory building has been leased and machine equipment has been installed preparatory to manufacturing.

The business of the Electric Vehicle Company, Louisville, Ky., has been bought by the Kentucky Wagon Company of that city, and it is proposed to produce all types and sizes of electric conveyances from 1000 to 7000 pounds capacity. This department is in charge of H. Hewitt, who was manager of the Electric Wagon Company.

The Walter Motor Truck Company has succeeded to the business of W. Walter at 49-51 West 66th street, New York, N. Y., and it is intended to erect a factory and garage and produce Walter trucks in considerable numbers. The company has $100,000 capital.

Proposition For Live Dealers

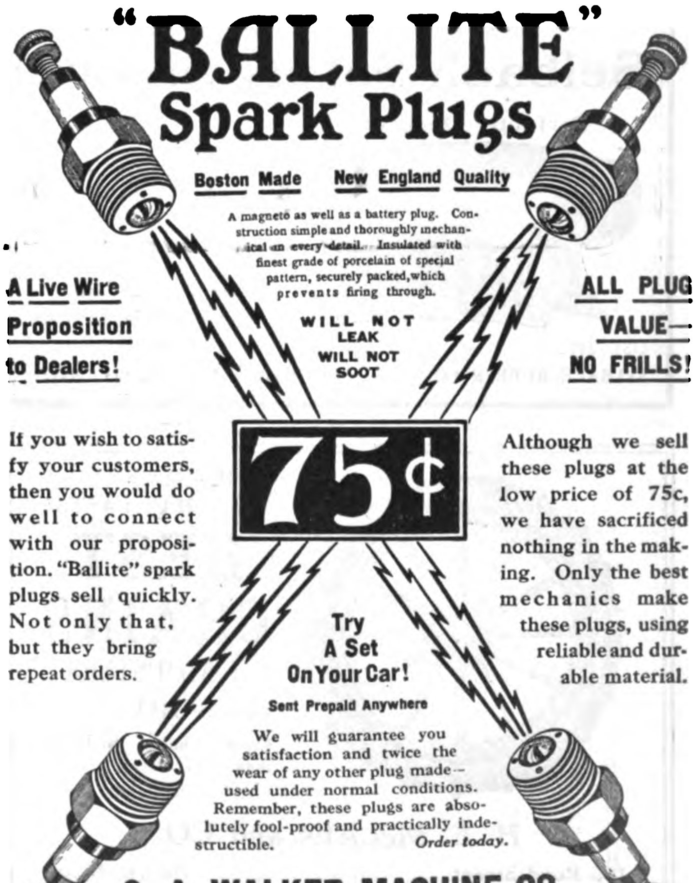
EAGLE OIL & SUPPLY CO.

104 Broad Street, Boston, Mass.

The Oil with the 20,000 mile record.

Ask about it.

It suits and does not soot. In 4 and 6 cylinder water cooled cars.



"BALLITE"

Spark Plugs

Boston Made New England Quality

A magneto as well as a battery plug. Construction simple and thoroughly mechanical in every detail. Insulated with finest grade of porcelain of special pattern, securely packed, which prevents firing through.

WILL NOT LEAK
WILL NOT SOOT

A Live Wire Proposition to Dealers!

If you wish to satisfy your customers, then you would do well to connect with our proposition. "Ballite" spark plugs sell quickly. Not only that, but they bring repeat orders.

75¢

ALL PLUG VALUE—NO FRILLS!

Although we sell these plugs at the low price of 75c, we have sacrificed nothing in the making. Only the best mechanics make these plugs, using reliable and durable material.

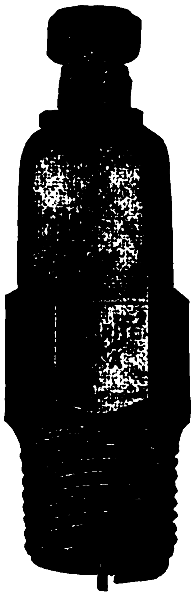
Try A Set On Your Car!

Sent Prepaid Anywhere

We will guarantee you satisfaction and twice the wear of any other plug made—used under normal conditions. Remember, these plugs are absolutely fool-proof and practically indestructible. *Order today.*

G. A. WALKER MACHINE CO.

83 Braintree St., Allston Station BOSTON, MASS.



"STA-RITE" Spark Plugs

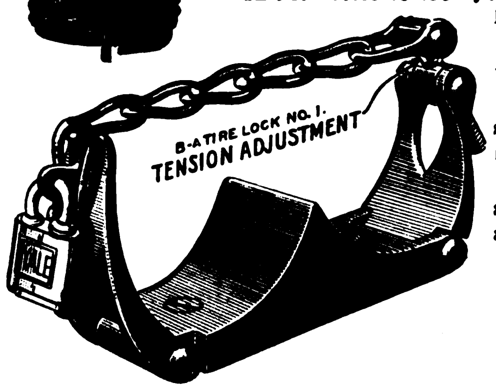
They are the kind that stay right the longest.

We guarantee every plug against breakage and when they wear out or you break them accidentally, if you return them to us express prepaid, we will repair them for you free of all charge.

The "STA-RITE" plugs are designed for magneto and battery use and are made of a double casing of porcelain.

They list for $1.00 each. We give liberal discounts to the trade. Jobbers and catalogers, write us for our special catalog proposition.

"B-A" AUTO TIRE LOCKS



Isn't it better to lock your tires on your car before they are stolen, than to have them stolen and lock the next ones on?

The "B-A" auto tire lock is simple in construction, yet a positive protection against tire thieves.

We furnish them in black, bronze or nickel. It is made of a cast steel base; drop forged shackles, case hardened steel chain, fitted with high grade Yale padlock.

The "B-A" is absolutely the only adjustable tire lock on the market and will take care of demountable rims. It will prevent chafing of tires and is guaranteed against breakage.

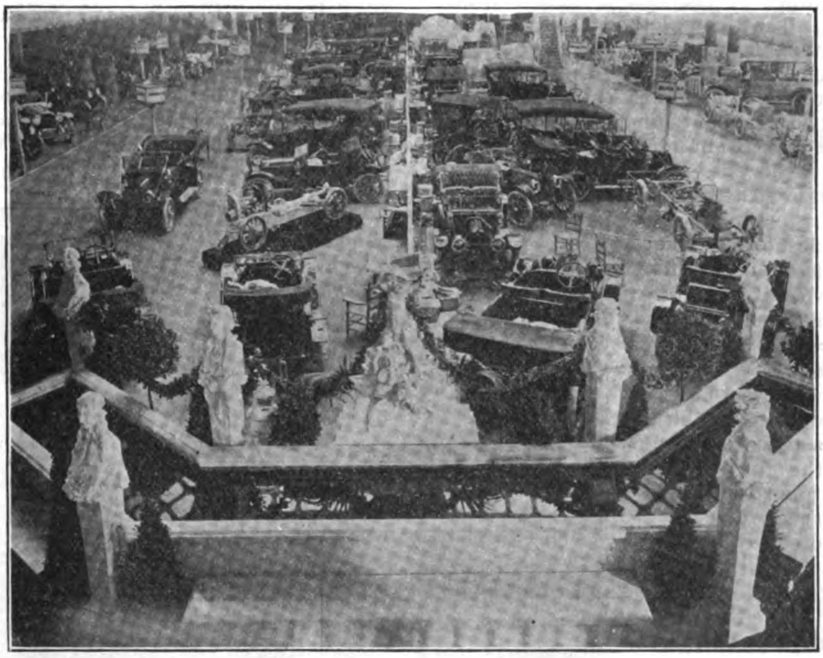
NEW YORK'S SHOWS GREAT SUCCESSES.

Largest Number of Enormous Industry's Products Ever Exhibited Attracts Throng That Overwhelms Metropolis—Decided Progression in Every Phase of Pleasure Car and Service Wagon Design and Construction.

THE New York automobile shows, the last of which will come to an end the evening of Jan. 20, have been from every point of view the most valuable to the trade and industry ever organized in the United States. While this statement does not reject the volume of business transacted it is made with direct reference to the education of the manufacturers, distributors, and agents to the unquestioned merits of the differing lines represented. Nothing can be more promotive of trade than a knowledge of what the people want, and what the people want they must be given. The acquiescence to demands in design and equipment indicates better than any other factor to what extent the market has been studied and the degree to which requirements have been incorporated in the machines.

So far as the shows themselves are concerned they were decidedly attractive as to decorations. Great care had been taken to have the settings appropriate and in keeping with the spirit of the expositions. The attendance has been large and the visitors have come from all sections of the United States. When New York is so overrun that its hotels will not accommodate all who would be guests, and this influx is attributed to the displays of motor cars, it may be judged that there is a degree of interest manifested that is as widespread as it is surprising.



The Auditorium at Madison Square Garden from the Entrance, During the Display of Pleasure Cars.

The first exhibition was that in the ball room of the Hotel Astor, organized as the Importers' Salon, which was opened Jan. 2 and was concluded Jan. 10. This was necessarily a small display for but 62 cars and chassis of 17 different makes were shown by the 15 exhibitors. The show was decidedly interesting, however, and there were several new body and engine designs seen that were as especially attractive to American designers as they were to the visitors.

The Madison Square Garden show, which after all may not be the last to be held in that auditorium, was opened the evening of Jan. 6. This was the first or pleasure car section in which was displayed a total of 415 exhibits, this being the largest number ever seen at any metropolitan exhibition. It was thoroughly representative and it was decidedly complete. Viewed from every aspect the show was better than in any previous year and it was an undertaking of no little proportions to systematically examine each exhibit and give to each the time that was really necessary to make intelligent comparison. The exhibition space available limited the showing of cars, there being but 60 different makes displayed, and there was a disposition to subordinate the chassis to the complete car to a greater extent than in any previous show. This fact was especially noticeable of some of the best known machines. In other words there appeared to be a realization that the buying and interested people could obtain whatever information was desirable from inspection of the finished vehicle equally as well as from

The Exhibition of Service Wagons on the Main Floor of Madison Square Garden, as Seen from the Balcony.

the stripped mechanism, while the former could be shown to satisfy practically all inquirers.

There were in all 189 complete cars shown and of these four were cooled by air. This number included 112 touring cars in the common acceptance of the term, and 40 runabouts, a total of 152, while in addition were shown 12 limousines, 12 berlines, five coupes, three phaetons and two landaulets. Outside of these there were four special exhibits, three being racing cars and one the winner of the last contest for the Glidden trophy. In all 41 complete chassis without body equipment were displayed, this bringing the total of gasoline conveyances up to 234. There was as well a division of electric machines shown that included nine coupes, two runabouts and two broughams.

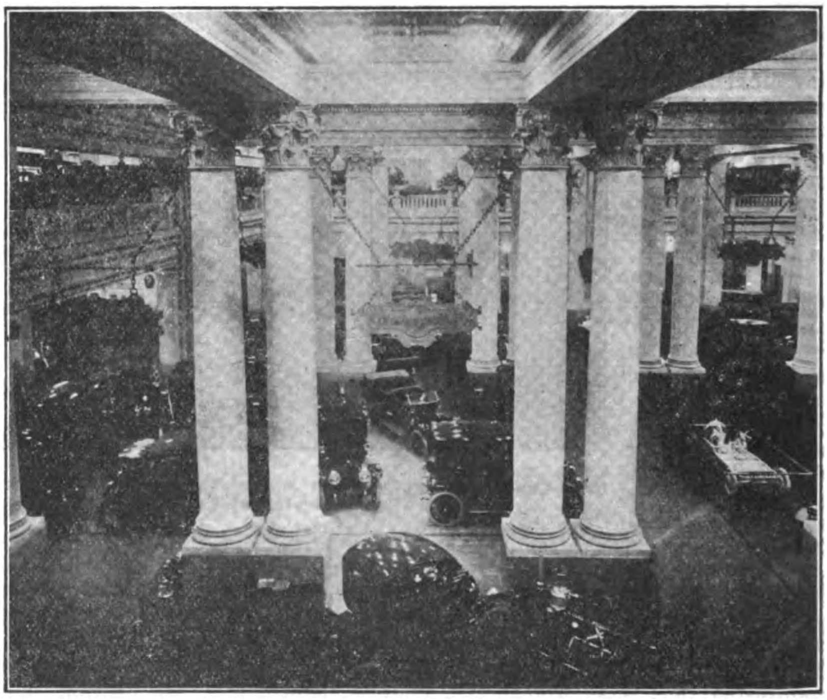
Summarizing the cars by number of engine cylinders there were three of one cylinder, three of two cylinders (including two two-cycle motors), 134 of four cylinders (including four two-cycle and six sleeve valve motors), and 49 of six-cylinders (including one sleeve valve motor). By percentage the one and two-cylinder motors represented 1.58 per cent., the six cylinders 25.93 per cent. and the four cylinders 70.89 per cent. of the total of 189 exhibition cars. Of the chassis the six-cylinder numbered 14 and the four-cylinder 27, the relative proportions being 34.14 and 65.86 respectively.

The section devoted to motorcycles was unusually interesting, there being no less than 16 makes exhibited, which included 45 single-cylinder machines, 18 twins and two with four-cylinder motors, the total being 65. There was no question of the decided interest taken in these vehicles.

The accessory exhibitors totalled 329, these including 10 different publishing firms printing from one to three magazines. The grand total for the first week of the show was 405, but this number was somewhat reduced with the opening of the second week when 31 different makes of power wagons replaced the pleasure cars and these represented approximately 100 different types of chassis. The accessory exhibitors continued with comparatively few changes, but the motorcycles were withdrawn. This was by far the largest and best display of power wagons ever shown in America and the majority of the exhibitors were those who have been engaged in the production of pleasure cars for considerable periods. Of the 31 different makers but seven exclusively produce service vehicles, and eight of the 31 build electric machines. It will be observed there is a decided gain in the number of battery driven wagons, both as to make and number, when this show is contrasted with previous exhibitions.

The interest manifested in the power wagons was surprisingly keen and it may be said that with rare exceptions the visitors were impelled by desires to purchase or to study the conveyances at close range with a view of utilizing them in present or prospective business interests. Those in attendance came from all sections of the country and this was regarded as being an indication of a practically universal demand for motor transportation wherever business exists in sufficient volume. Besides there were many who had special problems to submit to the experts of the different concerns exhibiting, in many instances large investments being prospective.

The exhibition of the National Association of Automobile Manufacturers at the Grand Central Palace, which was inaugurated the evening of Jan. 10, was large in the sense that the total number of vehicles displayed was considerably larger than at Madison Square Garden. It being for both pleasure and service wagons the visitors were interested in both classes of machines and the exhibition took on the nature of the shows of previous years. Grand Central Palace, with its three floors, the main hall being on the second floor, does not give the impression of large area, but



A Glimpse Between the Massive Pillars of the Main Hall, Grand Central Palace, During the N. A. A. M. Exhibition.

it contained 36 different makes of pleasure automobiles and 37 different makes of power wagons, a total of 73. As a rule the cars were of the low and moderate prices but there was every grade of service transport, from the tiny "one lunger" to the truck with 15,000 tons capacity. The exhibition served to make known to the metropolitan experts a considerable number of machines that had never before been displayed, and naturally there was an unusual degree of interest in whatever was shown for the first time, this applying to both the pleasure and service vehicles. The number of accessory exhibitors was small as compared with the total showing at Madison Square Garden, and in several instances displays were made at both exhibitions. The visitors were numerous and it might be stated that many so timed their visits to New York to see the show at Grand Central Palace and the last of the pleasure car and the first of the power wagon shows at Madson Square, a plan that made it possible to get the benefit of all three.

The volume of business transacted at all shows cannot be measured by the number of vehicles or articles disposed of while they are in progress, but if one is to judge the probable results from the actual interest obtaining, and the careful attention directed to the exhibits, it is entirely reasonable to assume that the exhibitions will in every way bring satisfactory returns to the motorists generally and to the organizers specifically.

COFFIN HEADS CONTEST ASSOCIATION.

Howard E. Coffin of the Hudson Motor Car Company was chosen president, A. L. Riker of the Locomobile Company of America vice president, E. R. Hollander of the Fiat Automobile Company secretary-treasurer, and Russell A. Field assistant secretary-treasurer, at the annual meeting of the Manufacturers' Contest Association, Inc. The first three officers and George M. Dickson of the National Motor Vehicle Company, and C. A. Emise of the Lozier Motor Company, constitute the board of directors. Howard Marmon of the Nordyke & Marmon Manufacturing Company was continued as chairman of the rules committee, S. A. Miles, from the National Association of Automobile Manufacturers; H. A. Bonnell from the Automobile Board of Trade, and Jesse Froelich from the Importers' Salon were named as an advisory committee to the contest board of the American Automobile Association. E. R. Hollander, A. L. Riker, C. A. Emise, M. C. Meigs of the Pierce Motor Company and P. D. Wagoner of the General Vehicle Company were made a committee to confer with the American Automobile Association relative to a policy as to racing competitions. The membership of the organization increased from 39 to 93 members during the year.

DUNN SUCCEEDS HIMSELF.

H. T. Dunn of the Fisk Rubber Company was elected to succeed himself as president for the present year, and to succeed himself as director for three years, at the annual meetings of the members and directors of the Motor and Accessory Manufacturers, Inc., which were held recently. In addition to Mr. Dunn, L. M. Wainwright of the Diamond Chain & Manufacturing Company, and E. S. Fretz of the Light Foundry & Manufacturing Company were chosen directors, and F. C. Billings of Billings & Spencer Company, was elected to fill the vacancy in the directorate by the resignation of F. E. Castle. At the meeting of the directors Mr. Dunn was chosen president, with these associates: James H. Foster first vice president; C. E. Whitney, second vice president; Claire L. Barnes, third vice president; L. M. Wainwright, secretary; William M. Sweet, general manager. The John L. G. Dykes Company, Chicago, Ill.; Cotta Transmission Company, Rockford, Ill.; American Bronze Company, Berwyn, Penn., and the Detroit Lubricator Company, Detroit, Mich., were elected to membership. Executive, show and allotment, finance, traffic and membership committees were appointed. The show and allotment committee consists of D. J. Post, chairman; H. E. Raymond, C. T. Byrne, James H. Foster and F. C. Billings.

U. S. TIRE COMPANY FILES APPEAL.

The patent claims of the Republic Rubber Company, Youngstown, O., having been sustained in its suit alleging infringement of its rights by Morgan & Wright, Detroit, Mich., one of the subsidiary companies of the United States Tire Company, recently tried before Judge Hazel in the United States Circuit Court for the Southern District of New York, appeal has been taken by the defendant corporation for review by the United States Circuit Court of Appeals. Pending the determination of the appeal the United States Tire Company and the Republic Rubber Company have reached an agreement whereby the manufacture and sale of the tires on which the suit was based will be continued without interruption.

COL. CLIFTON AGAIN PRESIDENT.

Col. Charles Clifton, president of the Pierce-Arrow Motor Car Company, for a number of years executive of the Association of Licensed Automobile Manufacturers, was chosen for the second time head of the Automobile Board of Trade at the annual meeting of that body. The other officers chosen are Charles C. Hanch, vice president; Col. George Pope, treasurer; Benjamin Briscoe, secretary, and these officers with S. T. Davis, Jr., Hugh Chalmers, S. D. Waldon and W. C. Leland, directors. H. A. Bonnell was re-elected general manager. The admission of the International Motor Company made the membership 51. Patents, trade, statistical, show, legislation and law, intercourse and arbitration, good roads, publicity and mechanical co-operation committees were named. The show committee for 1913 consists of Col. George Pope, Alfred Reeves and Merle L. Downs.

PACKARD PROFIT 14 PER CENT.

According to the annual statement of the Packard Motor Car Company, Detroit, Mich., the net profit for 1911 was 14 per cent. on capital of $10,000,000. The resources of the company are stated as $16,110,756.28, of which $8,265,845.82 is the plant. The surplus charged in the liabilities is $2,984,021.81. The plant has 37.7 acres of floor space and the maximum number of employees for 1911 was 7575 in August with a monthly payroll of $524,407.

TIRE PRESSURE GAUGE LITIGATION.

A. Schraeder's Sons, Inc., making answer to the suit of the Twitchell-Garvey Manufacturing Company of Los Angeles, Cal., at New York, which alleges infringement of patent, denied the allegation and set up a patent owned by the defendant dated March 1, 1898, which is claimed to be so different as to remove the defendant entirely outside the claims of the plaintiff, aside from the matter of date.

VAN DYKE PLANT BOUGHT BY FEDERAL.

The plant of the bankrupt Van Dyke Motor Car Company, Detroit, Mich., with its machine equipment has been bought by the Federal Motor Company, which is now ready to operate it for the production of cars. The plant has a capacity of 1000 cars a year with ample space for extensions to double this output.

WHO'S WHO IN THE INDUSTRY.

DR. C. G. PERCIVAL, "PUBLICEST."

Few promoters of the use of the motor car are as well known as Dr. Charles G. Percival of New York, N. Y., formerly of Boston, who describes his profession as "publicest," and who has been engaged in advertising and publicity promotion for years. He is now driving the Abbott-Detroit "Bull Dog" the 100,000-mile tour in the United States, Mexico and Canada, undertaking travel over roads that were never before driven over by a motor vehicle. He has visited 44 of the states in the Union and recently returned from Alaska where he ventured over trails that were hardly passable for animals. Just where his tour will eventually lead is somewhat dependent upon circumstances, for it would appear he has exhausted all the extremes and must now settle down to ordinary driving.

Dr. Charles G. Percival, Now Driving the Abbott-Detroit "Bull Dog" on the 100,000-Mile Tour.

Dr. Percival was well known in bicycle days as a writer and manager, and was official handicapper for the League of American Wheelmen. Later he became identified with motoring as advertising manager and in this capacity has been connected with some of the best known concerns in the industry. He has originated and directed some exceedingly interesting "stunts" and naturally has become widely and favorably recognized the country over as the only and original "Doc." Percival.

SAMUEL A. MILES.

When the Chicago automobile show will be opened the evening of Jan. 27 it will be the largest and most comprehensive display ever organized by that past master of western motor vehicle displays, Samuel A. Miles, who has directed all of the exhibitions held in Chicago for more than a decade. Mr. Miles always leads a double life as manager, from the fact that he devotes himself the year round to the promotion of the Chicago exposition, which is organized under the auspices of the National Association of Automobile Manufacturers, and he is also general manager of that body. This season when the association decided to conduct a combined display of pleasure and service wagons at Grand Central Palace in New York City, Mr. Miles was selected to assume the management of this third exhibition also, this responsibility making him the most multifarious manager known to the industry and the trade. Mr. Miles, however, permitted his duties to rest but lightly upon him and he might have taken on another show or two had he been properly approached.

Samuel A. Miles, Manager of the Chicago Motor Vehicle Shows.

Mr. Miles knows the Chicago people and they likewise know him. Incidentally he has been the cause of more westerners buying automobiles than is realized. He doesn't know how many himself, but he says he believes that it will aggregate a good many thousands. Mr. Miles says of the Chicago pleasure and vehicle displays that they will be in every way more satisfactory than in previous years, and that they should be decidedly more attractive and productive.

CHESTER I. CAMPBELL.

The one man toward whom all of the motorists of New England turn with expectancy is Chester I. Campbell, general manager of the two power vehicle exhibitions to be held in Boston at Mechanics' building under the auspices of the Boston Automobile Dealers' Association, and the Boston Commercial Motor Vehicle Association, of which organizations he is secretary. Mr. Campbell has had a hand in the conduct of every exhibition of automobiles organized by the agents of Boston, and for a number of years he has devoted practically all his time to the preparations for and the direction of these displays. Naturally he knows his field, the possibilities, and his resources better than any other man living. In every respect the Boston shows have been successful and it is not too great praise to state that this has been largely due to Mr. Campbell's foresight and energy.

Chester I. Campbell, Manager of the Boston Motor Vehicle Shows.

As a matter of fact, it has been Mr. Campbell's policy to begin work for the year to come long before the show he had in hand has been held, and it is not uncommon for him to have applications for space a year or two ahead. This year Mr. Campbell sauntered over to Europe to take a respite from his strenuous task and incidentally make a few notes for guidance in his choice of decorations. Mr. Campbell is probably as well known as any executive of automobile shows in America and he has undoubtedly been so successful that he will continue to serve in his present capacity until he retires from active participation in business.

MAY BUILD LAUTH TRUCKS AT GIBSONBURG.

The Lauth-Juergens Motor Truck Company, Fremont, O., will build a branch factory for the manufacture of trucks at Gibsonburg, O., the coming spring conditionally upon the citizens of that town subscribing $50,000 to the capital of the company.

MAGNETOS FOR GAS ENGINE SERVICE.*

Principles Involved in the Design of Standard Instruments, Features of Construction and Conditions Essential to Efficient and Continued Operation of This Generally Adopted Source of Electric Energy.

THE basic principles underlying magneto operation and methods of producing current in the conventional revolving armature type have been considered at length in previous discussions, but there has been such an appreciable improvement and refinement that further exposition is needed to bring the subject up-to-date. The magneto is now the most popular method of ignition, it is used on the smallest and cheapest runabout as well as the most expensive touring car. Therefore, a review of the methods of construction, the principles of operation and the application of the leading types is timely and should be of value to those who have to do with internal combustion engines of any form.

Two High-Tension Systems Used.

There are two high-tension systems in common use, these being known as the "transformer coil" and the "true high-tension" methods, respectively. Each form possesses advantages and while there is some difference of opinion among designers and engineers as both methods are generally utilized, it must be said that both are good.

In the transformer system, the current generated by the magneto is one of low voltage, there being but one simple winding on the armature. To overcome the resistance of the air gap between the points of the plug in the cylinder, the tension of voltage must be increased. This is done by a separate coil, composed of two windings, and as the current potential is increased this appliance is called a "step up" transformer.

In the true high-tension instrument, the current is raised in value by the windings on the armature itself. Instead of a simple coil, two are employed. One of these is composed of a few turns of comparatively coarse wire, the other of many turns of fine wire. The former is the primary, the latter the secondary winding. Thus the entire apparatus is self contained, and the wiring is much simplified since there is no separate coil. With a transformer coil system, however, the addition of a set of batteries enables one to have a dual ignition system without other apparatus, which is considered to be an important advantage by many.

Two types of magneto generators are used in various ignition systems. The most common form employs the shuttle armature carrying the winding, the whole revolving in the magnetic flux present between the fields of the permanent magnets, the current being produced by the wires cutting the lines of force. The other method employs a stationary winding instead of a rotary one, and inductor pieces are mounted on the revolving shaft to change the path of the magnetic flux so it energizes the wire at certain portions of the revolution and thus generates the electrical impulse, producing a useful spark.

Both of these types may be divided into either of the classes previously mentioned. The principles involved in revolving winding types have been emphasized, but those on which inductor magnetos are based are not as generally known so it will be desirable to consider them before describing the instruments in which they are utilized.

Action of Inductor Magneto.

In order to utilize the energy produced in a revolving winding, some form of sliding contacts or brushes is necessary to lead it to the external circuit. These are attached to some stationary part of the magneto and bear against slip rings or other revolving contacts connected to the winding. Vibration or dirt may cause the brushes to be separated slightly from the parts against which they bear. While a high-tension current will pass through without difficulty, when these carry a current of lower potential, it may not have sufficient strength to overcome the resistance interposed and irregular ignition may result. The advantage of having a stationary winding is thus emphasized by those favoring the inductor type of magneto.

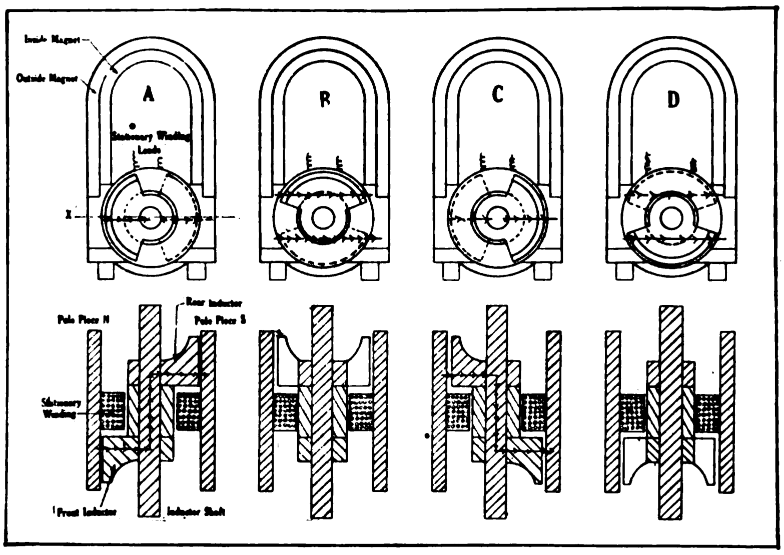


Fig. 1—Principles of Inductor Magneto.

We have seen that in a revolving wound armature the current was produced by the coils of wire cutting the lines of magnetic energy, and that the electromotive force or tension of the current was dependent upon the rate of cutting. A winding of several turns may be considered as several windings of one turn connected in series, so a higher voltage is obtained when a number of convolutions are used, just as when a number of cells are connected in series to obtain a higher potential than that obtained from a single element.

Elementary Parts of Inductor Magneto.

Certain elementary parts of an inductor magneto are shown at Fig. 1, and the position of the drive shaft and inductors at different portions of a revolution is also shown. The upper view shows the magneto as it would appear with the end plates removed, the lower illustrations depict sections along the line X-Y of the corresponding drawing above them. Two magnets are shown, but there are more in a practical instrument because a series will supply more magnetic flux or energy than a single pair. These are securely fastened with all the north poles against the pole piece N and all the south poles against the pole piece S. These are iron, but the base is brass. If an iron or steel base were used, part of the magnetism would escape through it instead of taking the proper course.

---

*This article, which is descriptive of a number of the best known magnetos to be found in the market, and which are standard with motorists, is reproduced from the "A B C of Magneto Ignition Systems," one of the series of Standard Handbooks of Automobile Mechanics *published* by The Automobile Journal Publishing Company. *It will* be continued through several numbers.

Fig. 2—Sectional View of Remy Magneto, Showing Stationary Coil and Revolving Inductor.

The stationary coil is securely retained by the pressure of the pole pieces against it and by a clip. Two inductors are mounted on the shaft and rotate with it. In order to form a path for the magnetic force, the inductors, core and shaft are composed of magnetic material. The direction of magnetic flow through the revolving parts is indicated by the arrows, the full ones showing the path through visible parts, the broken ones mark out the course taken through a normally invisible component.

In position A, the front inductor is adjacent to the pole piece N and the rear inductor is close to S. An iron path is formed between the inductors by the shaft and core. The cross section of the shaft is not large enough to carry all the magnetism so the core assists by carrying part of the flux. The magnetism thus passes from the pole piece N to the front inductor, through the core and shaft to the rear one and thence to the pole piece S. The magnetism passes through the coil in this instance from the front to the back.

In position B, the inductors are so placed that each one forms a path between the pole pieces N and S, and the magnetic force does not pass through the coil because of the shorter direct path provided by the inductor assembly. In position C, the conditions are similar to those shown at A except that the flow of magnetism is reversed, passing through the coil from back to front. When the parts are as shown at D, the same effect is obtained as in position B except that the front inductor is down, and the back one up. In this position, no magnetism passes through the coil.

It will be seen that as the inductors revolve the amount of magnetism passing through the coil is continually varying, thereby inducing in the winding an electromotive force, which is reversed twice during each revolution when the inductors pass the positions A and C. As long as the direction of the magnetic flow remains the same, increasing and decreasing flow induces electromotive forces in the winding having opposite directions. Increasing magnetism in one direction and decreasing flow in the opposite path induces a current having the same course.

Features of Remy Magneto.

A magneto, as constructed, contains in addition to the simple elements shown at Fig. 1, the parts shown at Fig. 2, which depicts the typical form based on the inductor principle. It will be seen that there is a circuit breaker, often called a contact maker or timer, and in addition, when the device is to be used for more than one cylinder, a distributor. The former consists of a cam, a cam lever and contact points. The cam is secured to and driven by the inductor shaft, and at certain parts of the revolution, it causes the contacts, which normally touch, to separate twice per turn of the shaft. The distributor is used to collect the high-tension current obtained from the transformer coil and supply it to the spark plugs at the proper time to insure firing the combustible gas in the cylinders of the motor.

The distributor is of hard rubber, attached to the frame of the magneto. There is a round opening in the middle, and the various wires leading to the spark plugs project into this. A revolving disk of hard rubber is employed to carry the distributor segment. This revolves, passing close to the wires leading to the spark plugs but it does not touch them. The hard rubber disc carrying the segment is secured to the distributor shaft, which is geared to the inductor drive shaft. The magneto furnishes current for a spark every half revolution of the inductors and the gearing between the main and distributor shafts is such that for every revolution of the former, the distributor segment advances from the position for firing one cylinder to that causing the high-tension current to flow to the next one. In a four-cylinder magneto, the distributor shaft makes one revolution for every two

Wiring Inductor Magneto.

While an inductor magneto can be utilized in the same manner as that from any alternating current producer, the usual method of wiring is shown at Fig. 3. The induction coil used in connection consists of an iron core surrounded by two windings, one, a primary consisting of a few hundred turns of coarse wire being wound directly upon it. The other, which is wound over the primary is called the secondary and contains several thousand convolutions of fine conductor.

In use, the low-tension current, either from the magneto winding or battery, is allowed to flow through the coarse wire, and when interrupted, a current of high potential is induced in the secondary winding because of the great suddenness with which the magnetism leaves the core. The interruption of the primary circuit is produced by the contact points of the timer being separated under the influence of the cam.

As these points separate the current still tends to flow and a brilliant spark or arc is formed between them. This is objectionable, and its heat would eventually burn the points away if the effect was not minimized by the condenser forming part of the coil, which absorbs the surplus current. The condenser consists of layers of tinfoil separated by insulation, the alternate sheets being connected to the same terminal. This component is shunted between the contact points as shown in diagram.

The parts shown have been described and their functions discussed. Their relations to each other must be considered to show how the low-tension current is changed to an impulse of higher potential. The coil box carries a switch on its face, the various connections leading to it being clearly shown in the diagram Fig. 3. There are three positions, battery, magneto and neutral or off. If the switch be turned to the magneto position, the current produced in the stationary winding flows through the primary winding of the induction coil, and this is stopped the instant the contacts separate. This stoppage induces a high voltage current in the secondary winding, which is led to the proper spark plug through the distributor. If the switch be on the battery position, the same thing occurs except that the energy is derived from the chemical producer, not from a mechanical generator.

Batteries Make Starting Easier.

Although the magneto may be used for starting, the batteries are supplied for emergency use and for making starting easier when the engine is cold or when conditions are not favorable to quick turning of the hand crank. Many four-cylinder cars can be started, if there be gas in the cylinders, without the handle if a spark can be made to occur in the cylinder about to fire. To obtain this spark independently of the timer, which is only operated as the inductor shaft turns, a push button is provided on the switch. Pushing this button when the switch is on the battery position causes the current to flow through the primary winding; when the button is released, it interrupts the passage of electricity in the same manner as though the points of the timer were separated by the cam.

Remy Wiring Diagrams.

A diagram showing the Remy dual system for two-cylinder motors is given at Fig. 4 with all parts clearly shown, while that at Fig. 5 depicts its application to four-cylinder power plants. It will be noted that in the two-cylinder motor the distributor is omitted, the spark plugs being connected in series. This is done by connecting a terminal of the high-tension winding to each plug instead of grounding one of the secondary leads as when a distributor is employed. The metal of the engine forms the connection between the two plugs. Sparks occur in both cylinders at the same time, but as one of them is filled with burnt gas when the other is being ignited, the spark is utilized only in the cylinder full of fresh, compressed gas. Although the two sparks occur only once during each revolution of the crankshaft it is customary to run the inductor of the magneto at crankshaft speed and use a form of cam that breaks the circuit once instead of twice each revolution. The higher rotative speed means a higher electromotive force in the stationary coil because of the greater number of times the lines of magnetic flux are reversed through the coil. The connections and method of operation of the four-cylinder system are obvious.

How Spark Time Is Varied.

The spark is advanced and retarded by rocking the circuit breaker housing about the axis of the inductor shaft by means of a rod and lever connection with the spark control lever on the steering wheel. By shifting the timer case in this manner, the time of sparking relative to the crankshaft and inductor position can be varied. If the casing be moved in the direction of rotation the cam will have to move further before it interrupts the current and the spark time is retarded. On the other hand, if the contact breaker housing be advanced in a direction opposite to that of the inductor shaft movement, the cam opens the circuit sooner and the ignition of the charge is started earlier.

Operation of Splitdorf Magneto.

The model B Splitdorf magneto is a very popular type that embodies the separate transformer coil prin-

ciple. The construction of the various parts and their relation to each other is very well defined in the sectional view at Fig. 6. The armature, which has a single winding of comparatively coarse wire is supported on annular ball bearings, and revolves in the magnetic field produced by the permanent horseshoe magnets. One end of the armature winding is grounded, the other is coupled to a conducting plug that passes through the contact breaker end of the armature shaft, but which is insulated from it. Wire gauze brushes are mounted in the contact maker cover and bear against the conducting plug to take the primary current generated in the armature winding to the transformer coil.

The principal parts of the timer are shown at Figs. 8 and 10. This consists of a cam, mounted on and driven by the armature shaft which is used to raise the contact lever and interrupt the circuit between the platinum points at those intervals when the armature is in the position of maximum current production and it is desired to induce a high-tension current in the primary coil of the transformer.

The distributor is mounted inside the magnets, above the armature and is driven from the armature shaft by gearing. This consists of a plate of insulating material carrying a contact segment, and the shaft on which it is mounted revolves on annular ball bearings of the same type as those used to support the armature. The current from the high-tension lead of the coil is supplied to the central brush of the distributor, which bears against the distributing segment, this in turn making contact with the brushes leading to the spark plugs.

Principles of Splitdorf Ignition System.

The general principles involved in the Splitdorf system can be clearly understood by reference to Fig. 7, which is a diagram showing the wiring and the relation of the various components of the ignition group to each other, though these are not depicted in the exact positions they occupy in actual application. With the switch lever in the position shown, and the contact points of the timer making an electrical connection any current generated in the armature winding is short circuited and flows through a limited circuit formed by the wire A, the switch bar, then from the centre of this to the contact 2, thence to the contact points, the ground and back to the armature winding.

When the contact points are separated by the lift of the cam point, the current must then flow from the armature, through the conductor A, through the switch bar to the contact at the other end, which leads to the primary coil, and after passing through this and energizing the core, it returns by way of the ground to the armature winding. As soon as a connection is re-established between the contact points, the current from the armature is again short circuited and cannot pass through the transformer primary coil. The high-tension current path is easily followed.

If the position of the switch blade be reversed, so it is in contact with terminals 2 and B, the battery current instead of the magneto energy is interrupted by the contact points. The current path is then defined by the conductor leading from the battery to terminal B, through the switch bar to the terminal 2, thence to the contact points as long as they are together and through the ground to the primary coil from which it returns to the battery over the conductor leading from the extremity of the primary coil to the batteries. As soon as the points separate, the im-

pulse of higher potential is induced in the secondary coil because of the sudden demagnetization of the primary coil core. At this moment, the metal distributing segment is in contact with one of the brushes connected with the spark plugs and the spark occurs in the cylinder desired. When the switch lever is in a neutral position, all circuits are open and current cannot flow to the transformer winding.

The method of wiring followed with a two-cylinder engine is shown at Fig. 8, that at Fig. 9 shows the arrangement of conductors when the system is fitted to a four-cylinder motor. The position of the distributor brush, the armature, the cam and the contact points when the timer case is rocked to obtain maximum advance is clearly shown at Fig. 10. At this moment, the cam is about to raise the lever carrying the contact point from the platinum tipped screw, and thus interrupt the short circuit existing in the armature winding so the electricity in the armature can flow through and energize the primary winding of the transformer coil as previously outlined.

The Eisemann Transformer System.

The principal element of the Eisemann dual system is the current producer, which is shown in section at Fig. 11. In this, the magnetic field is produced by either two or three pairs of permanent magnets, depending upon the type of magneto. The E U shown has but two pairs, the type A has three sets. The armature is of soft iron, of the conventional H section and carries the usual single winding of copper wire. One of the ends is connected to the body of the armature, thus being grounded, the other is coupled to the insulated copper bolt coming out of the armature shaft on the contact breaker end. A carbon brush pressing on the head of this bolt collects the current produced in the armature. The contact breaker is similar in construction and operation to those previously described. The distributor is driven by spur gearing, and the shaft to which the distributing contact is attached is mounted on plain bearings. The armature shaft revolves on annular ball bearings. The revolving member or distributing brush makes contact with a series of metal segments imbedded in the insulating block that forms the base of the distributing arrangement.

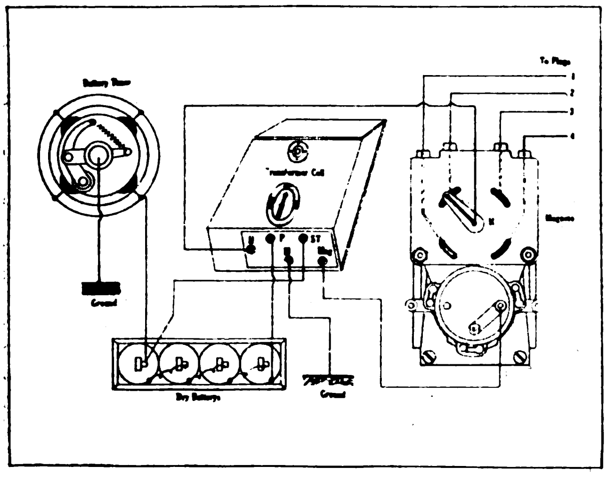

Fig. 13—Eisemann-Carpentier Dual System.

The regular Eisemann system with battery auxiliary is shown at Fig. 12 with all connections clearly defined. The principles involved are practically the same as in the system previously considered, a transformer coil that is suitable for battery current as well as magneto energy being used.

The Eisemann-Carpentier dual system, outlined at Fig. 13, is especially devised for those desiring to have a battery system that is independent of the magneto timer or coil. In this, the battery current is commuted by a separate timer, while a double unit coil is supplied. The high-tension distributor of the magneto is utilized to deliver the secondary current of both coils. One unit of the coil is a plain form designed for use only with the magneto, the other is a vibrator element designed to use battery energy. A single switch, which is part of the coil, controls both systems. A push button on the face of the coil enables one to start the motor without preliminary cranking if the cylinders are properly supplied with compressed gas. Pushing this button, short circuits the battery current through the vibrator coil without it having to pass through the timer, and the distributor segment supplies the cylinder that is about to fire with the necessary spark.

(To Be Continued.)

STARTING SMALL SCREWS.

There are a number of places in the automobile where small machine and other types of screws are utilized. Holding these while inserting into the work is often difficult. There are several methods, among which is the use of a small wire, bent double at one end, and slipped under the head of the screw. This serves to hold it steady, while the screw driver is manipulated.

A second way is to cut a V slot in a small strip of tin. This is, perhaps, the best as it will take different sizes. A third plan is to take a piece of stiff paper and push the screw through it.

Where the above devices cannot be employed a piece of wood, trimmed to fit tightly in the slot in the head of the screw, is driven in hard. This will enable the operator to catch the thread after which the ordinary screw driver is used. Iron or steel screws of small dimensions can be held by rubbing the head of the tool over one pole of a horseshoe magnet.

EMERGENCY VALVE KEY.

While in the majority of motor cars the engine is fitted with mechanically operated valves some utilize an automatic intake. These sometimes occasion trouble by the cotter or valve holding member breaking. Usually these drop into the cylinder and cannot be recovered easily while on the road. An emergency repair in such an event is to take a nut that will slide over the valve stem and file a slot in such manner that it is deeper in the centre than at the edges. This can be accomplished with a thin, flat tool. A cotter pin is then cut in half and inserted through the hole in the stem. The recess will prevent the nut from turning as well as eliminate the tendency of the pin to shear off.

TIGHTENING LOOSE BALL RACES.

Ball races should have a tight fit, but sometimes these work loose. This can be remedied by knurling the surface of the shaft or container where the former is hardened. An alternate method is suggested by a repairman and consists of tinning the shaft after knurling, as the former process fills the small indentations and also serves to keep the oil from working into the channels. Warming the two parts, it is claimed, will unite them much better and a joint thus made will not shift.

FOOTBOARD COVERINGS.

An owner whose car was fitted with rubber matting desired to replace the worn material and found that the pyramid form was rather costly. Having some first class linoleum of a neat pattern, he proceeded to cut and fit it to the footboards of the machine. It gave excellent service as it was cleaned easily and was not affected by oil or dirt.

SYSTEM IN THE CARE OF STOCK.

One of the greatest needs in the average store for the sale of accessories and supplies is systematic care and arrangement of the stock. While desirable it is not necessary that particular endeavor be made toward display as an article can be shown in the box or case. It is imperative, however, that the customer be exhibited something clean and fresh in every respect, for nothing will more quickly discourage a prospective purchaser than badly kept stock.

There is a far greater loss possible through neglect than is generally believed and were there accurate knowledge of the sales where the profit was partly or wholly shrunk because of ordinary inattention to stock, which could be insured against by the exercise of common sense, the amount would surprise the owner or manager of the average business.

That the subject is not given more attention is because the volume of loss is unknown. When the number of places of business is known—there are thousands of them—it can be realized that the aggregate is considerable with each. Here is an admirable opportunity for reform.

SELLING ACCESSORIES FOR ALL CARS.

The makes of cars in existence are numbered by hundreds, and there may be in all many more than 1000 different models in existence. These figures are low instead of excessive. Accessories and articles of equipment are produced in many instances with a view of installation on any car, but frequently special fittings are necessary that an accessory may be utilized. This condition necessitates a very broad knowledge of cars by the dealer or his salesmen, a character of information that is especially valuable and may be utilized to distinct gain in business dealings every day. There are few books of reference that can supply such facts. Comparisons of catalogues of any one make of car for several years will indicate material changes, but few, if any, will give the data necessary for the benefit of the customer. While personal experience may be helpful with some articles it must of necessity be limited. The manufacturers of the accessories may be even less informed than their representatives. Were it possible to collate such information it would meet with ready sale; but it appears impossible to secure it in anything like uniform completeness.

GARAGE SERVICE CHARGES.

With most garages there is a scale of charges for dead storage and another for live storage. The one merely calls for shelter of the vehicle and protection against damage or theft. The other includes in addition washing whenever used, or daily if required, with polishing and the other necessary cleaning, and in some instances locker room or other form of storage. The first class gives the customer exactly what he pays for. The other may include a patron whose work costs more than he is charged, and another whose requirements are exceedingly moderate. To exact a fixed charge for such service is to take an excess from the second and to give it to the first. There appears to be no better method of meeting the condition than by making a fixed charge for storage and others for additional service, which would cause each customer to pay for what he received and would allow a reasonable margin of profit for the garage. The equity of the proposition ought to appeal to all persons, either garage manager or motorists.

POWER WAGON SERVICE.

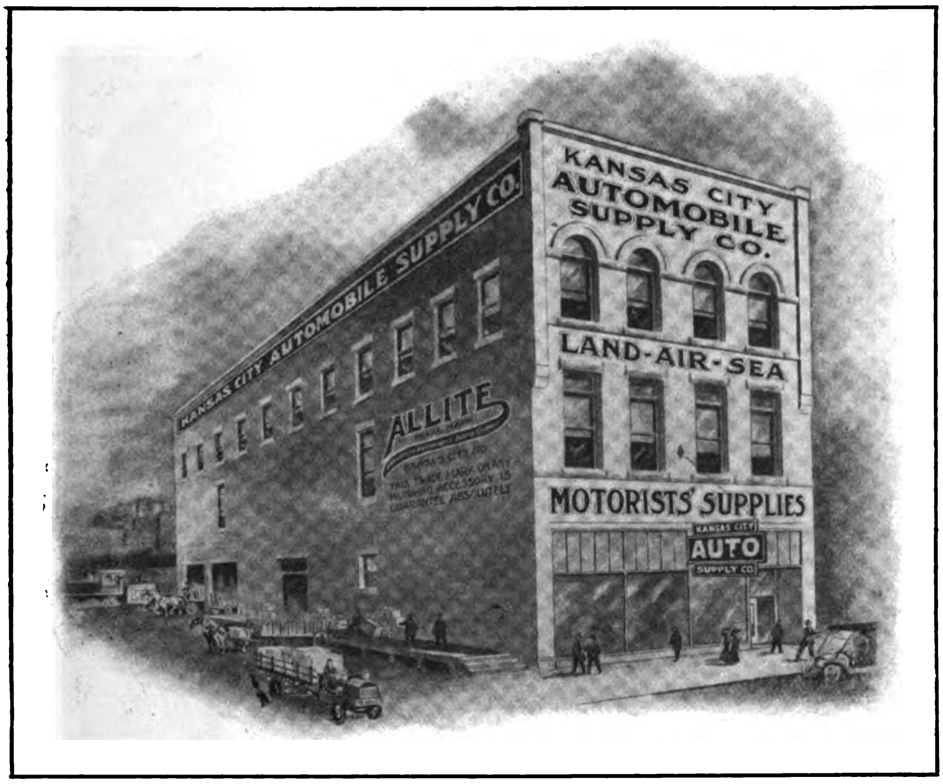
It is entirely practicable for the owner of several service wagons, who does not have a sufficient equipment to justify an exclusive garage organization, and who requires the use of his vehicles constantly, to make provision for attention and maintenance with a reputable garage at reasonable expense. It is not meant that such service would be as economical as were it controlled by the owner, or operated jointly with another, but it would give practical results and certainty of attention. The extravagance of cheap labor is never more emphasized than in operating motor vehicles, and thorough inspection at least once a week and an examination of the mechanism each night (not necessarily minute) and a test of the clutch, transmission and brakes, can be said to be worth all it would cost. Neglect, generally through incompetence, is the worst enemy of the service vehicle. It is cheaper to pay for attention and have the machine in condition for use than to pay more for repairs and rent another wagon during the period of restoration.

MARKETING AUTO ACCESSORIES BY SYSTEM.

Methods Created and Developed by a Large Western Enterprise to Serve a Demand by Long Distance Buyers for Quick Delivery, and Proven to Safeguard All Interests and to Insure Complete Satisfaction.

EVERY industrial and commercial interest studies the "market," which is the opportunity to buy or sell afforded to all people. In buying and selling there are certain business principles that may be universally applied. Systems, methods and conditions differ the world over. It may be assumed that business as transacted by any nation is uniform, but this is far from the fact, and it cannot better be demonstrated than by a contrast of enterprises in two different sections of the United States.

In the East the commercial centres are close together. In these, often but a few miles separated, any person can procure whatever may be desired. This statement is of the rule, to which exception may be made in rare instances. The purchaser can have practically anything delivered at very brief notice; or submitted for inspection. Or, examination can be made without loss of time.



KANSAS CITY AUTOMOBILE SUPPLY CO.
KANSAS CITY AUTOMOBILE SUPPLY CO.
LAND-AIR-SEA
ALLITE
MOTORISTS' SUPPLIES
KANSAS CITY
AUTO
SUPPLY CO.

Main Building Occupied by a Pioneer Enterprise That Is One of the Largest Motor Accessory Houses in America.

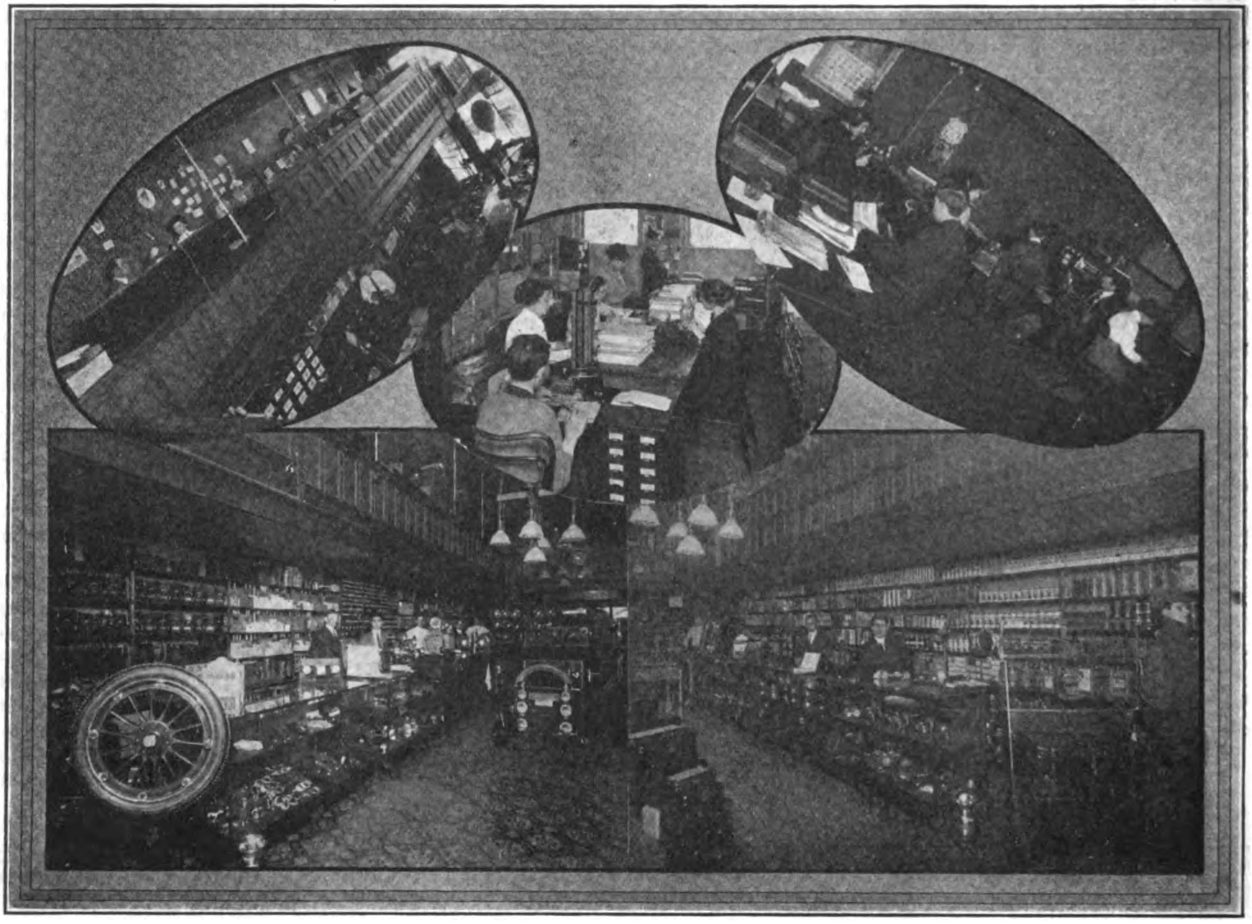
In the West conditions are diametrically opposed. Areas of many thousands of square miles, several states in some instances, are tributary to a commercial centre from which order must be made largely by mail. Shipment is dependent upon the express company or railroad freight. In the East quick delivery is the rule and it must be provided. In the West it is a special service that may mean sending goods hundreds of miles. In the East the buyer generally can make his own selection and he can contrast the best the market affords. In the West he often must choose from a catalogue and trust to the judgment of the house with which he is dealing.

Commercial centres cannot be judged by population. The western method of doing business has been continuance of custom that was begun when the original points were selected by convenience or necessity. This was the cause for the growth of Chicago, St. Louis, Minneapolis, St. Paul, Kansas City, Omaha, Denver, and cities of lesser proportions. No better understanding can be had than by a study of the financial statements by sections and by states. One of the most striking illustrations is the State of Missouri, which transacts more business than any financial centre outside of New York and Chicago, and while Kansas City is 17th in population according to the last census its weekly bank clearings are exceeded only by five cities of the nation. This means that the city is a point of distribution of vast importance. For years it has been the leading commercial centre for farming implements and it has become prominent as a place of distribution for motor vehicles. The enthusiasm of the farmers in good road development and the promotion of the movement by political influence is a certain indication that the agriculturists are becoming more and more independent of the railroads and that there is almost unlimited possibilities for the future in this and similar fields for the automobile and allied interests. It can be said with truth that the farmers now fully realize that the greatest tax in transportation is between their farms and the shipping point, and this is the problem that they must solve.

It is apparent that the business methods generally adopted are not changed to meet any one requirement and this applies equally well to the automobile industry and trade. To serve the very large population tributary to Kansas City it is necessary first of all to have unusual means for publicity and delivery. An admirable illustration of the manner of meeting the requirements is shown by the facilities of the Kansas City Automobile Supply Company, which in the 12 years it has existed has become one of the largest houses of the kind in the West, and is regarded as one of the leading enterprises in the country.

The establishment was the outcome of the endeavors of two prospering bicycle pioneers of Nebraska who removed to Omaha against the advice and counsel of business friends and bankers. After deliberating the possibilities, the business was divided and one interest located at Kansas City, this being the manner of meeting the uncertain development of the country. No matter which city prospered the business was established. After adjusting the affairs to the local conditions these two men, in the opinion of their friends and bankers, became commercial suicides when they were made agents for Locomobiles, for which John Brisbane Walker was responsible as head of the Locomobile Company of America.

The demand for motor cars was nothing and promoting the sale of the machines against prejudice and ignorance necessitated work and required courage seldom needed in coping with business development. When the tide turned it was so overwhelmingly in favor of the Kansas City branch that the Omaha store was given over and the enterprises were consolidated. It was in 1905, when the utility of the automobile became firmly established, that the sale of cars was abandoned and the business was organized into the Kansas City Automobile Supply Company, to deal entirely with motor car accessories. Its dealings are not alone with the United States, but extend to foreign countries as well.



Retail Store and Offices of the Kansas City Automobile Supply Company: Upper Left, a View from the Mezzanine Platform, Showing Separate Cashier and Bookkeeping Divisions. Upper Right, a Corner of Main Office Where the Correspondence Is Answered by Dictators, Phonographs and Typewriters. Centre, Process Letter, "Auto-log" Mailing and Addressograph Department, Whence Literature Is Sent Out the Year Round. Lower Views Show Both Sides of Local Salesrooms.

The concern's magnitude may be judged from the buildings it occupies. In addition to the main structure several warehouses are utilized for the storage of stock. The shipping department is very large and is specially adapted for the work, this being one of the most important divisions of the business. The store is centrally located in the automobile district at 15th street and Grand avenue, the front of the first floor being given over to the retail trade, while the remainder of the structure is utilized for the wholesale distribution. All incoming goods are received either in carload lots from the railroad spur or from the freighting trucks at the rear of the store.

The basement is used for storage, one-half being for oils and greases, a travelling crane and hoist being employed in storing and removal for shipment. The other half of the basement is fitted for the stock of tires, bins being used to separate varying makes of shoes and tubes. The entire second floor is the shipping department, a portion of which is shown in an illustration.

To meet the hurried demands for automobile supplies with prompt service goods are necessarily stocked in unusually large quantities. The system of shipping is with a view of handling all orders the day they are received, and to facilitate packing, shelving has been installed in the shipping room as shown herewith, this being filled with the smaller accessories in greatest demand. The packing tables are built with tops of two-inch plank to endure hard usage and preparing boxes and crates for shipping. These tables are built so the clerks may work at either side and are divided longitudinally by a board. Each side is divided as desired by boards fitted with metal catches which engage the centre board and are held firmly.

With these movable partition boards the table surface may be divided to give any desired spaces and keep all articles in a given section apart from the other orders. As the orders are placed on the table, each in a space by itself, the articles are checked by the clerk, after which the whole is inspected by the chief shipping clerk, an expert mechanic who knows the use of every part or accessory, who double-checks it and then orders the packing. To keep up the stock in the shipping room is the duty of several stock clerks, who draw upon the warehouses as necessary to maintain a standard of supply.

The business of the company is drawn from an exceedingly wide territory, the area extending far beyond the section for which Kansas City is the commercial centre. This necessitates a correspondence division that is proportionate to the volume of mail received and sent out, and naturally this must have re-

View of the Long Double Shipping Bench on Which the Smaller Orders Are Laid Out, Boxed and Packed.

sources and facilities that will enable it to keep pace with any requirements. The system the vogue was carefully developed and perfected with experience, the main purpose being to insure against error in record or shipment and to satisfy all possible demands made with the simplest forms.

Every piece of mail received is marked with a time clock stamp that indicates the minute of the date it was stamped, this being assumed as the precise time of receipt. It is stamped the second time and this stamped form is filled in, as the letter is given attention. First record is made showing by whom it was received, the amount of the enclosure and whether it was a draft, money order or check. Then the stamp provides for three references, showing to whom the letter was referred and by whom the attention necessary in one, two or three departments was given. When the form is filled in and the letter is filed the record is complete so far as the office correspondence is concerned.

Assuming an example: An order is received and is given attention as stated above. The order is copied in quadruplicate, which insures against error, minimizes clerical work and preserves absolutely the form of record. This order form is very carefully designed and contains every item that is desirable or necessary. The form blank is cut for loose leaf binding and the blanks are with four separate sheets, the first of which is golden rod in color, the second yellow, the third pink and the fourth white. These are 11x7 inches and are written with typewriter and carbon copying sheets. The first, or original, sheet and the second sheet, after the copying, are retained in the office by the bill clerk, and the third and fourth sheets go to the shipping department to the clerk in charge. The third or pink sheet is the actual shipping record and as the order is made up the articles as placed on the shipping bench are checked by the clerk in the first column at the left of the items on the blank. When the chief shipping clerk checks the order he does so in the second column and he confirms or corrects the order as made up. It will be seen that the record establishes who fixes the prices, who assembles the order, who checks it, and who packs it. No order can be packed unless ordered by the chief shipping clerk and his O. K. has been given. When the order is packed, but not closed, the fourth sheet or packing ticket is separated by perforations so that the heading, the shipping direction and the address of the buyer may be pasted on the package or case, this

Section of Stock Room, Showing Shelves from Which Rush Orders Are Filled for the Smaller Express and Mail Shipments.

taking the place of the usual marking and guarding against error by the clerk or illegible marking. The remainder of the fourth sheet is placed in the package and sent with the goods, so that the customer on receipt of the shipment can check the items of the order and fix the prices without waiting for the bill, as well as verifying the character and quality of the articles.

With the shipment of the order the pink or order sheet is returned to the bill clerk and it is assembled with the other two. The prices are extended on all three sheets and of these the first, or original is the invoice, which is mailed to the customer. The second, or yellow blank, is filed directly into a loose leaf ledger this saving the time that would be required to post such an account. The order sheet, from which the order was made up, is filed for record.

The four blanks making up the order form are shown to illustrate the completeness of the record. The first and second are identical save in the heading and that the second is to receive the folio number of the ledger, which number is also given to the third, or order sheet. At the bottom of the order sheet is a note "Items marked 'X' to be back ordered, those marked 'O' not in stock today." At the bottom of the fourth or packing ticket is the note, "Packing ticket from Kansas City Automobile Supply Company, Kansas City, Mo." The difference between the first or invoice sheet, and the instruction to the customer on the packing ticket is apparent. No other condition or requirement appears on the other two tickets.

Order Blank of Four Sheets, Copied in Quadruplicate, the First, Shown in Full, Being the Original, and Serves as an Invoice When Extended. The Second Is the Loose Ledger Sheet After Prices Are Extended. The Third Is the Order Sheet for the Shipping Department, Checked with the Order as Packed and Sent Out, and Filed for Record. The Fourth Is the Packing Ticket, the Heading of Which Serves as a Label, and the Remainder Is Packed with the Shipment. Order of Sheets Is from Bottom to Top. Size 11x7 Inches.

So the returned goods may receive the necessary attention a blank is made out in triplicate, these being in blue, yellow and white, the original being blue. The second has a head note, "Attach this to Goods Returned," and a foot note "All repairs, either for our stock or customer, must be attended to AT ONCE, as any article broken or in only a partial state of repair is USELESS and A LOSS to this concern or its customers." The third has a head note, "This blank to be filed by stock clerk."

As money enclosures are received in the mail a check slip is attached that specifies the form of remittance, the amount, the account, the name and address, with the date, which is to insure against possible delay in handling the order. These slips are filed for record with the orders. With such transactions it is not necessary to carry a ledger account other than to show that the transaction has been closed and as a reference in the event of claim for credit.

All credit memoranda are made out in duplicate, one copy of which is sent to the customer and the other is preserved for office record.

All local sales that are charged are made on a form in duplicate, the purchaser signing each charge as it is made. The bill passes through the billing department and is mailed to the customer, so that each day he will know what has been bought by his authority, and will have a statement of each transaction as made. The copy of the bill is kept for record.

The secret of the success of this business undoubtedly is its system of conducting correspondence. It is an absolute requirement that a letter be answered the same day it is received, it being held that when a customer writes he has reason for so doing and desires quick response. To keep up the correspondence a large battery of typewriters is kept busy during business hours. To economize time of dictators and stenographers phonographs are used, as is illustrated, each dictator answering letters immediately upon receipt while the stenographers can be constantly engaged without interruption by simply changing the

phonograph records. Even in sealing the envelopes to insure exact and perfect work high speed machinery is employed.

The circular and catalogue department as presented herewith is separate and distinct from the main office. Here is mailed all the literature that is distributed. The department has perfected mailing machines that will turn out 2000 addresses an hour, and others that produce circular letters, etc. The company has no printing establishment of its own as yet, despite the volume of its work. The catalogue is issued annually and is protected in its name of "Autolog" by copyright. This volume consists of more than 200 pages of illustrations, descriptions and quotations of prices on accessories for every form of land, air or sea craft, and it includes as well a fund of information that is valuable to every person, in that it explains simple formulae for computing horsepower, gradients, speeds; the metric system and the English equivalents; proper use and care of tires; methods for tempering, brazing and hardening steels and other metals; how to remove tarnish; how to prevent and remove rust, etc. The "Autolog" is mailed free at request in which is stated the kind of motor the applicant is using.

In purchasing the company is a liberal patron of all leading manufacturers and sales agents and a product new in the market is often submitted for opinion as to its probable success. Buying in large quantities and for cash the customer is given the advantage of the lowest prices that can be established. Every customer is impressed with the policy of satisfaction or the refunding of the price paid. The men who established the first motor car business and the first exclusive accessory house in the entire West are actively interested in directing the company and they have associated with them men who are equally anxious to further develop the field, now so well cultivated.

The purchasing is done by one of the organizers of the company who is careful never to take on any line that will not yield the customer full value for the price paid. This care in selection of stock and the financial responsibility of the concern has given it prestige and impelled the confidence of the motoring element of the section in which it does business. The members of the company are emphatic in their belief that the "square deal" has been the best and surest foundation on which they could have builded. This has been demonstrated practically in many instances where orders have been received and the judgment of the house depended upon entirely.

TIGHTENING WOBBLING REAR WHEEL.

A small, low priced runabout came into the garage one day with a rear wheel so loose on the axle that when it was jacked up it displayed an enormous amount of side shake. The axle was fitted with a long, square key to drive the wheel. This was prevented from coming off by a .375-inch pin through the hub and shaft, which were both so badly worn that new members seemed almost necessary, but after looking the job over a method of repair was evolved.

The shaft was turned down .0625 inch for the length of the hub. The latter was removed from the wheel and bored out the same amount, leaving room for a .125-inch bushing. This was made from steel tubing and brazed into the hub. The keyway was cut through the bushing to coincide with that in the hub, the one in the shaft deepened, and both widened to fit a new key. Then the wheel was assembled, placed on the axle, the pinhole drilled through the bushing, reamed, and a new pin driven in, after which the whole was as firm as when new.

CLEANING SHELLAC BRUSHES.

A shellac brush may be cleansed readily and easily in soap and water if it be taken in time and the work done quickly, before the shellac has had time to set. Alcohol is generally used for this purpose because of its cutting action on the gum, which is the principal ingredient.

DETECTING LEAKS IN FUEL TANK.

Minute leaks of the fuel tank are hard to locate because the gasoline evaporates so quickly and the amount is too small to detect readily with the naked eye. Where one is thought to exist it can be located by mixing a quantity of cylinder oil with the fuel. This will remain upon the metal near the hole.

PRACTICAL GARAGE ACCOUNTING.

System Created For a Four Department Automobile Business That Stopped Shrinkage and Loss and Gave Accurate Knowledge of the Transactions in Each Division, Showing Fixed Charges, Gross and Net Profits.

THAT the application of system in the administration of the public service station will result in substantial saving and improvement of attention to patrons is certain. In selecting a method to be adapted, that having the least complications and which will yield results is to be preferred. Theory is well enough but the average man desires to know what has been accomplished, and to give this character of information, detail has been sought that has been applied and has been employed for a sufficient length of time to justify a recommendation of its use.

The following system was developed and applied to a garage service in a city of moderate proportions. This business was conducted for several years in much the same manner as are hundreds of others. The transactions had justified development and the investment of capital, but with the best of facilities for service of every kind and a location that attracted a relatively large volume of transient patronage the net return was not satisfactory. The actual loss was apparent and the creation of rules made no material change. It was believed that there was a much greater earning power than was indicated by the balance sheets, and that there was shrinkage was obvious.

With a purpose to absolutely fix responsibility and to keep certain record of every department and transaction analysis was made and the system below was developed. It has proven to be satisfactory in every way.

The business is divided into sales, supplies, garage and repair departments. Each is conducted as though it were entirely independent and each must be made reasonably profitable. In the bookkeeping each department is apportioned its share of fixed charges, which include rent, interest, light, power, water, heat, advertising, office expense and salaries. This apportionment is an approximation based on the expense of the previous year, averaged for each month and for each item. At the expiration of any given month the actual expense can be compared with the average, or with any previous or corresponding month. Any material change can be a reason for inquiry and adjustment, if this be necessary. This insures against any continuance of a loss.

Each month a summary is made which includes 13 totals of items. The first column is that of the cash revenue from storage of cars, labor, battery charging, and sale of gasoline, oil, tires, parts, accessories and cars; the second, of charges made of similar transactions; the third is the total revenue from each source, which ought to equal the totals of the first two columns; the fourth shows the expenditure charged against each item; the fifth, the difference between the receipts as shown in the third column and the expense as shown in the fourth. These totals, the third, fourth and fifth, show gross and net revenue and expense, which is applied to the entire business. The sales, supplies, garage and repair departments each then are shown in four additional columns by receipts and expenditures as indicated by the items of revenue in the first five columns, the footings giving the total receipts and expenses for each department. The combined footings should equal the totals of gross revenue and expense, and the difference between the two should be as shown by the net total revenue. With this statement of revenue and expense the average of fixed charge for each department may be contrasted, and the proportion for each determined. Comparison with any previous month may then be made and the difference in actual figures or with the average of fixed charge is indicated. The condition of each department is shown beyond question.

	Cash Sales	Charge Sales	Total Sales	Cost	Net Receipts	Sales		Supplies		Garage		Repairs	
						Dr.	Cr.	Dr.	Cr.	Dr.	Cr.	Dr.	Cr.
Storage	$100	$150	$200	$50	$200					$250	$50

	$8,415	$500	$8915	$6,935	$1980	$7,200	$5965	$620	$395	$420	$185	$675	$390
Gross Earnings							1235		225		235		285
Payroll							100		40		100		75
Charges (Approximate)							350		80		65		130
Net Profit							$765		$105		$70		$80

Example of Summary Sheet, Showing Transactions, with Cost, Gross and Net Receipts, for Each Department and for the Entire Business, the Fixed Charges and the Net Profits, for a Combination Agency and Garage.

That the summary may be understood, a form has been filled out as illustration, but the figures must not be understood as being anything more than an example. It should be stated that item "sale of cars" indicates merely the difference between the cost and the selling price. When the summary has been made and the gross earnings have been obtained the payroll of and the averaged fixed charge for each department is deducted, which gives the net profit for each separate division of the business. It is then possible to ascertain where there is loss or shrinkage.

In connection with the use of this sheet it must be realized that the condition of the stock is in one sense a potent factor, and in another it is not. To illustrate: All charges are made on the basis of the selling price and the cost at invoice or inventory valuation so far as stock is concerned. The stock record shows the condition, shrinkage or increase, so far as relates to capital invested in stock, but at the other hand this has no bearing on the volume of business, because the profit is based on the actual transactions and whether the stock be large or small this is taken care of in the item of fixed charges. However, the net profit of the department ought to have a definite relation to the fixed charges.

It will be seen that it is possible each month to give summary of the volume of business transacted, department volume of business, the total revenue and the department revenue, the total expense and the department expense, the department fixed charge, and department incidental expense and renewal expense.

In the garage department the sale of oil, gasoline, waste, carbide, grease, and the like, and the storage, washing and polishing, are sources of revenue. The labor and the parts sold are credited to the repair department; the sale of tires and accessories, to the supplies department, and the sale of cars, to the sales department.

In the bookkeeping there is a ledger account for each department, and in this is charged all the expense for each division. To the credit is placed all the earnings. The balance indicates the profit or loss. The sales for each day are posted to the credit of the department, but in the sales department total sales and the total cost are the principal items of record. In the sales department the demonstration expense, telephone and telegraph charges, railroad fares, time of the drivers in receiving or delivering cars, oil, grease, waste, carbide, labor, adjustments, repairs, etc., are all charged to the department in addition to the proportion of the fixed charge, and the difference between the selling price and the total expense is the net profit. An account is opened with each car in the ledger and the charges for expense are made at cost or an approximation that is very close.

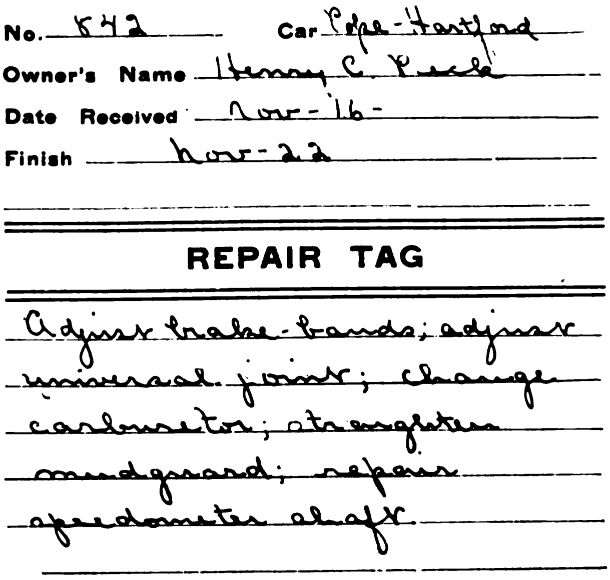
Form 1, Storage Tag.

The conduct of the business is to be approved in that there is endeavor made to attract attention to every service. The accessory department is large and well lighted. There is a large window where display is made and changed weekly. Standard and special stock is shown. All the goods are protected by cases from handling and from dust. Where it is possible the stock is tagged and marked plainly, these tags being turned into the cash register when a sale is made, this giving information for replenishment orders and where factory and order number are essential these are placed on the tags. This makes possible frequent ordering and the maintenance of the stock to the desired volume.

In the garage all sales are recorded by sales slips with carbon copies so as to indicate both cash and charge transactions. The gasoline is distributed to the cars by a portable tank with meter and this meter must coincide with that of the main supply tank, as well as with the slips by which the sales are recorded. The oil in bulk is kept in a battery of pump tanks while the oil in cans, grease, waste, carbide is kept in a storeroom under lock and key and is in charge of the head of the accessory and supply department.



No. 842 Car Pope-Hartford

Owner's Name Henry C. Peck

Date Received Nov-16-

Finish Nov-22

REPAIR TAG

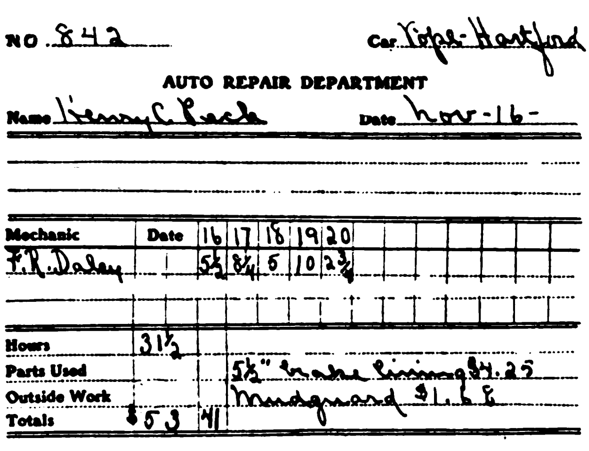
Adjust brake-bands; adjust universal joint; change carburetor; straighten mudguard; repair speedometer shaft.

Form 2, Repair Tag, Reverse of Storage Tag.

The tires, gas tanks and the special preparations prepared for sale under the name of the garage, as well as the stock that cannot be kept in the salesroom, are kept in a large storeroom, the tires being arranged as to makes and sizes, each article being in bins or compartments or on shelving.

As to the record of service: In the event of a transient customer the storage tag as shown at Form 2 is filled out and attached to the car. This specifies the character of service and against each item is placed the charge and the total is then made. When the car is delivered to the owner the tag is removed and the cash payment is shown by the sales slip, a copy of which or a receipt, as may be desired, is given the owner or driver.

Should repair be needed the reverse of the storage tag is filled in with the identification and the necessary instruction. This done the car is turned over to the superintendent for his attention. This tag is designated as Form 3. When the car is received by the foreman of the repair department a record is begun that is continued with the different stages of the work, this being on a form on which the original instruction is transcribed with such additional detail as



NO. 842 Car Pope-Hartford

AUTO REPAIR DEPARTMENT

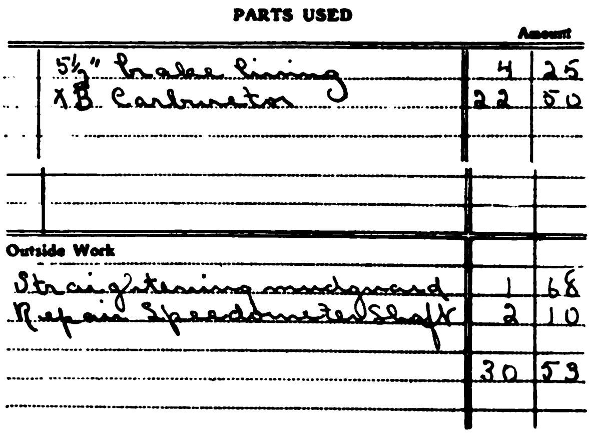
Name Henry C. Peck Date Nov-16-

Mechanic	Date	16	17	18	19	20
F. R. Daley		5½	8¼	5	10	2¾

Hours	31½		
Parts Used			5½" brake lining $4.25
Outside Work			Mudguard $1.65
Totals	$53	41	

Form 3, Foreman's Record, Both Sides of Card.

is necessary to describe the attention to be given. This is shown as Form 3 and on it is noted the name of the mechanic, the dates and the number of hours of work each day. On the reverse of the form the record is continued under a summary which includes the hours of labor, every component supplied from the stock room under "parts used," and "outside work," which defines whatever may not have been within the facilities of the garage shop. This also indicates the total number of hours of labor, value of parts used and of outside work, together with a total for each day and for the entire job, when the record is returned to the office with the notification that the car is ready for delivery. This record is compiled by the foreman on the blank indicated as Form 3.



PARTS USED

	Amount	
5½" brake lining	4	25
XB Carburetor	22	50
Outside Work		
Straightening mudguard	1	68
Repair Speedometer Shaft	2	10
	30	53

Form 4, Reverse of Form 3.

Each workman keeps account of his time under the direction of the foreman and each day the time cards are collected and sent to the office. The cards are grouped with reference to each job of work and these must coincide with the record of the foreman. The form of time card is shown as Form 5. The repair blank as completed is a bill in itself, from which the bill is made up and passed upon before being sent to the customer. If the bill is paid immediately this is recorded by the sales slip, a copy of which is given as a voucher with the receipted bill, there being two records for the customer and the office instead of but one. The form of the sales slip is seen as Form 6.

With the cars in live storage a sales slip is made out with each replenishment of the tanks or supply furnished, and as these are sorted and filed in order and charges are made from them daily, any inattention may be established without question. A gasoline and oil schedule with account for every day of the month is made out for each car, and entry is made on the schedule whenever the tanks are filled. This is original and is kept on file, it being a check on the sales, but a copy is sent to the owner for verification of the items entered on the bill. This shows gasoline in gallons, cylinder, high speed, and gearcase oil in quarts with incidentals and the total value. From these slips the charges are made monthly. Where the business has cars in the garage or work is being performed on them storage or any other item of expense is charged at cost, as has been stated. A specialty is made of repair work on the cars for which the business is agent.

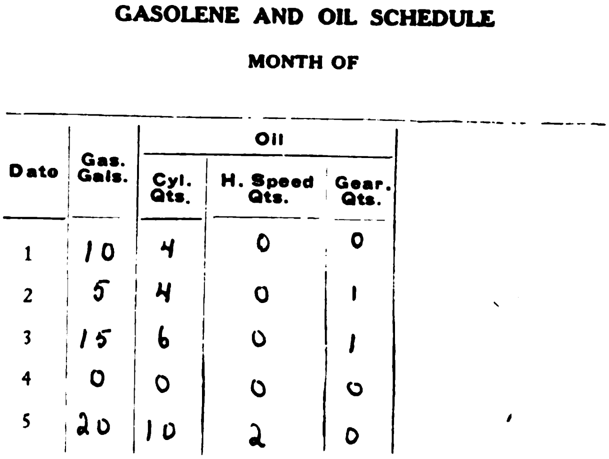
Form 6, Sales Slip.

All of the owners of cars stored are required to keep their property in lockers, and no responsibility for private property is assumed. It is held that accountability and responsibility are imperative and that it is best to keep the cars of transients under lock and key where they cannot be reached even by the owner or driver without the knowledge and presence of the superintendent of the garage. Care has been taken in the employment of help to select as good men as can be found and pay good wages, for when men value their employment there is less possibility of visitations by their friends, the unprotected property being an attraction. The installation of a system also insures against loss or shinkage in the stock room. No commissions are given to drivers and it has been the experience that this attitude has the approval of the owners. There has been no reaction because of this policy.

STICKING GASKETS.

Where asbestos and some other materials are utilized for gaskets they are apt to stick to the metal and upon overhauling must be scraped off. This means making new members and a loss of time and a source of expense to the owner. A tight fit may be made by rubbing the packing and metal parts with dry graphite. This is not affected by heat and will allow the gaskets to be removed as a whole.



GASOLENE AND OIL SCHEDULE

MONTH OF

Date	Gas. Gals.	Oil		
		Cyl. Qts.	H. Speed Qts.	Gear. Qts.

5	20	10	2	0

Form 7, Gasoline and Oil Record, Boarders' Cars.

When asbestos is leaded it should be laid flat upon a smooth surface and handled carefully as it tears easily.

MECHANICAL POINTERS for GARAGEMEN AND OWNERS

REMOVING FROZEN TIRES.

Few automobilists remove the tires from the wheels unless obliged to through a puncture or a blow-out. Where the members have been on the machine for several thousand miles and the car operated over wet and muddy roads without the casing being taken off, the task is frequently difficult.

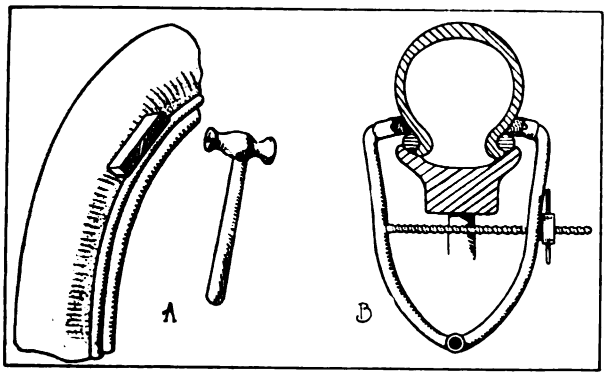

Fig. 1—Some Tire Removing Hints: A, Using Block and Hammer; B, Clamp for Starting Shoe Frozen to Rim.

The writer noted an instance of this kind recently. The car was one of the popular type, fitted with large shoes, and its owner had driven the machine something like 4000 miles since its purchase without touching the front tires. One of these picked up a small nail the point of which gradually worked through to the inner tube puncturing the latter.

Upon attempting to remove the envelope it was found to be frozen to the rim and although different forms of tire tools were tried none started the shoe. Another motorist whose automobile was equipped with the Fisk bolted-on type, solved the problem with the tool used in connection with this make and illustrated at Fig. 1 B. The device consists of two hinged jaws operated by a threaded bolt and a turnbuckle.

Two smooth blocks of hard wood about three inches in length, were placed, one on either side of the tire and in proximity to the rim, as shown in the sketch. The jaws of the tool were compressed slowly which forced the bead of the shoe away from the metal. The instrument was reversed and the other side of the casing separated from the rim.

Having started the casing, one of the blocks was placed against that part of the tire which was still frozen and several sharp blows struck with a hammer as depicted at A. Care should be taken to remove all sharp corners from the wooden members.

Upon attempting to remove the inner tube from the shoe it also was found to be frozen and the operator in trying to force the members apart tore the tube badly. The tube evidently had been placed in the casing without the latter being treated with talcum powder. By a liberal application of gasoline and careful handling the tube was separated from the shoe. The same conditions existed with the other front member and the process of removal would have been difficult on the road, especially at night. Before replacing, the rims were cleaned thoroughly and smeared with graphite. Although tire makers advise removing the shoes and cleaning the rims at stated intervals, this work often is neglected.

DOUBLE ACTING GASOLINE MOTOR.

A hydrocarbon motor, the power of which is varied by the amount of mixture admitted at constant pressure, and the mechanism of which gives two explosions every revolution with only a single working cylinder, has been brought out by the Holmes Engine Company, London, England. The inventor claims that he can make it weigh as little as one pound a brake horsepower, also obtain economy of fuel owing to the gas always being burned at the most efficient degree of compression.

At Fig. 2 is presented a sketch of the device and it will be noted that the main or working cylinder is equipped with a piston which is of the steam engine type and has two ports. The piston rod passes through a special form of gland, which is not indicated in the drawing, and below is attached to another piston of similar size operating in a separate tandem cylinder. Leading from the lower piston is a connecting rod attached to an ordinary single throw crankshaft. The office of the lower piston is that of a pump, compressing as it does, mixture into a separate chamber where it is stored at a considerable pressure.

At the side of the main cylinder there is a hollow piston valve and it may be explained that the burnt gases from the explosion chamber pass through the ports and over the ends of the valve and move out at the two exhaust ports. Inside the piston valve, however, there is another piston, which also moves, uncovering the inlet port and allowing the mixture stored in the reservoir to pass into the top and bottom ends of the hollow valve, respectively.

These charges are trapped for a brief period, and by the movement of the outer valve the transfer port registers with either of the ports of the main cylinder, and the piston inside the valve rises as the working piston descends, thus transferring the charge to the combustion chamber.

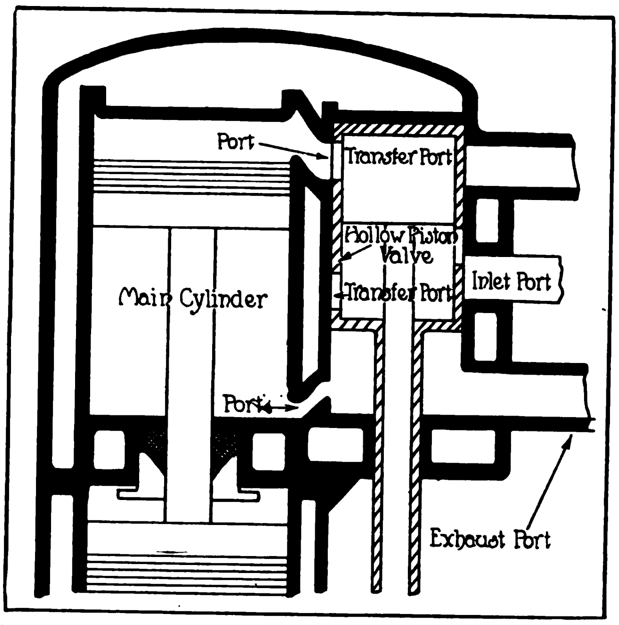

Fig. 2—Double Acting Gasoline Motor Which Gives Two Explosions Every Revolution.

Both the outer valve and inner piston are operated from eccentrics, and are given variable speed by means of combination of a Stephenson link motion with a cam gear. Its operation transmits the desired motions to the valves, with the additional advantage that the travel can be controlled, thus varying the cut-off of the intake. The result is to allow either large or small charges to be passed into the main cylinder. When these are large the working piston is some way down on its stroke before ignition takes place, while with a small amount it may be near the top, owing to the fact that the piston in the valve only transfers the charge to the main cylinder, and that firing takes place always just as soon as this movement is complete, the compression at the instant of explosion being constant at all times. Some details are not exactly clear, owing to the fact that the inventor is withholding full description until patents have been secured.

DRILL AND REAMER HOLDER.

A useful and easily made drill socket designed for holding straight shank and broken drills, reamers and similar tools, is shown at Fig. 3. It is so designed and constructed as to take adapters, permitting of the use of drills of various sizes. The former are turned from a piece of cast steel and may be made with a tapered shank on a square section member, the latter being suitable for use with a ratchet brace.

A recess is bored in the holder, as indicated by the dotted lines, either for the fitting of the shank of a drill or to take the various split adapters. The loose collar which fits the outside of the holder is drilled, countersunk and tapped for a square headed set screw. This is slipped over the end of the holder, and the screw tightened, which operation presses the latter against the recess of the former and causes it to grip either the drill or one of the adapters.

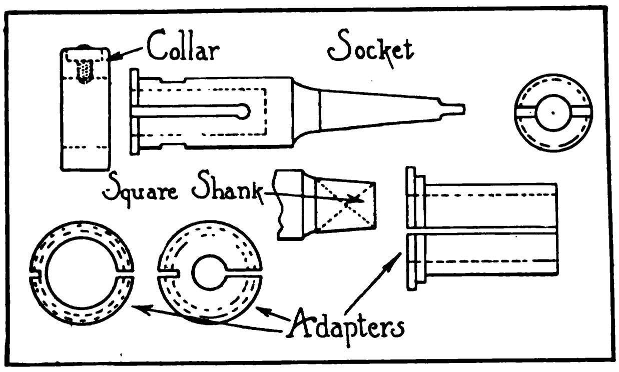

Fig. 3—Socket for Holding Broken Drills and Reamers.

The latter should be constructed of mild steel and as many can be made as required. They are completely divided at one side, and partly slotted at the other, this being done for the purpose of allowing them to be closed easily when pressure is applied on the outside holder. The slots of the former should always coincide with the latter.

COMBINATION VALVE GRINDER.

In grinding valves it is essential that the tool utilized should be given an oscillating motion to obtain the best results. Some repairmen use an ordinary carpenter's bit stock, and when this is equipped with a ratchet, it is necessary to shift the device to obtain a reverse movement. Even with the average breast drill it is not possible to oscillate the valve, but a continuous turning movement must be given, and this is not only bad for the valve seat, but pushes the grinding medium to one side, so that it must be renewed frequently during the operation.

At Fig. 4 is depicted the Ashcroft combination valve grinder brought out by Brown Bros., Ltd., London, England. By means of an ingenious automatic clutch action the flat nosed tool, similar to a screwdriver blade, within the chuck can be made to oscillate within an arc gradually advancing to the right, even though the handle operating the tool be turned continuously in one direction. This advancing of the arc oscillation prevents, it is claimed, the formation of grooves in the valve or seat.

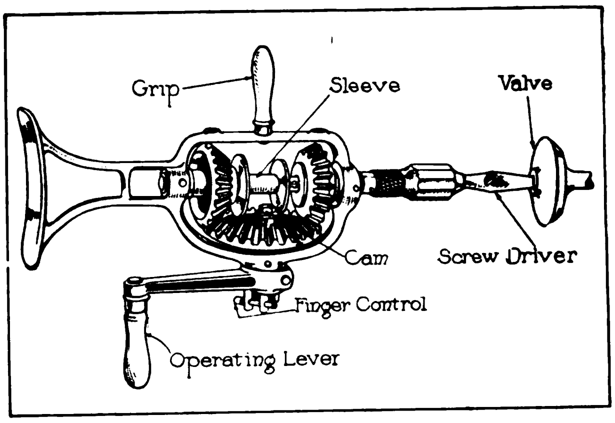

Fig. 4—New Form of Valve Grinding Tool.

If required, the tool can be used as a breast drill by adjusting the finger control at the end of the handle shaft and placing the cross pin in one of the slots provided. By securing the former in another alternative position the device can be used as a ratchet, with either right or left hand movement, and in such form is useful for removing or inserting screws in awkward positions, and for drilling and tapping places where a full swing of the operating crank cannot be obtained.

The oscillating movement is obtained by the centre sleeve being thrown from one end of its shaft to the other and into engagement with ratchet keys at either end. This movement of the sleeve is caused by the plate cam which is fixed to the handle shaft, and at certain points in each revolution moves the sleeve to one end or the other, thus causing the drive to take place through two small bevel pinions alternately.

EMERGENCY WHEEL PULLER.

It rarely happens that a rear wheel must be removed while on the road, but when such is the case, and where it cannot be taken off easily, a wheel puller not being available, it is possible to utilize the hub cap as shown at Fig. 5. A small block of wood is inserted in the cap which is partially screwed up on the hub and a further movement will start the wheel.

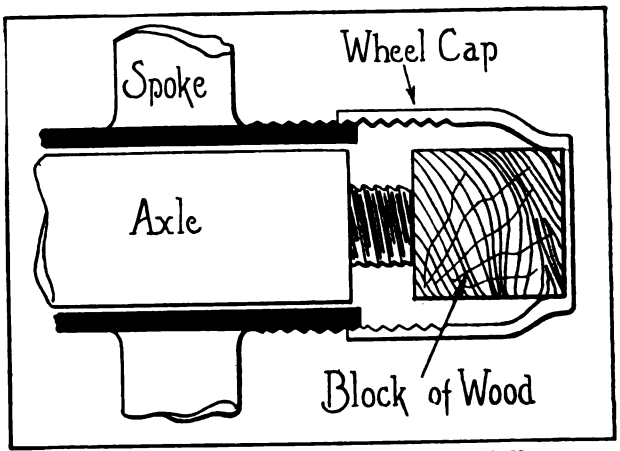

Fig. 5—Utilising Hub Cap as a Wheel Puller.

This method is not to be recommended where the metal is light, nor should undue strain be brought to bear. When the wheel is stubborn it can be started by a few smart blows with a hammer on the cap.

UNIVERSITY OF CALIFORNIA

TIRE INFLATING DEVICE.

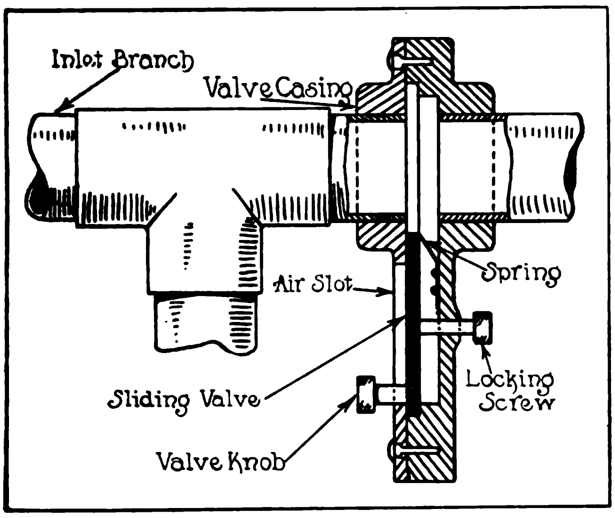

Fig. 6—Tire Inflating Device Incorporated in the Intake Pipe and Operated by the Motor.

Various methods are utilized to relieve the motorist of the arduous work of pumping up pneumatic tires, a disagreeable task at the best even in cold weather. There are many devices upon the market, the majority of which store compressed air, while others employ the energy of the motor to drive some form of pump.

In the sketch presented at Fig. 6 is an appliance invented by an English motorist which is said to be entirely successful and a feature claimed for it is that after installation there is no expense attached in its operation. The principle of the tire inflator is that of the pump, the piston of one cylinder of the motor compressing air and forcing it through a check valve and tube to the tire.

To prevent mixture being drawn from the carburetor a sliding valve is incorporated in the intake pipe leading to the cylinder employed. This valve moves freely in a slot and is fitted with a spring as depicted. When the mixture is to be cut off from the vaporizer the valve is moved upward and locked by a screw which operation closes the intake member. This movement opens an air slot which communicates to that portion of the intake pipe leading to the combustion chamber of the cylinder.

The other fitting is a non-return or check valve which is fitted to the exhaust valve cap of the same cylinder. This may be equipped with a shut-off cock similar to a compression member, for the purpose of closing the part completely. A copper tube is attached and carried to some convenient part of the chassis. A rubber tube is fitted and provided with the usual device for screwing to the threaded member of the tire valve. A wire gauze filter is incorporated either in the check valve or piping to prevent any particles of carbon or foreign elements being carried into the inner tube.

The action is as follows: When a tire is to be inflated the tube is fitted to the member and the motor started. The sliding valve is then raised by means of the knob and locked. Air is drawn in through the opening described and passes into the cylinder. On the compression stroke this is forced through the check valve and piping to inner tube. The device is applicable to multi-cylinder motors.

MONKEY WRENCH PIPE CUTTER.

Sometimes in the repair of old cars it is necessary to fit new piping. The usual method of cutting is with a hacksaw which involves considerable labor. A simple tube cutter and one that is inexpensive and made easily is shown at Fig. 7 A. It consists of an ordinary monkey wrench to which cutters are fitted. These steel discs can be obtained at any hardware store for a few cents. A small hole is bored through each jaw of the wrench and a stove bolt passed through the disc and tightened. A little space should be allowed for the latter to turn. To cut different sizes of pipe, it is necessary simply to adjust the jaws.

FILE PIPE WRENCH.

Utilizing a Stillson on brass or copper piping is bad practise as it will mark or cut the metal. A handy pipe wrench can be made from an old file and it has an advantage over the former tool as it will not injure the tubing. An old 12-inch half round file should be chosen and ground fairly smooth on the flat side; just enough to remove the points of the teeth for a short distance. Next, the end should be annealed and bent into the shape shown at Fig. 7 C. The size of the curve will depend upon that of the tubing. A file bent around an inch pipe will take three-quarters. A hole is next drilled and tapped to take a long set screw. This device will hold brass or copper tubing securely in a very effective manner.

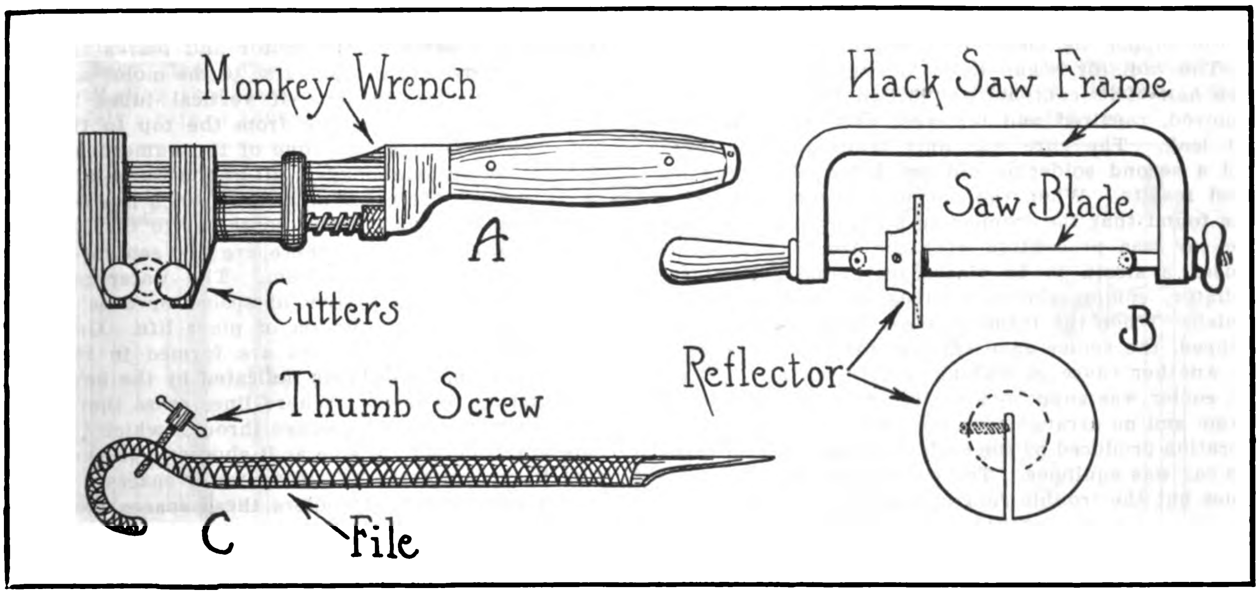

Fig. 7—Some Repair Shop Hints: A, Pipe Cutting Attachment for Monkey Wrench; B, Reflector for Hacksaw Blade; C, Pipe Wrench for Brass or Copper Tubing.

HACKSAW REFLECTOR.

Occasionally the repairman is called upon to use the hacksaw where the light is not good and when such is the case it is difficult to cut to the line scribed. At Fig. 7 B is presented a device that is made easily and will facilitate the work. It consists of a round disc of sheet brass or light metal, which is turned so as to have a collar at the back. A slot is cut through the centre allowing it to slip over the blade of the saw. The reflector is held by a .1875-inch set screw and enamelled white.

WHY SOME RADIATORS LEAK.

It is not an uncommon occurrence for some radiators which have been in service but a few months to begin leaking. Sometimes this begins before the installation of an anti-freezing mixture, and even after the cooler is repaired fluid finds its way through some opening. Usually the operator condemns the work of the repairman, thinking that the latter was at fault.

This may not be the case as other conditions may have been responsible for the loss of fluid. The trouble may be due to a bent or broken frame which brought about conditions similar to those depicted at Fig. 8 A. This radiator was supported by a metal band fastened to the frame by bolts. The cooler was held by studs integral with the former and secured to the supporting member by nuts.

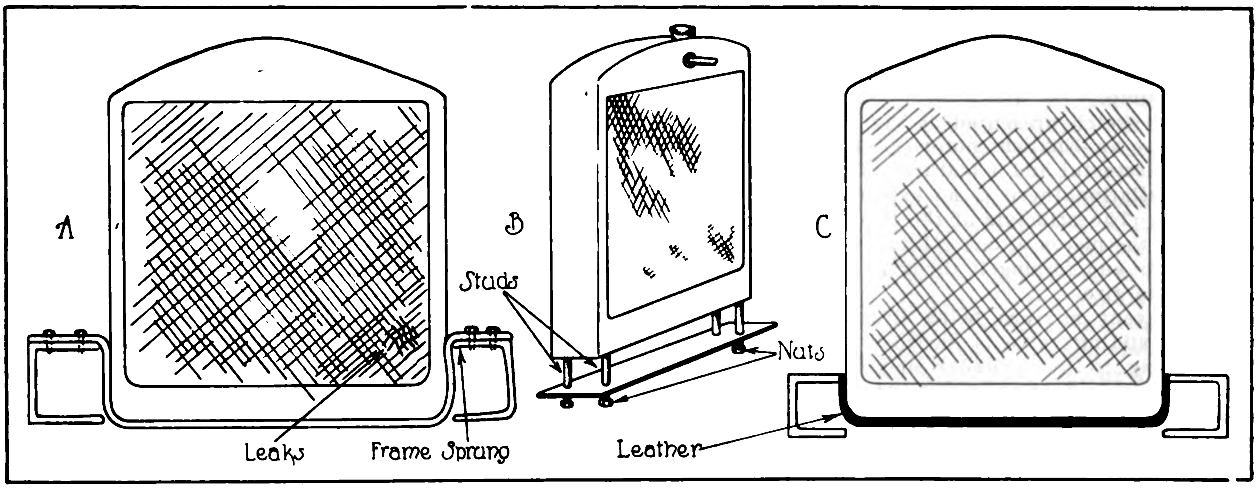

Fig. 8—Causes of Leaks in Radiators: A, Depicting How a Broken Frame Sprung the Tubes; B, Screwing Up Nuts Too Tightly Should Be Avoided; C, Excessive Vibration, Which Started Cooler, Reduced by a Leather Seat.

The radiator began to leak, slightly at first, but soon half of its contents was lost in 24 hours. It was removed, repaired and replaced, and for a time did not leak. The cure was only temporary, however, and a second soldering did not bring about the desired results. When the machine was overhauled it was found that the frame was broken and that when the car was proceeding over the road, the stresses caused a strain to be placed upon one side of the radiator, compressing the tubes as depicted in the sketch. When the frame was repaired, and the leaks stopped, the cooler gave efficient service.

Another cause of leaking is depicted at C. Here the cooler was supported by the cross member of the frame and no arrangement provided for absorbing the vibration produced by the high speed motor with which the car was equipped. The cooler was soldered many times but the trouble returned after a certain period. Finally a cure was effected by placing a strip of leather between the supporting member and the cooler. The writer knows of several cases of leaky radiators which were treated successfully by this simple method.

A good radiator may be spoiled in the overhauling of the machine by screwing up the nuts too tightly when replacing the device on its support. At B is shown an excellent method of securing this member. Bottom stud plates support the member and a single rod to dash or motor holds it rigidly. When the locking members are set up too snugly the studs are likely to be started, thus causing a leak.

When a cooler continues to leak after repeated soldering it is well to examine the frame and supports as well as the locking devices to note whether or not some of these are exerting an undue pressure upon the member. Where radiators are constructed and attached properly, they should give efficient service.

In the event the member becomes damaged and the operator attempts a repair, it is well to have a knowledge of the construction of the device as its efficiency may be reduced through too liberal application of solder, thereby shutting off several tubes. Then again, one or more of the tubes may be completely closed in the centre of the container, and when these are filled with water, the fluid may freeze and burst the tubes because it will be impossible to drain the water from the upper part of the members.

In practise it is customary to use the words "honeycomb" and "cellular" to designate the same type of radiator, both being in contrast to the tubular type. In order to realize the difference between a cellular and tubular construction, it should be borne in mind that the water in a radiator must go from the top to the bottom. It enters the top hot from the water jackets of the motor and leaves the bottom relatively cool in its course to the motor again.

In a tubular member, if vertical tubes be employed, the fluid, in going from the top to the bottom, can go through any one of the numerous tubes. Should one become clogged, all of the water will have to go through the other members. Each is a separate path from the upper water container to the lower.

In the cellular type there are not separate paths from the top to the bottom. The water passages rather constitute a system of spaces or cells similar to the cellular construction of plant life. Generally speaking, cellular radiators are formed in three or four divisions, these being indicated by the horizontal lines across its front. Where lines cross there is an open horizontal water passage through which the fluid can flow from side to side as it chooses. In each division there is a series of zigzag water spaces.

In some types of coolers these spaces really are zigzag tubes, but in others they not only provide an up-and-down direction of flow, but also interconnect to give a horizontal flow as well. There is no clearly defined passage, though the water must flow in a certain direction, as is the case with tubular members.

MOTOR REVOLUTION CHART.

Motorists mechanically inclined who desire to ascertain the number of motor revolutions a minute at different speeds will be aided by the chart presented at Fig. 9. The usual method involves considerable calculation or the use of the slide rule. By following the instructions given herewith, the most unskilled in mathematics may note the speed of the motor when the vehicle is travelling at a rate varying from one mile to 100 an hour.

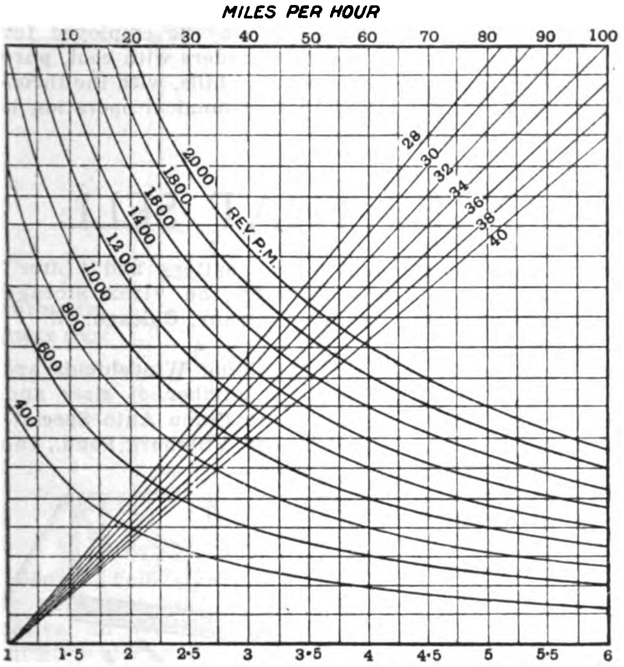

Fig. 9—Chart for Ascertaining Number of Motor Revolutions at Different Road Speeds.

To use: Find the miles an hour on the top line and follow the vertical line down until it cuts that of the wheel diameter. Then move along a horizontal line until a point vertically above the gear ratio on the bottom line is reached. The engine curve which passes through this point, or would pass through it if drawn up, gives the required motor speed.

For example: A car is proceeding at a rate of 30 miles an hour, has 32-inch wheels, and is geared three to one. Proceed along the top line until the figure 30 is reached; drop vertically until the 32-inch wheel line is encountered; then, work horizontally till the vertical line is met from the gear ratio three on the base line. The nearest engine revolution curve will show that the motor speed has reached approximately a rate of 1000 turns a minute.

If any three of the four quantities, gear ratio, speed of car, wheel diameter, and engine speed are known, the fourth can be found by inspection. Engine speed in revolutions a minute is, however, the factor usually required.

GAS COMPRESSOR FOR CLEANING.

Some shops utilize a brush and can of gasoline to clean the dirt from the chassis, but this practise has its disadvantages when certain parts of the mechanism are treated because of their inaccessibility. Many large garages employ an apparatus which uses gasoline and compressed air. These devices may be made by any repairman and are not very expensive.

At Fig. 10 A is depicted a home made compressor which consists of a galvanized tank with a tube soldered into it at the top and another at the lower end. These members are fitted with valves as shown and joined. The hose may be of any suitable length and of the size known as .375 inch, and attached to the latter is a nozzle with a .25-inch flared outlet. A bicycle pump is connected with the tank at one side and a pressure gauge installed at the top of the former.

In service, a gallon of gasoline is poured into the tank and the pump operated to obtain a pressure of several pounds. The valves are then opened to such an extent as to permit a small quantity of the fluid and air to flow, producing a spray or vapor. While the device is not as efficient as those marketed, it is practical and adaptable to a small shop.

CONE CENTRE DIVIDERS.

A handy dividing tool for scribing accurate lines around existing holes or centres is outlined at Fig. 10 C and consists of the clamping sleeve and needle of a regular surface gauge, and a hardened centre box having a 60-degree cone at the lower end. The centre bar may be made of drill rod and of the size of the surface member, so that the sleeve will fit. When the holes to be used as centres are larger, a .3125-inch ball is employed. This has a 60-degree centre made in one side as depicted. The sphere is magnetized, so that it will not fall off when being placed in position. This device will prove useful for all around work.

NEW TYPE OF CARBURETOR VALVE.

A new type of extra air inlet valve which is operated by hand, and designed to fit White & Poppe (British) carburetors, has been brought out by an English concern, and is illustrated at Fig. 10 B. The device is fitted into the elbow of the intake pipe, and although a special form is required, no other alterations are necessary in installing it for use.

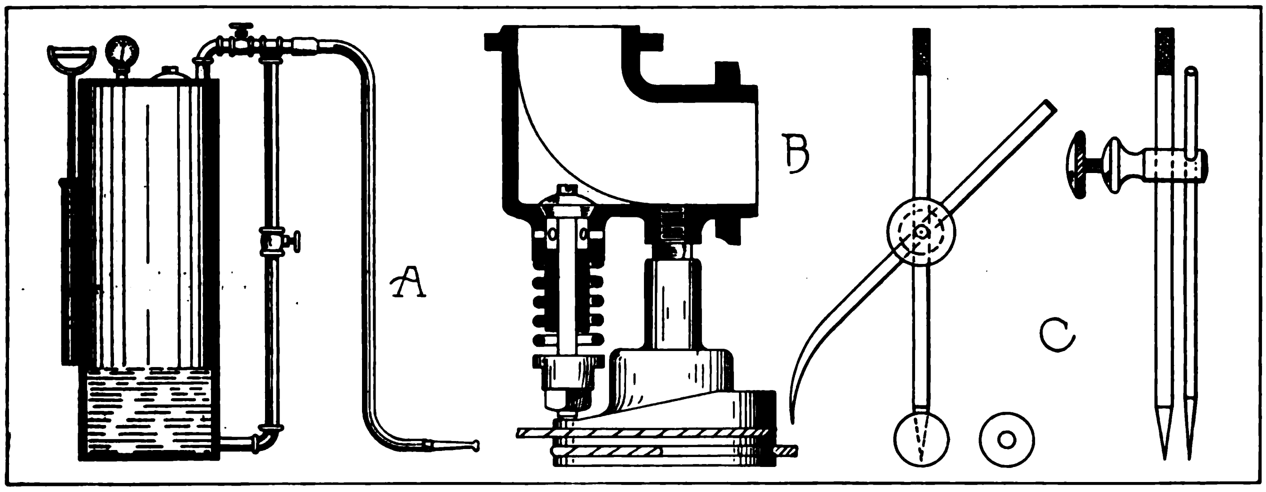

Fig. 10—Appliances Applicable in Motor Car Repairing: A, Inexpensive and Easily Constructed Gasoline Compressor; B, Hand Controlled Extra Air Inlet Carburetor; C, Cone Centre Dividers.

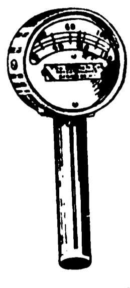
The valve is provided with a stiff spring which retains it on its seat, and is raised by the action of a cam, upon which the bottom of the member rests. This cam is rotated by hand through Bowden wire fitted and wound in the grooves as shown. The construction of the operating mechanism is such that an extremely fine adjustment is possible as nearly an entire revolution of the cam is required to give the valve its utmost lift.

At its highest point the cam continues for a short distance at right angles with the stem of the valve, so that no effort is required to hold the latter open to its limit. The attaching of the device does not necessitate any alteration in the adjustment of the carburetor as the appliance is entirely supplementary and intended principally for service when the motor is warm or operating at high speeds.

Another feature is that it may be employed for scavenging, by providing the cylinders with cool, pure air when the vehicle is descending hills, with the throttle closed. It is claimed that economical operation is possible through its use.

ACCESSORIES AND APPLIANCES THAT SELL.

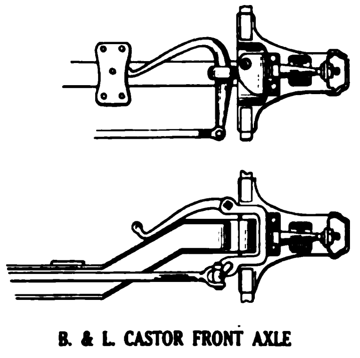
The Tire Pressure Tester, as shown herewith, and made by the Brown Company, Syracuse, N. Y., is a device for proving tire inflation pressures. It has a circular form about the size of a silver dollar mounted on the upper end of a short stem. When it is desired to prove the tension of air in any tire, the lower end is slipped onto the tire valve stem, and then removed. The maximum will be shown by a red hand which will stay in that position until turned back by hand. This makes it possible to take the pressure, and read it when convenient, instead of bending over in the dust of the road to note it in place. This is small enough in size to be carried in the pocket, and is guaranteed within two per cent. by the maker. The exterior is of brass, highly polished to present a neat appearance.



BROWN TIRE PRESSURE GAUGE

★

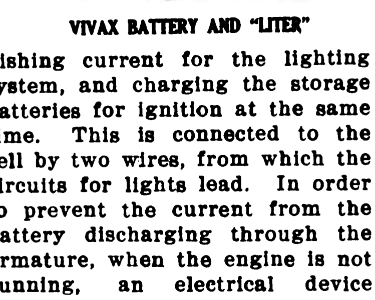
The B. & L. Castor Front Axle is a safety device, primarily, although as an axle, it is as efficient as other designs. The difference lies in moving the pivot pin centre upon which the steering knuckle turns forward of the stub axle centre line, so that the wheel as a whole actually trails back of its pivot point. This, the maker claims, will cause the wheels to run straight ahead whether the steering connections are made or not. This feature should make this work less fatiguing, for the car practically steers itself. Among the many advantages claimed are: Steering, 85 per cent. easier, driver has much better control of the vehicle, impossible to break knuckle or pivot pin, impossibility of breaking a spindle, car can be turned in less space, and many others. The patents are held by the Queen Manufacturing Company, Charles City, Ia., and Chicago, Ill., for whom the Weston-Mott Company, Flint, Mich., is producing the device in quantities.



B. & L. CASTOR FRONT AXLE

★

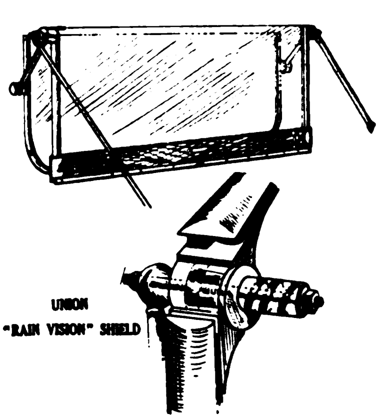
Vivax Storage Batteries are used as an auxiliary to the Vivax "Liter" presented herewith, this being a current generator designed for electric lighting of automobiles. The latter may be driven by belt, gear or chain, furnishing current for the lighting system, and charging the storage batteries for ignition at the same time. This is connected to the cell by two wires, from which the circuits for lights lead. In order to prevent the current from the battery discharging through the armature, when the engine is not running, an electrical device breaks the circuit between that and the battery. When the motor speed reaches a certain figure, this automatically closes, throwing the generator into play as a charging unit. Another automatic device takes care of variable speeds and prevents battery injury. Both battery and "Liter" are made by the Vivax Storage Battery Company, Chicago, Ill.



VIVAX BATTERY AND "LITER"

★

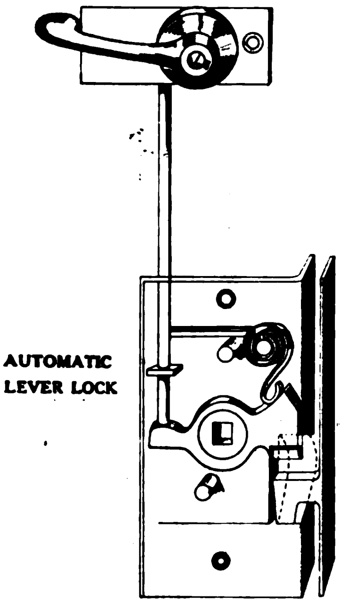
Union Folding Windshields are made in a number of sizes and styles by the Union Auto Specialties Company, Pittsburg, Penn., the so-called rain vision being shown herewith. Three positions are possible; with the upper half of the glass inclined slightly forward, with the same part in front of and parallel to the bottom, in which its lower edge laps over the top edge of the latter slightly, and folded as drawn. The first is an ideal wet weather form in that the inclination of the glass prevents the ingress of rain, snow or much wind, while at the same time, leaves ample space through which to view the road. The second placing of the upper half is excellent for summer touring, in that the air can circulate freely through the shield, while wind, dust, insects or anything liable to bother driver or passengers are barred effectually by the overlap mentioned. Below is shown the automatic lock with which all of these products are equipped, this being a phantom view, in which the internal balls, which do the locking, may be seen.



UNION "RAIN VISION" SHIELD

★

Automatic Security-Latch Lever Locks are for use on car doors, the rapidly increasing number in service necessitating something of this sort. It is not a lock in the same sense as the device which is not opened without a key, for with this latest production of Joseph N. Smith & Co., Detroit, Mich., no key is needed, although

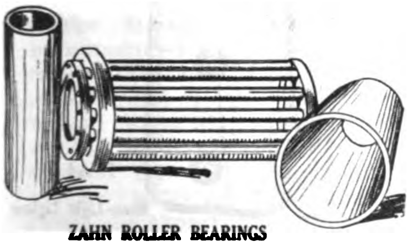


AUTOMATIC LEVER LOCK

the door is held closed until the lever on top is used. As an alternative, an outside handle may be fitted which will also release the catch, but as the maker says, it is eminently fitted to use without this attachment, which detracts from the appearance of a four-door body of clean lines. In construction it is very simple, as the drawing on this page indicates, consisting of a small number of parts, all of cold rolled steel or drop forgings.

*

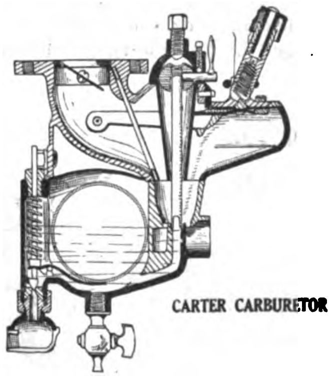
Zahn Roller Bearings have an interchangeable feature which renders them quite different. These are made by the Detroit Roller Bearing Company, Detroit, Mich., while the Bower Roller Bearing Company of the same city has recently taken out a license from the inventor to construct a slight modification of the design. The form shown on this page is that brought out originally by Oswald F. Zahn. This has two sleeves and one set of self-contained rollers, the latter including the thrust rings. The former are placed in the wheel and on the axle turning within it. The bearings each have a small inner ring and a large outer one which enter grooves in the rollers, these being located at the single end of the former. It has been found that these two, acting as guides without further friction or strain, keep the rollers in alignment at all times, so that they always run exactly true. The collar turned into each one of the rollers, into which the larger ring fits, makes this bearing able to take up all end thrust. The assemblage of rollers and cage is such that one end of the internal part may be twisted through almost half a circle, and when freed will right itself, regardless of the amount and character of end thrust upon it.



ZAHN ROLLER BEARINGS

*

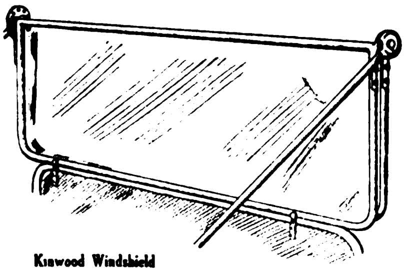
The Carter Carburetor is a recent vaporizing device which has been placed on the market by the Carter Carburetor Company, St. Louis, Mo., a firm having no connection with the maker of the automobile by the same name. It is said the device is the result of 11 years' study and experimentation by William C. Carter, the concern's superintendent. It is a vertical multiple-jet form with float control of the fuel entrance, the latter consisting of a seamless copper ball, a perfect sphere which rests upon the inner end of a needle operating lever. When the ball rises through the increased height of liquid, a spring is allowed to push the controlling needle down and cut off the supply. As the sketch herewith brings out, flow from the float chamber of the vaporizing compartment is through a curved passage, thence up through the interior of the hollow pipe. The latter has a series of small holes drilled in it so as to form a continuously ascending spiral. According to the engine demands, the fuel will climb inside of this, so that the stronger the suction, the greater number of openings which will be spraying. The air inlet is near the base, where it surrounds the gasoline standpipe, rising with it, until the vaporization chamber is reached, where it branches out being augmented by the auxiliary air passage. The latter curves downward from the valve at the top and after passing the fuel pipe, upward to the engine connection at the left. When the motor is slowed down, on the other hand, a nearly pure mixture passes directly through an inclined tube leading from the lower part to the upper side of the throttle. In this way, even with the latter shut off for very slow speeds, the anti-strangling tube, as it is called by the maker, furnishes sufficient fuel to enable the engine barely to just turn over. Model B is made in five sizes, and Model A, which is water jacketed, in four.



CARTER CARBURETOR

*

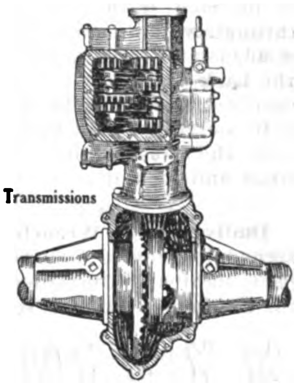
Kinwood Windshields being marketed by the Kinsey Manufacturing Company, Toledo, O., maker of radiators, oilers and motor car appliances, are adaptable to any type of car and in the accompanying illustration is shown the device folded. Its construction is such that it can be placed at any angle and this applies to the lower as well as the upper section. The locking members are automatic in their action and are said to be so arranged that they will not jar loose and at the same time will permit of changing the angle by the operator without leaving the seat.



Kinwood Windshield

*

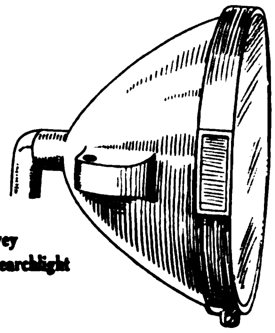
Covert Unit Transmissions, the product of the Covert Motor Vehicle Company, Lockport, N. Y., are designed for hard service and these are made for vehicles ranging from 1000 pounds to three tons capacity. The gearbox is attached to the differential housing as a unit as shown in the accompanying illustration. This design is utilized in pleasure as well as commercial vehicles and has been adopted by several of the leading manufacturers.



Covert Unit Transmissions

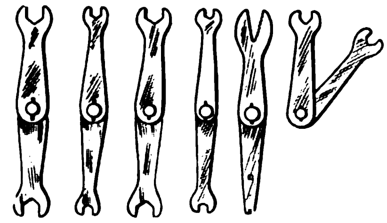
*

The Silvey Electric Searchlight is of the torpedo type, and its carrying ears are cast integral with the body, so located as to produce equal balance and rigidity. It is parabolic in shape inside and conical outside, is free from beads and other obstructions and therefore is cleaned easily. The materials employed are silver, aluminum and another light metal which is held to possess great strength, and the complete lamp is said to be unusually light. The casting from which it is made is turned in a machine to a perfect parabola, ground and polished until it has the brilliancy of a mirror. It is claimed that it will not tarnish. The door is so constructed that the lamp is practically air tight, eliminating dust and moisture. The lamp holder is adjustable by means of a set screw. In addition to this light the Silvey Electric Company of Dayton, O., manufactures another which may be inserted in the regular gas lamp. This member comes complete having an adjustable socket and flexible cord for connecting to the source of electricity. The device which is fitted to the regular gas lamp is a silver spun reflector, highly polished and is furnished in sizes from five to 11 inches, inclusive. It is attached readily in a few minutes and may be removed easily in the event the use of the acetylene burner is desired. The incandescent lamp is mounted in a marine type socket, being securely locked in place. The latter is inserted in a tube or tunnel through which the wires enter and is adjustable in a curved stem in the back of the lamp. All that is required to set the light for focus is to loosen the locking screw, and slide the tube to the position desired and lock it into place.



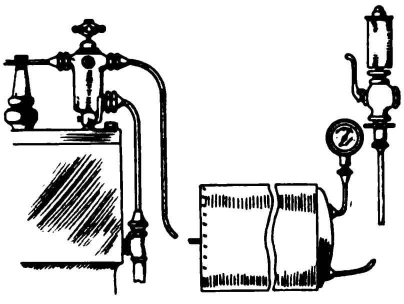
Silvey
Electric Searchlight

Dudly Folding Wrenches are designed to provide a durable, compact, light and convenient wrench for automobile, motorcycle or motor boat work. The maker is the Dudly Tool Company, Menominee, Mich., which has had long experience in the production of tools of all sorts. It will be noted by examination of the accompanying sketch that the device comes in sets, comprising openings for all classes of work. The entire set of six folds up and fits into a case about seven inches long by four high, making a decidedly convenient method of carrying them about.



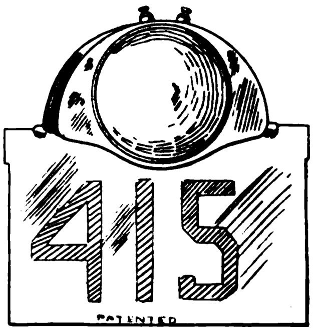
Dudley Folding Wrenches

Lunkenheimer Whistles are being utilized largely on motor boats as the Federal laws require a device of this kind. They also are applicable to an automobile and provide a convenient and positive means of signalling. That depicted in the drawing, however, is the type employed on power boats. Energy is taken from the cylinder and the exhaust and led through piping to a check valve to a tank and stored. The latter is fitted with a gauge which indicates the pressure in the container and when a sufficient amount is secured further supply may be cut off by a valve. A whistle is attached to a tube leading from the tank and is operated by the energy of the gas. The equipment is installed easily and occupies little space. It is the product of the Lunkenheimer Company of Cincinnati, O., maker of specialties adapted to motor cars and marine engines.



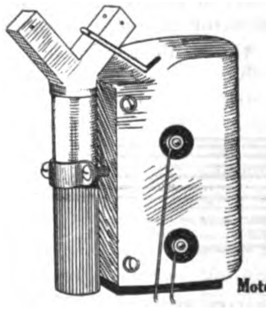
Lunkenheimer Marine Whistle

The Holt & Beebe Electric Tail Light is designed to replace the member utilizing oil, and its construction is such that it meets with all requirements of the authorities, providing as it does a brilliant red light as well as white. It is neat and compact, may be attached easily to the number plate or body of the car, and is operated by electricity, the usual equipment being a six-volt lamp, unless otherwise ordered. It is made of brass, or black or white nickel, and equipped with two screw terminals for attaching the wires from the source of electricity. The arrangement of the device is such that a brilliant white light is shed upon the number plate and the red semaphore to the rear also is illuminated, this glass being of ample dimensions. A switch is placed convenient to the operator and the light may be turned on or off at will without the driver leaving his seat. This arrangement will appeal to motorists who dislike using matches around the car and bothering with kerosene. In addition, it is said no cleaning or attention is required. It is marketed by Holt & Beebe, Boston.



Holt-Beebe Rear Light

The P. & B. Motor-Light Lighter is marketed by the P. & B. Manufacturing Company, Springfield, Mass., and is installed in connection with a gas tank. With it the acetylene lamps may be lighted from the seat of the automobile. It consists of a pressure regulator, flame igniter and controller, spark coil, metal tubing and wire. In the illustration is shown the appliance attached to the burner and it will be noted that two metal points project over the tips of the former. Between these and in proximity to the jets a spark is produced by a low-tension current which ignites the gas. The latter is so controlled that the flame is maintained steadily and at the proper height. The pressure regulator attachment is not shown, but this is fitted easily in line with the usual piping. It is a small device fitted with a union and replaces the regular connection used on the gas tank, the valve of which is opened, thus assuring a supply of acetylene ready for instant use. The device operating the mechanism is placed upon the dash or in a position convenient to the driver and by turning a handle acetylene is conveyed to the burners and lighted. It is claimed that the apparatus may be operated at two ounces uniform gas pressure. It has obvious advantages over the

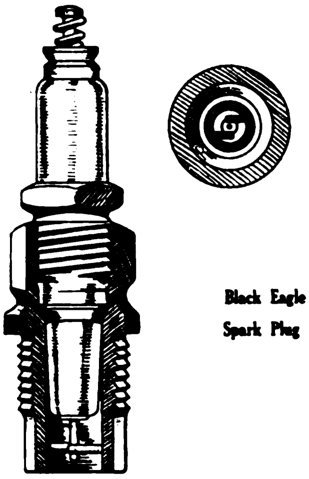


P. and B.
Motor-Light Lighter

ordinary forms which require the operator to stop the machine, turn on the gas, open the lamp doors, ignite the acetylene and relock the lamps. Frequently the pressure is too great and sometimes the mirrors are ruined by the excessive heat generated before flame can be reduced to proper size. The discomforts of alighting when bundled up in heavy clothing and wrapped with robes, as well as in rainy weather, can be avoided. Economy is effected as many times the lamps are left burning because of the labor involved in lighting. With the Motor-Light the lamps may be extinguished at will, and relighted without trouble.

★

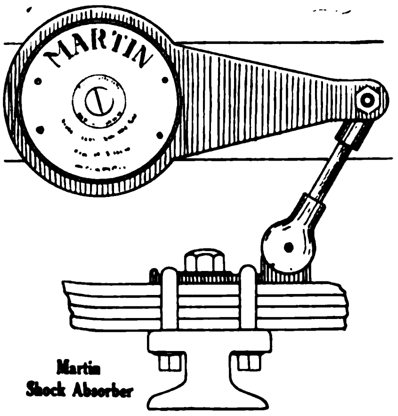
Black Eagle Spark Plugs produced by the Progressive Manufacturing Company, Torrington, Conn., present constructional features of merit, one of which is simplicity and ease of disassembling for cleaning or replacement of parts that might be broken through accident. The metal body is recessed and a gasket inserted to prevent the escape of gas past the porcelain. The locking member is of the usual form, being threaded into the body. The electrode is pin shaped and is located between two similar members providing a double sparking gap, as shown in the accompanying sketch. The high-tension wire is held by a spring terminal which permits of easy engagement or release. A cup shaped member is fitted at the lower end of the spring which is held securely at the top of the rod on which it moves.



Black Eagle Spark Plug

★

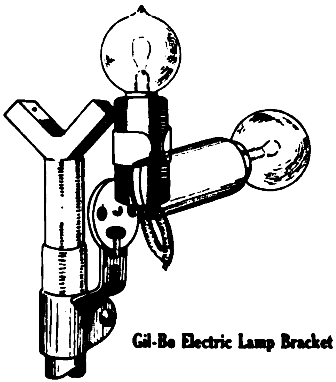
The Martin Shock Absorber, manufactured by the Martin Shock Absorber Company, Los Angeles, Cal., is a device designed to act when the springs recoil. As the latter are compressed the arm of the appliance is forced upward, relieving the friction between the shoes and absorber ring by revolving the T shaped toggle members to the right. The recoil movement draws the arm of the absorber downward, turning the ring to the left. This motion causes the toggle members to straighten until they come in contact with stops provided, thus forcing the brake shoes into frictional engagement with the absorber ring. The necessary degree of friction is obtained by adjusting the hexagon expanding bolt in the centre of the absorber. The coil springs hold the toggles in position ready for instant engagement. The device is packed with hard oil, and it is claimed will not require lubrication but once a year, and is free from rattles or squeaks.



Martin Shock Absorber

★

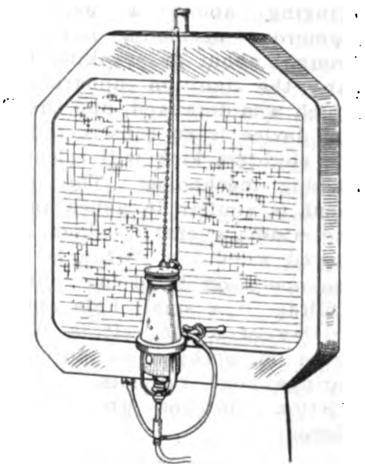
The Gilbo Electric Lamp Bracket is an attachment which permits the use of oil or gas burners without removing either the electric bulb or bracket. This device will appeal to motorists whose automobiles are not equipped with an electric lighting system, which may be desired. The appliance may be fitted easily to the acetylene burner of the headlight, as the operation involves but the locking of a band around the base of the burner. The metal part is hinged, which permits the holder and lamp to be raised or lowered at will, providing a dual lighting system as well as a convenient method of installing an electric lamp. The novelty is made of spring brass, highly polished and nickel plated, and is fitted with notches to hold the bulb either in a vertical or horizontal position. It is inexpensive, equipped with wires for the purpose of attaching the leads from the current container, and is made by the Metal Specialties Manufacturing Company, Chicago.



Gil-Be Electric Lamp Bracket

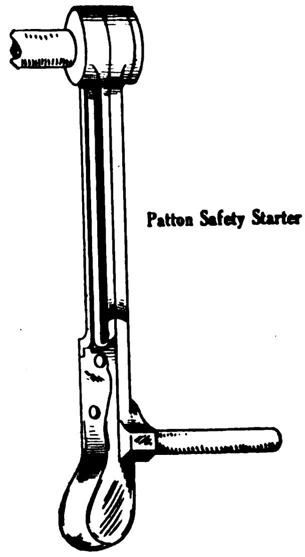
★

The Neverout Radiator Heater is a small, compact device made with the object of keeping the water in the circulation system of an automobile warm when the motor is not in operation and the machine is standing in a cold place. It will appeal to motorists whose garages are not heated and to those who do not favor the use of anti-freezing solutions. The drawing depicts the type intended for garage use, and it will be noted that a tube leading from the appliance, is hooked to the filler hole of the radiator. A bracket is interposed between the cooler and burner to keep the latter from affecting the solder of the former. A pipe leads from the city gas supply to the bottom of the burner and another tube is attached to the petcock under the radiator connecting with the reservoir over the heater. When this is lighted the heated water rises and flows into the cooler. The circulation is on the thermo-syphon principle, the cold liquid falling to the bottom of the radiator, thence to the heater. Another form is permanently attached to the car and acetylene is burned. The generator is a double walled cylinder of about four inches in length with cross staggered tubes connecting the members, around which the gas passes. A burner resembling the Bunsen type is employed and the oxy-acetylene flame is said to have a temperature of about 3000 degrees at the tip of the inner cone. The device utilizes about four times as much air as it does gas and under normal conditions is said to consume about half a cubic foot an hour. The Neverout heater is made by the Rose Manufacturing Company, Philadelphia.



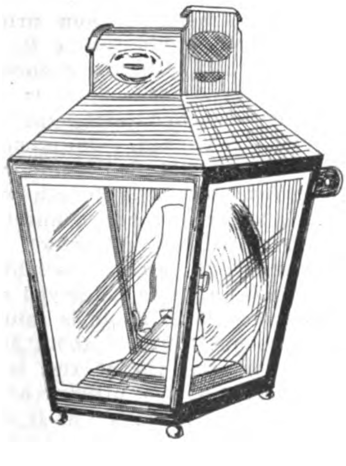
Neverout Radiator Heater

The Patton Safety Starter Crank is being sold by the Patton Crank Company, Chicago, and is designed to eliminate any possible danger in the event of the ignition being advanced and thus bringing about a back fire. Numerous accidents have been brought about by cranking motor cars the ignition apparatus of which was deranged, and the Patton device is so constructed that the slightest kick will release its locking mechanism. The instrument is similar in appearance to the ordinary crank, which is removed when the Patton is fitted, the operation involving but the drilling of a small hole and the driving of a pin. It is claimed there is nothing to adjust, as springs, cogs, ratchets, pawls or friction clutches are not employed.



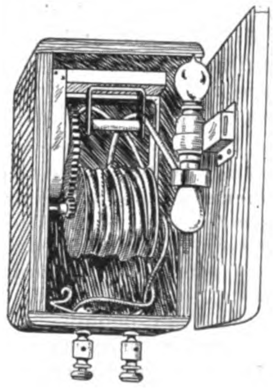
Patton Safety Starter Crank

A New Safety Garage Wall Lamp, which burns kerosene, has been brought out by Benetfink, London, Eng., and it is held the light may be used in a room which is impregnated with gasoline vapor. It is designed for small garages and buildings not equipped with electricity. The appearance and construction are similar to the ordinary wall member, with the exception of the top, which is equipped with a fine wire gauze. The object of this is to prevent the gasoline vapor from reaching the flame, an arrangement resembling a miner's lamp. The lamp is equipped with brackets for attachment to the wall, is about 11 inches square and is said to burn for 15 hours.



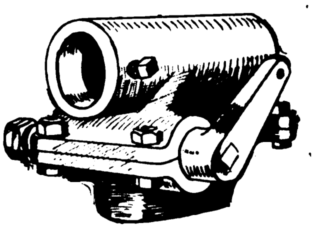
New Safety Garage Wall Lamp

The Christman Dash Lamp is an appliance being manufactured and marketed by the Penn Auto Supply Company, Philadelphia, and the arrangement is unusually neat and compact. It consists of a portable electric light attached to a flexible cord operated by a mechanism which does away with the winding up of the wires after use. The latter pass over a guiding bar and are wound on a drum to which is attached a small gear in mesh with a larger member. This is actuated by a spring that revolves the drum when released, and the cord automatically is rewound. The lamp is fitted to a neat handle and a clip attached to the door of the container keeps the light from rattling or being broken. The mechanism is placed in a compact box, which may be attached to the dash or other parts of the machine, and two screw terminals are provided for connecting the leads from the battery or current generator. The cover is fitted with a lock and key. The container is made of hard wood and nicely finished.



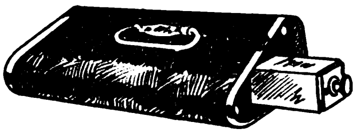
Christman Dash Lamp

The G. P. Muffler Cut-Out, produced by the G. Piel Company, Long Island City, N. Y., is made in two forms, one being fitted with flanges for the purpose of attaching without removing the exhaust pipe. The ends of the other, which is illustrated, are bored to the exact size of the exhaust piping and are provided with shoulders at either end, which prevent it from moving back or forth. A set screw locks the appliance, thus preventing movement. A feature of the cut-out is its construction, being made in two parts and held together by bolts. This permits easy disassembling for cleaning or other purposes. The construction and seating of the valve is such that it completely shuts off the line to the muffler when the cut-out device is open, and is compelled to take the correct angle for deflecting the exhaust gases. It also is claimed that when the valve is closed it cannot be reopened by the pressure of the exhaust. The sections of every part of the device are greater than that of the exhaust line, decreasing back pressure as well as intensifying the volume of sound.



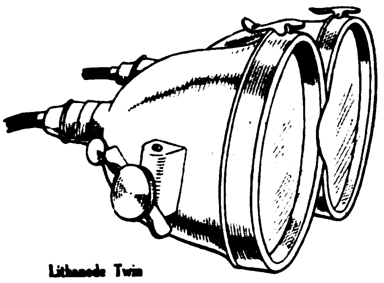
"G. P." Muffler Cut-Out

The Clark Automobile Heater will appeal to motorists who operate their cars during cold weather, as it provides a supply of heat for a considerable time, requiring no attention other than starting it and replacing the fuel. It is made in several forms; is neat, durable and compact, and so simple that it may be operated by a child. The slanting form is popular with motorists, having as it does both side and end ventilators, which may be made to throw out as much or as little heat as desired. It is 14 inches long, weighs nine pounds and is fitted with cold drawn steel ends, heavily nickel plated and covered with a high grade of Brussels carpet. As the heater is made in divers styles and covers, one may be obtained to harmonize with the upholstery of the machine. The fuel is a Clark coal, which ignites easily, and is produced in the form of a compact brick, being 7.5 by 2 by 1.25 inches. One of these briquettes is placed in a drawer in the heater, and when ignited does not flame or smoke and is free from smell during its combustion, which is slow, owing to the composition of the material. A regulating device allows the amount of heat to be adjusted to a nicety, and it is claimed that one charge will provide warmth from 12 to 16 hours. The fuel is inexpensive and comes in cartons of one dozen. The appliance is manufactured by the Chicago Flexible Shaft Company, Chicago.



Clark Automobile Heater

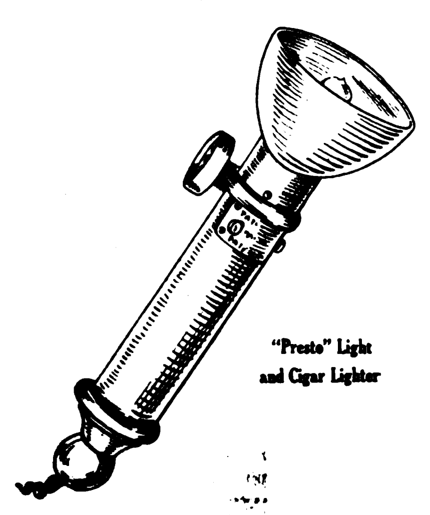
The Lithanode Twin Electric Headlight is produced in England by Longstreth's, Ltd., 190 Queen's Road, Battersea, S. W. It consists practically of two electric side lamps placed together as the accompanying sketch brings out. The arrangement is neatly and strongly made, and each bulb is provided with a separate adjustment for focusing. By means of this, it is possible to cause one-half of the lamp to project a long distance beam, while the other illuminates the side of the road, or both can be used in long distance service or diffusion as desired. The bulbs ordinarily employed are of four candlepower. When necessary the Lithanode fog-piercing amber colored bulbs may be inserted instead.



Lithanode Twin Electric Head Lamps

★

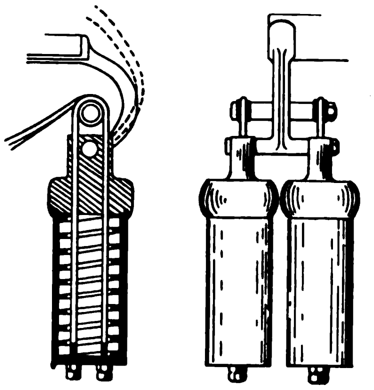
The Presto Lamp and Cigar Lighter is a novelty manufactured and marketed by the Metal Specialties Manufacturing Company, Chicago. It is a combination device as by it light is furnished while making repairs about the machine or for inspection and the acetylene gas of the head lamps may be ignited, as well as a cigar. This last named feature will appeal to motorists and motor boat owners who smoke, as lighting a cigar in the wind is a difficult feat. The lamp is portable, equipped with 10 feet of silken cord and is fitted with two press buttons, one operating the lamp and the other the cigar lighter. The latter is fitted with a platinum tip, and like the lamp may be replaced at a slight expense in the event of damage. The appliance may be attached to dry cells or a storage battery providing a current of six volts although the company manufactures outfits operated by a stronger current.



"Presto" Light and Cigar Lighter

★

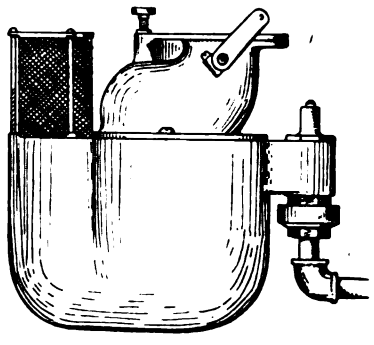
The J. M. Shock Absorber which is made in several forms to conform to the design of the car, is marketed by a company whose main office is at Philadelphia. It consists principally of a form of coil spring fitted in a tube and so constructed that all road shocks are absorbed. When attached to machines having topped C shaped springs linked to the bottom members in the usual manner, double tubes are utilized. When single springs are employed of the same type, one cylinder is sufficient. Another model is adaptable to motor cars having single laminated springs, one end of which is attached to a rigid hanger directly connected to the chassis. A third is for the rear end of the front member. The device is attached easily and without modifying the framework of the car.



"J. M." Shock Absorber

★

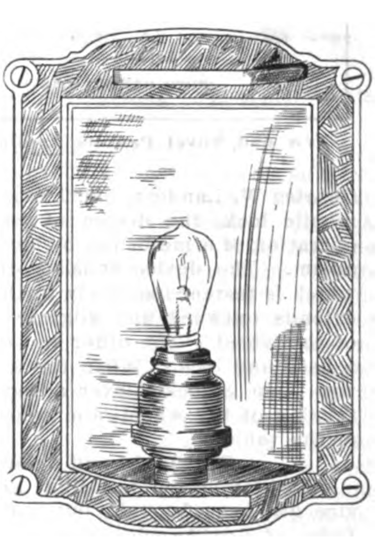
The Air-Friction Carburetor differs from the usual vaporizers as the member taking in atmosphere is fitted with a strainer which does not permit of a vacuum being formed at the spraying nozzle. The maker claims that the use of a vacuum necessitates an obstruction in the passage of the air to the motor and that this arrangement makes it impossible for the engine to secure a satisfactory fuel mixture with a wide open throttle. This is said not to be necessary with the air-friction member which is fitted with a large nozzle providing more gasoline surface to the incoming air and which has a passage around the nozzle varying in size concentrically. Because of this construction it is claimed that fuel economy is obtained as well as very low speeds on the direct drive. Another feature is that cold weather starting troubles are said to be eliminated. It is produced by the Air-Friction Carburetor Company, Dayton, O.



Air-Friction Carburetor

★

Electric Corner Lights are among the electrical novelties adaptable to the automobile and these are manufactured and marketed by C. Cowles & Co., New Haven, Conn. The device is intended for the purpose of illuminating the interior of closed vehicles. It is fitted to the corner of the car and is controlled automatically by the lever which opens and locks the door. When the latter is opened the lamp is lighted and a revolving cover exposes the light. The latter is extinguished when the door is closed and locked. and the cover to the device closes. It is neat and attractive in appearance and the frame is made of polished brass, nickel, silver or gun metal, provided with a silver reflector. It is about five by 3.5 inches. When fitted to the limousine body the lamp lights up the interior, facilitating entrance and egress of the passengers. Many costly gowns have been ruined by mud splashing on the steps. With the corner light these are illuminated, and care may be taken.



Electric Corner Light

RECENT PATENTS of INTEREST

Valve Removing Device.

A valve lifting tool, which is a departure from the ordinary construction, inasmuch as it is made in one piece and has no moving parts, has been patented by Frederick John Whitelaw, Toronto, Canada. It consists of a bifurcated member adapted to span the valve stem and having beveled upper edges which tend to raise the retaining washer. The bottom part of the instrument is straight and this slides on the valve guide bushing, the movement raising and compressing the valve spring because of the sloping upper edges of the device. The double end of the lifter is open, said aperture being utilized for the purpose of reaching and removing the cotter pin or key retaining the valve spring washer. The remover is made of flat metal and it is claimed that it can be operated successfully on any type of motor.

Steering Wheel Lock.

A patent has been granted to Walter G. Sachs and Charles W. Landers, San Francisco, Cal., for an automobile lock, the design of which is to prevent the operation of a motor car by locking the steering mechanism. The device consists of an arm, one end of which is fastened securely to the steering column, and extends outward and slightly upward to the spokes of the wheel. The other end of the extension carries a hasp and lock. When the automobile is not in use this hasp is locked over a spoke which prevents the turning of the wheel and consequently the operation of the vehicle.

CAKE TAIL LIGHT AND NUMBER
CHIPCHASE WRENCH
AMANSON AUTOMOBILE HEADLIGHT
KNIGHT ICE MOTOR-CYCLE

New and Novel Patents Applicable to the Motor Car Including Movable Headlights, Wheel Locking Device, Valve Lifter, Tail Light Combination and Pipe Wrench.

Tail Light and Number Display.

A combination tail light and number display device has been brought out and patented by David S. Cake of Los Angeles, Cal., and a feature of the invention is its compactness. It is square in shape and of sufficient length to incorporate the four or more characters as well as the red semaphore. The latter is of the bull's eye type and lighted by electricity which is also employed to illuminate the numbers. The device is suspended from the automobile by means of straps, these being attached to staples. The construction of the light is such that the numbers may be changed easily and the plate bearing these is held by a spring attachment, which prevents rattling.

Movable Headlight Mechanism.

One of the disadvantages of fixed headlights on the motor car is that in rounding corners the light does not cover the road properly; that is, the car has to be turned before the highway in front of it can be illuminated. A swivelling device has been patented by Lyman O. Amanson and Milton H. Ulrich, Miller, S. D. Its construction is simple and is said to be free from rattles and is adjustable. It is operated by the steering knuckle, to which a tube is attached and leads to a vertical rod, both being pivotally mounted. The latter is connected to another member joining the two lamps and when the front wheels are turned either to the right or left, the motion imparted by the steering knuckle is communicated through the tube and rod to lights, casting beams in proper direction.

Chain Pipe Wrench.

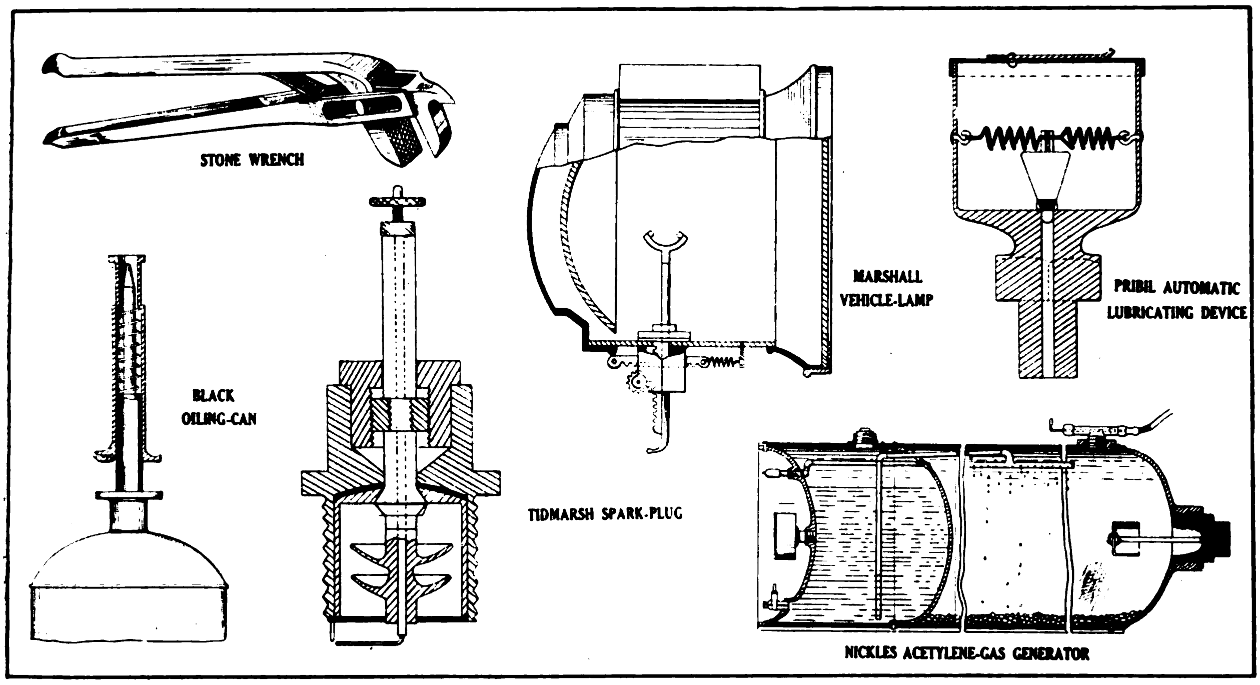
An adjustable pipe wrench has been patented by John Chipchase and Alfred Ernest Metcalfe, Newcastle-upon-Tyne, England. It comprises a lever or arm having a round curved nose at one end and rack teeth on the back for the purpose of engaging a movable pawl, and a chain. One end of the latter is secured to a movable link which is attached to the head of the arm, while the other is free. The yoke carrying the pawl slides freely on the lever and is fitted with a swiveled hook designed to engage with the chain. When utilized on piping the flexible block chain is coiled around the part, the free end passed through and between the arms of the movable link, and attached to the hook of the yoke member. The latter is then slid backward until the chain grips the pipe firmly. When pressure is applied to the handle of the lever the round nosed end compresses a link against the pipe. Being adjustable the size of the member to be gripped is limited only by the length of the chain.

Ice Motorcycle.

Frank Knecht of Lancaster, O., has been granted a patent for an ice motorcycle which comprises the ordinary road mount minus the front wheel, fitted to runners, these being attached to the frame. The front member is movable permitting steering of the device when in operation. The rear or driving wheel is equipped with spikes for the purpose of providing traction and the arrangement is such that it is controlled by means of a lever situated convenient to the driver. A rack bar is attached to the frame and adapted to engage the forward end of the lever which is movable. The rear wheel is supported by a frame and driven by a belt in the usual manner. By means of the lever mechanism the driving wheel may be raised or lowered, this arrangement permitting the spikes to sink more or less into the ice, according to the condition of the surface to be traversed by the machine.

Acetylene Gas Generator.

An acetylene gas generator cylindrical in form and similar in shape to the regular gas tank, has been patented by Clair Arthur Nickles, Ponca, Okla., assignor to Clair A. Nickles and Ira Edgar Horack of the same city. Acetylene is produced by the dripping of water upon the calcium carbide, but instead of one or two feeds, several are employed. The container is divided into two compartments, one being utilized for water and the other for the carbide. A tube leads from the former into the gas section and is attached to a horizontal pipe provided with a number of openings. Another tubing and a pop valve are located in the recessed portion of the tank and are in communication with the carbide chamber. The object of the valve is to maintain a maximum working pressure in the water chamber, as well as to start the device. A pressure gauge also is fitted and piped to the water chamber. A service opening is attached to the top of the tank and includes a shut-off valve. Carbide is introduced through an opening closed by a screw plug and a similar device is utilized on top of the water compartment. The pressure of gas is maintained by the communication between the chambers, the gas passing alternately to each, when the normal pressure in either drops below that in the other. A second pop valve is in line with the tubing leading from the gas chamber, and the device is set to blow off at about the maximum working pressure of the generator. The first is adjusted to resist a pressure greater than that of the other member.



Some Recent Patents Applicable to the Motor Car, Including Wrench, Adjustable Headlight, Acetylene Gas Generator, Oiling Can Protector and Automatic Lubricator.

Marshall Vehicle Lamp.

A patent has been granted to William C. Marshall of New Haven, Conn., for an automobile headlight which is provided with means for adjustment as well as changing the focus. The lamp consists of the usual members, the mirror and casing being composed of glass and metal. The burner holding device, instead of being set and fastened as usually is the case, is so arranged that it may be moved backward or forward, and up or down. The tube to which the burner is attached is fitted with flat extensions and these, when in a normal position, are flush with the bottom of the casing. The part that extends through the latter is fitted with a rack. Attached to the base of the burner member is a pinion so arranged that it meshes with the rack that moves the burner longitudinally. This allows the light to be moved vertically or horizontally and it is claimed that a fine focus may be obtained, as well as movement of the light to prevent undue glare. A spring is attached to the rack and casing for the purpose of returning the former to its normal position.

Automatic Lubricator.

The problem of properly lubricating parts subjected to friction has been solved by many ingenious methods, some of which are of the automatic type. A new design of the latter has been invented by Adolphe Pribil of Paris, France. The device resembles in outward appearance the round grease cup and is constructed along the same lines. From the interior of the vessel extends a duct which leads to the part to be lubricated and into this opening fits a wedge-shaped member which is shaped at both sides in the form of rollers, and has one or more weights connected. This mechanism is attached to a spring which is fastened to the sides of the container. The tension is such that any motion imparted tends to rock the closing member, allowing the lubricant to pass into and out of the duct. The device has a lid for the purpose of replenishing the supply and among the claims advanced is that it is adapted to parts requiring lubricant while in motion.

Tidmarsh Spark Plug.

A novel form of spark plug has been patented by

William H. Tidmarsh, Elgin, Ill., and its construction varies from those of the ordinary form, inasmuch as the insulated member carrying the electrode is of peculiar design, having as it does, extensions or shields in the hollow portion of the metal body. The latter is recessed to take the insulating conical section of the stem which extends upward and through the locking member, and attached to the end is the usual terminal. Gaskets are interposed to render the plug compression tight and the arrangement of the parts compressing these is such that the conical section is drawn snugly into the recessed portion through the movement of the locking member which acts upon a part attached to the insulating stem, and both of these are threaded.

Stone's Adjustable Wrench.

A patent has been granted to Charles E. Stone of Boston, assignor to E. H. Corson of the same city, for a combination wrench which presents interesting features. The handle portion includes a jaw extending at right angles and is recessed for another similar member which moves by means of a pin integral therewith working in slots. This pin acts as a fulcrum and a series of notches is provided for its engagement. A spring is interposed between the handles and is attached to the upper member.

Guard for Oiling Can.

Owing to the light construction of the spouts on some oiling cans these hollow members are damaged easily and when carried in the tool compartment of the motor car are often bent by coming in contact with other metals. The opening is also more or less liable to become stopped up by foreign elements. Charles E. Black of Cincinnati, O., has taken out letters patent for a device which should overcome these troubles. A protecting guard is placed over the spout and when in its natural position prevents injury to the member. A spring is fitted and one end is attached to a shoulder on the spout and the other fits a recess in the tube. The latter carries a pin which moves freely in another recess in the spout. To utilize the container the guard is depressed which movement brings the end of the spout above it.

In measuring either wire or sheet metal a number of gauges are used and it is important to know in what each differs from the other. In this country the B. & S. and U. S. gauges are generally employed, and even in these there is considerable variance, so that in ordering sheet metal or wire it is important to specify the gauge employed in measuring. The table above will serve to make comparisons between the various standards, and the mechanic may determine by micrometer measurement the size and gauge of the wire or sheet metal at hand.

DIMENSIONS AND STRENGTH OF ROLLER CHAIN.

Pitch of chain in inches	Diameter of roller in inches	Width of chain in inches	Breaking stress in pounds
1.00	.5625	.375 and .500	5000
1.25	.6250	.500 and .625	6500
1.50	.7500	.625 and .750	9000

DIMENSIONS OF SPROCKETS FOR ROLLER CHAIN

Number of teeth in sprocket	1" pitch Pitch diameter	1.25" pitch Pitch diameter	1.5" pitch Pitch diameter
7	2.31	2.88	3.46
8	2.61	3.27	3.92
9	2.92	3.65	4.38
10	3.24	4.04	4.85
11	3.54	4.44	5.33
12	3.86	4.83	5.79
13	4.18	5.22	6.27

16	5.12	6.41	7.69
18	5.76	7.21	8.64
20	6.39	7.99	9.59
22	7.03	8.79	10.55
24	7.66	9.58	11.49
26	8.31	10.38	12.44
28	8.95	11.19	13.42

Chain driven motor cars in daily use are sufficiently numerous to make the tables above of distinct value to the motor car mechanic, one of these considering the dimensions of the sprockets, having different numbers of teeth for roller chains of the pitch most commonly used in motor car driving. The outside diameter of a sprocket can be found by adding the diameter of roller to the pitch diameter, while the bottom diameter can be determined by subtracting the diameter of the roller from the figure given for the pitch diameter. The table showing breaking stress is also practical, the figure given being for a constant strain as indicated, or any intermittent stress up to the figures presented for the different sizes. A chain should be used which has an ample factor of safety, as it will soon fail if worked up to the limit of endurance.

Drip Feed Generators—There are still a good many acetylene generators on the market worked by an adjustable water drip, and under the influence of vibration the threaded rod adjusting the quantity of the water is rather apt to work down and reduce the supply. This tendency is easily prevented by slipping a small spring between the rod and the top of the generator. This simple expedient has converted many very exasperating generators into perfectly satisfactory affairs as the drip-feed rod then remains where it may be set.

SIZE OF REAMER AND TAP SHANKS.

In the use of hand tools by the machinist, he has considerable work with both taps and reamers. These come in a variety of sizes and shapes, to keep track of which is almost impossible. With an idea of helping in this confusion the accompanying table of straight shank sizes has been prepared. This gives the diameter of the round, straight portion, and width across the flat of the squared end, both of which must be known in the selection of a wrench to handle them.

Diam. of shank d	Square s	Diam. of shank d	Square s	Diam. of shank d	Square s	Diam. of shank d	Square s
.0625	.0468	.6875	.5156	1.3125	9.844	2.3750	1.7812

Squares on Shanks of Reamers and Taps.

The square size in particular is very useful to know and remember. In later issues, other tap, reamer and drill sizes will be given, the whole making a set of invaluable note book sheets for the ambitious garage or machine shop worker.

Formation of Acetylene Gas—It is not generally known that in the formation of calcium carbide, from which is produced acetylene as it is called, lime and carbon are united under great heat. The first element furnishes the calcium, from which the carbide is made by chemical union with the carbon. One portion of the former to three of the latter produce an element of carbide and another of carbonic oxide, which passes off in the process as a useless gas. When the residue has been crushed to a powder for the commercial form, it is combined with water, as in the ordinary generator. The addition of oxygen in this, of which there are two parts to one of carbide, forms a resultant gas, which is lost, water which is left over, and the desired acetylene, which is produced by the combination of the carbon and hydrogen.

MECHANICALLY OPERATED VALVES.

In designing an engine, or rebuilding, it is often desirable to know the best size valve to use to obtain a certain number of revolutions per minute. In the table below the proper sizes for cylinders from three to six inches bore are given. The dimension specified is the diameter of the valve opening or port and not of the valve head, which will obviously be about one-fourth inch larger than the opening, to allow of sufficient metal for seating. Under the columns denoting piston speed per minute will be found the number of revolutions an engine of certain piston travel must make in the same length of time to produce the piston velocity indicated. For automatic inlet valves, the diameter should be increased by 20 per cent.

		Piston speed in feet per minute					
		600		750		900	
Bore of cylinder..	Stroke	Revolutions per minute	Diameter of valve opening	Revolutions per minute	Diameter of valve opening	Revolutions per minute	Diameter of valve opening ....
3	3	1200	0.72	1500	0.90	1800	1.08
3.5	3.5	1030	0.84	1285	1.05	1570	1.26
4	4	900	0.96	1125	1.20	1350	1.44
4.5	4.5	800	1.08	1000	1.35	1200	1.62
5	5	720	1.20	900	1.50	1080	1.80
5.5	5.5	655	1.32	820	1.65	965	1.95
6	6	600	1.44	750	1.80	900	2.16

Temperatures for Hardening—The following table gives the required temperature in Fahrenheit degrees to produce certain colors, when tempering hardened steel:

Lathe, shaper and planer tools:
    430. Very light straw.
    450. Light straw.
Taps, dies and wood turning tools:
    470. Dark straw.
    490. Very dark straw.
Hatchets, chisels, etc.:
    500. Brownish yellow.
    520. Yellow, tinged with purple.
    530. Light purple.
Springs:
    550. Dark purple.
    570. Dark blue.

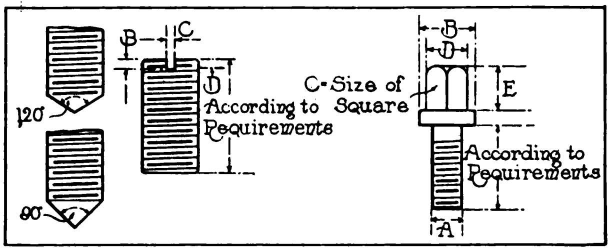
Molten Metals Produce Desired Heat—The following table gives the proportional parts of lead to one pound of tin, which, when melted, will have the required temperature to produce certain colors on hardened steel, by simple immersion:

Color.	Temperature F. Degrees.	Proportions.
Very light straw..............	430	1¾ to 1
Light straw	450	2⅛ to 1
Dark straw	470	2½ to 1
Very dark straw...............	490	3½ to 1
Brownish yellow...............	500	4¾ to 1
Light purple	530	7½ to 1
Dark purple	550	12 to 1
Dark blue	570	25 to 1

Hardening Steel Tools—One of the best, if not the best compositions for hardening steel tools for cutting iron or wood, or even steel, is the following: To one gallon of common fish or whale oil add one pound each of beeswax and resin. When this has been thoroughly mixed by boiling and stirring, heat the steel until the scale rises a little; then immerse in the boiling oil. When cool, heat over a clean fire until cherry red in the dark. Care should be taken as to the amount of resin in the oil, since resin hardens steel, whereas beeswax and tallow toughen it. If it is preferred to temper in daylight, clean the steel, polish it, and draw to a deep straw color.

SIZES OF SET AND COLLAR HEAD SCREWS.

The use of headless screws for holding collars, gears and similar parts upon rotating or stationary shafts is rapidly increasing, while in jig and fixture work, many collar head screws must be utilized. The former are pretty generally understood, which is not the case with the latter, but the dimensions of neither one are common property. Consequently, this issue will concern itself with the proportions of both for addition to our fast growing mechanic's handbook, the sheets for which are published in various issues. In both, the length varies with the requirements, following the general sizes brought out for square and filister headed screws some time ago. In measuring these, the set type includes the overall dimensions, while in the other form, only the distance under the collar is taken.



From these two tables and the small figure which accompanies them, anyone should be able to figure out the size wanted, either when purchasing or when it is necessary to make a few screws, but which it is desirable to have of a standard size for reasons of interchangeability.

Table 1—Headless Set Screw Proportions.

Glass Polishing Powder—A preparation in powder form which may be used to clean up or polish the surface of fine glass such as costly mirrors, etc., may be made by rubbing calcined magnesia down with pure benzine. This must be continued until the mass formed is sufficiently soft to allow drops of liquid to be pressed out of it. Since the benzine is so very volatile, the mixture must be kept in closely stoppered bottles, preferably those employing ground glass. To use, a little is placed on a wad of cotton or soft rag and the glass rubbed with it.

New Battery Components—A type of Leclanche battery has been produced in France, in which the sal ammoniac electrolyte previously utilized is replaced by chloride of manganese. The claims for the new form are: Holds up much better, has no consumption or open circuit, and can be short circuited without harm. The internal resistance is low and the effective yield is very large. In addition, the liquid does not freeze, while an exhausted form may be regenerated by charging from the outside, hitherto a perquisite enjoyed by the so-called storage cells only.

CHOKED SILENCERS.

In their efforts to obtain a quiet exhaust, many manufacturers employ a form of muffler which necessitates the passage of the exhaust gases through a number of small holes. It has been pointed out before in various articles that a considerable loss of power may be experienced owing to these small holes becoming clogged by the burnt oil and other residues from the engine. The remedy for this loss of power is, of course, to take the silencer to pieces and clean the holes, but, although the directions to obtain the desired end are very concise and occupy very few words, the time occupied in taking a silencer to pieces, cleaning and refitting it, often amounts to hours; this is in consequence of the threads of the various screws and bolts holding the portions together having become burnt or rusted. Having experienced the necessity to clean these holes in the baffle plates of my silencer two or three times in the course of six months, I determined to enlarge them permanently by reaming them out, so that the necessity for cleaning the holes would not arise so often. I fully expected that the exhaust would be considerably more noisy, but at any rate, so far as the occupants of the car are concerned, no difference has been noticed, although a distinct improvement in the engine power has been apparent. It would appear that the mufflers of some engines waste too much power to obtain a silent exhaust.—F. S., in Autocar.

Working Aluminum—The average machinist does not have the same opportunity to machine aluminum as steel, wrought and cast iron or brass and may be in doubt as to the best methods of doing the work. The metal should be worked dry in most cases, except in tapping or when a fine finish is needed when turning. In this case a very light chip is taken and the metal is lubricated with turpentine from time to time. Aluminum, in common with other cast metals is lifeless; that is, long curling shavings cannot be taken off it as with steel, but the metal is removed in a shower of small chips as in cutting cast brass. The metal is easily torn, especially in turning and in cutting threads in a lathe, where the tool may dig in unless handled with care and rip out rough threads. For a nice surface finish, either in lathe or planer use a broad tool with a light cut. Aluminum can be cut as fast as brass if a light chip is taken.

Fine Tungsten Wire—A very fine wire may now be produced from tungsten by the use of the electric furnace. The new method permits of drawing a much finer and more rugged wire than the sintered filament. Previously, tungsten particles have been welded into a continuous filament by passing an electric current through a binding material containing the metal in very fine form. After that, the binder was driven off by extremely high temperatures.

Where oil will not act as a cooling agent on a drill working in hard metals, turpentine used instead will permit the drill to take hold and retain its temper.

To anneal steel for filing and drilling, heat to a low red and bury in slack lime, ashes or forge dust and let it cool gradually.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS

The following companies have been incorporated recently to deal in motor cars, accessories, etc.:

The H. & C. Garage, New York City; capital, $10,000; incorporators, Louis S. Hallowell, 104 W. 61st street; Herbert S. Cole, Arthur J. Cole.

Sloane Aeroplane Company, New York City; capital, $30,000; incorporators, John E. Sloane, Addison A. Van Tine, 55 Liberty street; Harold Van Tine.

Royal Automobile Machine Company, Brooklyn, N. Y.; capital, $10,000; incorporators, Sydney Solomon, Celia Rothstein, Louis B. Bridsky, William M. Abel.

F A. L. Auto Company, Chicago; capital, $2500; incorporators, Frederick C. Harbour, Clinton S. Lamb, E. M. Lundberg.

Hart Motor Car Company, Chicago; capital, $10,000; incorporators, Frederick P. Hart, Karl Bylngton, Charles G. Stohrer.

Orrin Ray, Inc., Boston; capital, $50,000; incorporators, Harry O. Ray, Alfred R. Greendelle, Willis N. Tuller.

Kincaid Oil Company, Providence, R. I.; capital, $25,000; incorporators, William T. Kincaid, William C. Rodger, Frederick P. Scott.

E. S. Hutchin Auto Company of Kansas City, Kansas City, Mo.; capital, $10,000; incorporators, E. S. Hutchin, William Harmon.

The Boulevard Company, Waterbury, Conn.; capital $5000; president, William E. Russell; vice president, Lizzie E. Russell; treasurer, Albert Delay; secretary, Charlotte M. Delay.

White Garage Corporation, Los Angeles, Cal.; capital $100,000; incorporators, F. Fay Sibley, Martin E. Tew, R. Roy Sibley, C. M. McCully, E. L. Sibley.

Pittsfield Auto Garage Company, Pittsfield, Mass.; capital, $3000; incorporators, Mary I. Mills, Arthur A. Mills, Arthur J. Mills.

Morse, McDonald Company, Boston; capital, $15,000; president, John S. Morse; treasurer, John D. McDonald, 80 Chandler street.

Lawrence & Stanley Company, Boston; capital, $2000; incorporators, Richard F. Stanley, president; Herbert M. Lawrence, 77 Sawyer street, Dorchester, treasurer; Orlando Lawrence.

Stover-Lang Company, Boston; capital, $40,000; incorporators, George H. Lang, Charles L. Stover, 221 Columbus avenue; Norman F. Pratt.

The Motor Accessories Manufacturing Company, Marshalltown, Ia.; capital, $10,000; incorporators, Charles C. Eldridge, Edwin J. Beebe.

GARAGE & DEALER

Roy F. Lovejoy, Lowell, Mass., has taken the agency for Hudson cars, made by the Hudson Motor Car Company, Detroit, and will maintain a completely equipped repair shop as well as carry a full line of supplies.

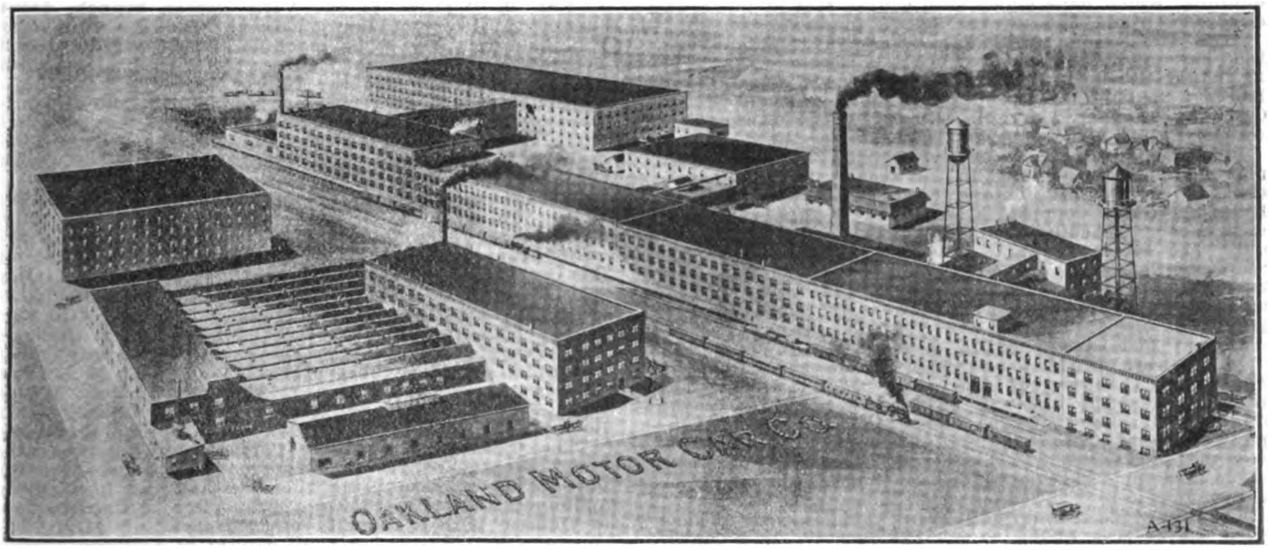
The A. G. Guy Company, Worcester, Mass., agent for lubricating oils, has taken the agency for the Cutting line, made by the Clarke-Carter Automobile Company, Jackson, Mich.

Kirby & Barrett, Hartford, Conn., has leased quarters at 30 High street and these will be remodelled for a salesroom. The concern will maintain its garage on Main street.

The Otto Garage Company, Manistee, Mich., has been organized to take over the business of the Brugman Bros. The following officers of the new concern were elected recently: President, J. L. Sweetnam; vice president, J. H. D. Wallace; secretary and treasurer, B. P. Barnes.

F. H. Edwards, Watertown, N. Y., agent for the Maxwell line, closed a contract recently for an enlargement of his garage at 171 Stone street in that city. The new building will be utilized also as a repository for parts made by the United States Motor Company, New York City, maker of Columbia, Stoddard-Dayton, Maxwell, Brush and Sampson cars.

William Knipper, Rochester, N. Y., the well known racing driver, has taken the agency for the Stutz car, made by the Ideal Motor Car Company, Indianapolis, Ind.



Recent Additions to Plant of Oakland Motor Car Company at Pontiac, Mich., Creating Fifteen Acres of Floor Space.

The Cadillac Automobile Company, New York City, has leased a one-story brick building in the process of erection near 26th street. The property has a frontage of 100 feet and will provide, approximately, 14,000 square feet of floor space.

J. M. Wolf and Emil Bolins have organized the Fairmount Motor Company of Fairmount, Minn., and will occupy a building which will include a salesroom, office and repair shop.

The Duncombe Auto Company, Fort Dodge, Ia., has postponed the erection of its new garage until spring because of the inclemency of the weather. The new structure will cost $10,000 and will be three stories in height and of cement blocks.

William Parkinson, handling the Stutz line, has leased a salesroom at 1655 Broadway, New York City. The concern will be known as the Stutz Motor Car Company.

A. H. Sowers has joined the Boston sales agency of the Jackson line, made by the Jackson Automobile Company, Jackson, Mich. He was formerly a member of the Sowers-Soden Company of that city.

Col. Grantley P. Postles, Wilmington, Del., has leased the garage and show rooms at 220 West Tenth street and has associated himself with Coleman B. Harris, agent for the Cadillac car. The concern will also handle a full line of electric and gasoline pleasure and commercial vehicles.

Henry P. Bryant has acquired the interest of Harry Garrison in the Marshall Motor Company of Marshall, Mo., and will have charge of the entire business hereafter.

The Merchants Auto Company, Indianapolis, Ind., has leased for a term of years, the newly erected garage at 9 East Pratt street, known as the Colonnade. A change is announced in the management, E. Frank Brown succeeding H. B. Stout, Jr.

D. T. Potter of Bowling Green, Ky., has entered the employ of the Phoenix Motor Car Company of Lexington, Ky.

The Virginia Automobile Garage & Repair Corporation, organized recently, has opened a garage and repair shop at 158 West Main street, Norfolk, Va. The officers of the company include: President, H. L. Page; vice president and general manager, Archie M. Bopp; secretary and treasurer P. A. Page.

Reginald Thomas, who drove one of the Metz cars in the recent Glidden tour, has joined the sales force of the Hollander Company, Boston distributors of that line, made by the Metz Company, Waltham, Mass.

Roscoe B. Davis, well known in motor car circles in Boston, has joined the sales force of the Empire Motor Company of that city. In addition to the Empire the company acts as distributor of the Stutz car.

B. Black & Son, Thomasville, S. C., has secured property on Main street and will erect a building suitable for the repairing and handling of motor car tires.

A. L. Starin of New Haven, Conn., is having plans drawn for a garage at Broad and Commerce streets in that city. It will be a brick structure, two stories in height of steel and concrete.

The American-Marion Sales Company, New York City, moved recently from 1776 Broadway to new quarters at Broadway and 63rd street. A formal housewarming will be given.

H. H. Snyder, Bozeman, Mon., has taken the agency for the Day line, made by the Day Automobile Company, Detroit.

The Buick-Keating Company, consisting of P. L. Keating of Oswego, and J. O. Bradeen, has been formed at Syracuse, N. Y., to handle the Buick line, made by the Buick Motor Company, Flint, Mich.

Frank Staley of Pittsfield, Mass., has closed a contract with the Hupp Corporation of Detroit, for the distribution of the new R. C. H. cars in Indiana and part of Illinois. He will establish headquarters at 513 North Capital avenue, Indianapolis, Ind.

The Simplex Automobile Company, New York City, announces that it will move to new quarters in the Ehret building, 59th street, east of Broadway.

Coughlin & Davis, Seventh avenue and Walnut street, Cincinnati, O., have installed machinery for the purpose of repairing speedometers. The department will be in charge of E. R. Marsh, who served some time with the Stewart & Clark Manufacturing Company, Chicago.

George W. Garland, Jr., has taken over the interest of Edward and George Strobel in the Garland Automobile Company, 1657 Broadway, New York City.

S. A. Foster & Co., Hartford, Conn., agent for the Rambler, Regal and American cars, has removed to a new garage and repair shop at 20 Elm street. The new location provides an excellent salesroom.

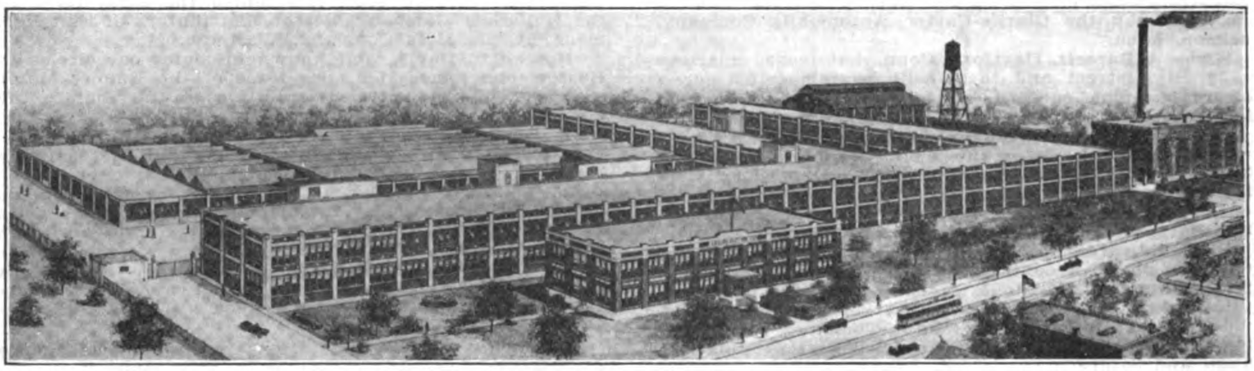
L. Kirkegard, Sioux City, Ia., has opened a garage and repair shop and will represent the Oakland, R. C. H., and Firestone-Columbus.

Leiss & Curtis has opened the Empire Garage at 124 Main street, New Rochelle, N. Y. Both members of the firm have had a long experience in the motor car industry, Mr. Leiss having had a garage at 232 Cedar road.

Ralph S. Jones has purchased the business of the Fishkill Motor Car Company, Fishkill Landing, N. Y., and the garage which is undergoing alterations. C. F. Aldridge will be manager and J. J. Wedick will have charge of the mechanical department.

WITH THE MANUFACTURER

The Bosch Magneto Company, New York City, announces a change in offices whereby the advertising and publicity department will be located at main office, and that at 54th street will be discontinued. A. H. Bartsch will be in charge as heretofore. The change has been made possible by extensive alterations throughout the building, which have added 5000 square feet of much desired office room, and required by the increasing business.



Detroit Plant of the Losier Motor Company Which Is Constructed of Concrete and Steel and Where Over 1000 Men Are Employed.

The Henderson Motor Sales Company, Indianapolis, Ind., has appointed the following new Cole agencies: W. R. Griffin, Stockton, Cal.; Leadley Brothers, Rozel, Kan.; Herbert Ellis, 24 Amesbury street, Lawrence, Mass.; Gist Auto Company, Arcadia, Ind.; Kewanee Garage, Kewanee, Ill.; R. Bruce Carson, Hagerstown, Md.

The Losier Motor Company, Detroit, maintains two plants which are depicted in the accompanying illustrations. The Detroit factory is constructed under the Hahn steel and concrete system and is fitted with the most modern machinery, all of which is less than a year old. The Pittsburg plant produces the iron, steel and aluminum castings and employs over 600 hands. The rear axles, hubs, pumps, etc., are built here and it acts as a feeder to the main works. Over 1000 men are employed at the latter and the combined output is estimated at 1000 cars annually.

C. F. Pratt, president and general manager of the Ohio Motor Car Company of Cincinnati, O., announces that the Ohio gasoline line will be handled hereafter in the Canadian territory by the American Motor Sales Company, Toronto. Ground already has been broken for a new building which will house the Canadian concern and serve also for a factory service station for the Ohio machine.

The New York Lubricating Oil Company, New York City, states that owing to a large increase in business in the Middle West, the branch in Chicago at 1436 Michigan avenue has been removed to 1549, where larger quarters have been secured.

H. T. Boulden, sales manager of the Ohio Motor Car Company has reorganized the sales department and hereafter the service department will be under the direct supervision of the sales manager. Five factory service depots are to be established in as many parts of the country. These will carry a full line of parts and will have a factory mechanic for installation.

The Velie Motor Vehicle Company, Moline, Ill., entertained dealers, and branch house managers at a convention in that city recently. Meetings were held in the assembly hall and addresses were made by the heads of the different departments, including Chief Engineer C. B. Rose; Major L. M. Fuller, general manager; George H. Lloyd, sales manager, and his assistant, Charles P. Hatter. Later in the week a banquet was tendered the visitors at the Manufacturers' hotel, after which the party was escorted to the theatre in automobiles. Another banquet was given later at the Davenport Club, Davenport, Ia.

The Colby Motor Company, Mason City, Ia., has added Connecticut shock absorbers, made by the Connecticut Shock Absorber Company, Meriden, Conn., to the regular equipment of the 1912 30 horsepower Colby car.

Arthur H. Blanchard, M. Am. Soc. C. E., consulting highway engineer, formerly of Providence, R. I., announces the removal of his office and laboratory to the corner of Broadway and 117th street, New York City.

Ray B. Wiggins of the Velie Boston branch, drove the official pace making car in the Chicago reliability run, held recently. The machine, which carried David Beecroft, president of the Chicago Motor Club, was loaned by Morton H. Luce to the referee.

The Ohio Motor Car Company announces the appointment of the following agencies: William S. Lee, Wilkesbarre, Penn.; Zust Motor Company, New York City; Federal Motor Car Company, Pittsburg, Penn.; C. H. Dean Company, San Antonio, Tex.

Montgomery Hallowell, general advertising manager of the United States Motor Company, New York City, has resigned to join the forces of the H. E. Lesan Advertising Agency, where he will assist in the handling of the United States Motor Company's advertising. Gridley Adams, formerly advertising manager of the Stoddard-Dayton division, has been appointed to succeed him. Mr. Hallowell's associates tendered him a banquet at Sherry's and presented him with a handsome mahogany cigar humidifier. Among those present were: Alfred Reeves, Gridley Adams, H. E. Lesan, E. M. West, W. McK. White, M. J. Adams, M. H. Newton, L. A. Van Patten, Berry Rockwell, F. E. Dayton, Harry Pruden, Joseph Kathrens.

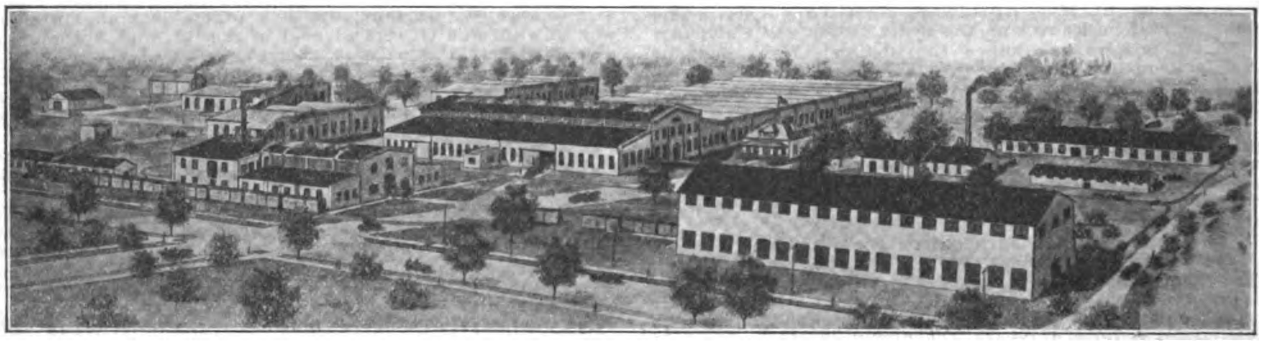
The Overland Automobile Company of Canada, Ltd., which secured Dominion letters patent in June for the purpose of manufacturing the Overland car in Canada, announces that it will build a large plant in the province of Ontario with a capacity of 1000 cars annually. The company will have a paid up capital of $250,000.

The International Automobile League Tire & Rubber Company, Buffalo, N. Y., will erect a $600,000 plant on land secured at Northland avenue and Chelsea street, according to an announcement made by its president, A. C. Bidwell. The building is expected to be completed in about four months.

H. C. Lathrop has been elected secretary and treasurer of the Henderson Motor Sales Company, Indianapolis, Ind., to succeed his father, Dr. H. L. Lathrop, who severed his active connection with the company to devote his time to the banking business.

The Oakland Motor Car Company's New York branch has removed to 1600 Broadway and will be in charge of Roger R. Hall.

Charles W. Sponsel of Hartford, Conn., has been appointed factory manager of the Pierce Motor Company. The manufacturing plant is located at Racine, Wis.



Pittsburg, Penn., Factory of Losier Motor Company Which Produces Units Assembled at Detroit.

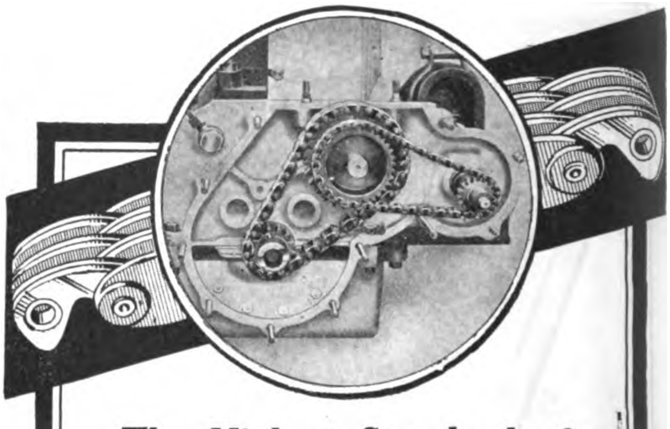
AGENTS
Proposition
For Live Dealers
EAGLE OIL & SUPPLY CO.
104 Broad Street, Boston, Mass.



The Highest Standard of Efficiency

in magneto, camshaft, and pump drives is reached by the application of the economical, reliable and silent

Coventry Noiseless Chains

The precision, automatic retention of pitch and long life are a few of the facts taken into consideration by many manufacturers of the most silent, reliable, and fashionable cars who fit these chains exclusively. The services of our experts are at your disposal.

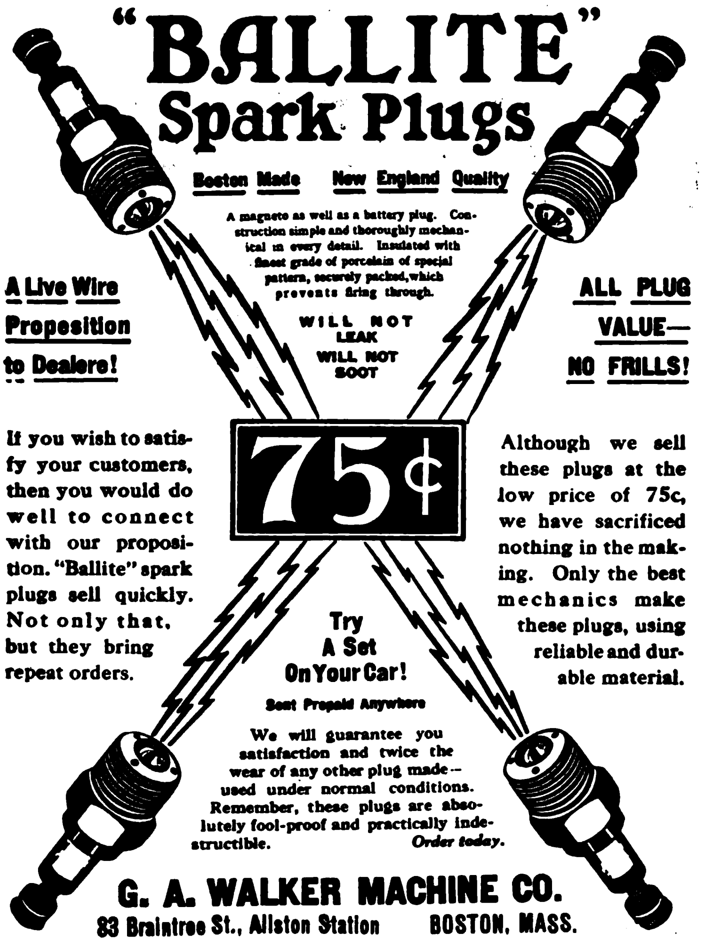
UNITED STATES REPRESENTATIVES:
S. Hoffnung & Co., Ltd.
118 Broad Street, - NEW YORK



"BALLITE" Spark Plugs

Boston Made New England Quality

A magneto as well as a battery plug. Construction simple and thoroughly mechanical in every detail. Insulated with finest grade of porcelain of special pattern, securely packed, which prevents firing through.

WILL NOT LEAK
WILL NOT SOOT

A Live Wire Proposition to Dealers!

ALL PLUG VALUE—NO FRILLS!

If you wish to satisfy your customers, then you would do well to connect with our proposition. "Ballite" spark plugs sell quickly. Not only that, but they bring repeat orders.

75¢

Although we sell these plugs at the low price of 75c, we have sacrificed nothing in the making. Only the best mechanics make these plugs, using reliable and durable material.

Try A Set On Your Car!

Sent Prepaid Anywhere

We will guarantee you satisfaction and twice the wear of any other plug made—used under normal conditions. Remember, these plugs are absolutely fool-proof and practically indestructible. *Order today.*

THE ACCESSORY -AND- GARAGE JOURNAL

Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. I. PAWTUCKET, R. I., FEBRUARY, 1912. No. 4

PUBLISHERS' WILD DASH FOR "TRADE."

Publications Long Devoted to Other Interests Stampede at the Recognition by Some of the Industry of the Real Merits of the "Glad Hand" and "Goodfellowship"--Policies Changed in Twinkling.

THE trade publications, the fields they fill, the needs they serve and the purposes they accomplish, are receiving the attention of the large interests of the motor vehicle and allied industries. Careful inquiry has been directed toward all of these prints, largely because of the representations made relative to them by those responsible for their conduct. This investigation, if such it may be termed, has resulted from a condition precipitated by the lightning changes made by some of the publishers to establish claims for recognition.

And primarily it all depends upon what is and what is not as applied to the purpose or character of the print. There are numerous classifications, these including those for the owner, for the industry as represented by the manufacturers, for the trade as representing the agents and distributors for cars, and for the entire industry by including all these interests save the owners. Now it is well enough known that of these classes there are those which essay to be either general or sectional in their scope, and that of these divisions there must be a substantial reason for recognition to be given by the public.

There has been recently a disposition by some of the largest purchasers of publicity to devote their inquiries toward the especial fields of some of the prints that are published in the metropolis, and this, together with the mystifying transitions of the publishers, has brought about a situation as peculiar as it is bewildering. For reasons that do not need specification, publications that were very strong in their claims to distribution among owners of motor vehicles, in the twinkling of an eye became the strongest of trade prints, and, seemingly without realization by the industry that to become established and secure actual prestige is a work for years.

There is nothing remarkable in a change of policy with the average magazine, but it is absolutely impossible for a publisher to make what he pleases, when he pleases and where he pleases. It requires long periods of endeavor to establish clienteles of readers and advertisers and there must be a sufficient and continued interest by either element. To change from one class to the other is an undertaking that must be thoroughly prepared for and then, more important than anything else, the public, not the advertisers, must be thoroughly informed.

That the public must be dealt with is evident from the fact that any publication, no matter how well supported by advertisers, would be a failure without readers, because it would not afford such publicity as would warrant advertising support. This being so it is simply an impossibility for a magazine to be transformed as has been stated, and have a publicity value that would justify its receiving recognition. Not only this, but it must also be apparent that there could not have been the merit and quality claimed for the print in its first form, for had there been there would be comparatively little, if any, reason to make the complete change of policy.

Yet on the face of these indubitable facts it is evident that the experience of the industry, as reflected by the publications referred to, has been quite the reverse, for, with the activity of one magazine to secure recognition by the trade, others with remarkable alacrity "threw their hats into the ring" and stampeded for the "trade," leaving the "owners," "general," "national" and other interests dead, dying or willing to die. That is, there was a mad rush for the "trade" because of the seeming success of the first print in securing business. With all this came the creation of expensive organizations of advertising solicitors, whose principal occupation appears to be keeping out of each other's way, and visiting the advertisers and soliciting "copy" on the basis of "personality" and a handshake—not upon the merit of the publications as mediums for publicity.

This condition (the friendship call and the goodfellowship) might be expected to bear fruit once or twice, but it is hardly probable that any business enterprise is a charitable institution and can afford to continue this indefinitely. Yet, surprising as it may appear, there has been a greater realization upon the "trade" representation than might be expected, a sufficient indication that there is by no means the attention directed toward the selection of publicity that should be given.

Perhaps it may not have occurred to the advertisers that there is a limit to the expense that can be legitimately incurred, because no matter how much business was secured if it was at a prohibitive cost there would at least be loss to the publisher. There may be instances where an organization may be created for development of business, and its activity may add stimulus to competition, but it is seldom, if ever, that the cultivation of one element of an in-

For Additional Trade Information See Pages 36, 37, 38, 39, 40.

dustry will result in a "Klondike-like" dash that has seemingly firmly established these publications removed and remote from those interests they formerly served.

But no matter what conclusions may be reached by the observer it is a fact that "trade" seemingly means anything desired, and does not imply the publication of trade information when applied to a magazine. Of course industrial intelligence may not have to all the same relative importance, but it is neither practical nor logical to make claim to an attitude or prestige without at least a substantial foundation. It is also apparent that the interests of the "trade" are so large that the scope of the publication devoted to it must be broad enough to include them all if it is desired to justify a united support.

WANTS FOUR-WHEEL DRIVE PATENTS.

General Electric Company Negotiating for Church Balance Gear Rights.

THE General Electric Company, the largest concern of its kind in the world, is negotiating with M. B. Church of Grand Rapids, Mich., with a view of acquiring the six patents covering the four-wheel drive system owned by the Church Balance Gear Company, Grand Rapids, Mich. Mr. Church's prominence is due to the fact that he is owner of the controlling interest in the company. The most important of these patents is No. 856,943, issued to M. B. Church and Karsten Knudsen June 11, 1907, which relates specifically to the device that evens or equalizes the application of the motive power. The Couple-Gear Freight-Wheel Company, Grand Rapids, has exclusive license to construct industrial vehicles under the patents, and this concern is a large factor in the negotiations.

The General Vehicle Company is a subsidiary corporation of the General Electric Company, and the former named concern is probably the largest maker of electric motor service wagons in America. The Church patent covers individual motors attached to the four vehicle axles and these motors turn shafts extending to the inner circumference of the wheels, the shafts carrying pinions that mesh with racks incorporated with the inner face of the rims. Instead of the usual spokes the wheels are composed of two large discs to which are attached the rims and the tires. The motor, shafts, pinions and racks are entirely enclosed in the assembled wheel. The motors are driven by current from a vehicle storage battery, or from a current for which energy is generated by a gasoline engine suitably installed in the vehicle.

The value of the device is not confined to vehicles alone, for it is claimed that it will give admirable results when utilized for innumerable purposes. The drive has been used practically for more than six years and a considerable number of the Couple-Gear service wagons are in use in different sections of the country.

NEW CARS AND SERVICE WAGONS.

Woolson to Build Two-Ton Wagon.

A two-ton service wagon is to be built by the Woolson Auto Truck Company, Riverton, N. J., of which concern C. T. Woolson is the principal owner.

Belmobile Makes Its Debut.

The Belmobile is a new popular-priced runabout to be placed in the market. It is built by the Bell Motor Car Company, Detroit, Mich., which concern is headed by W. D. Bell, who was for three years with the Peerless Motor Car Company, and H. R. Fordyce, well known to the Western motor car industry. The Belmobile has a four-cylinder engine with bore of 3.25 inches and stroke of 3.375 inches, and is rated at 20 horsepower. It is equipped with a Bosch high-tension magneto and with selective sliding gear speed change, giving two forward ratios and reverse. The clutch is multiple disc. The drive is by propeller shaft. The machine is sold fully equipped.

The Mooers Automobile Company has secured a factory at Trenton, N. J., and will immediately begin the manufacture of a six-cylinder pleasure car.

REORGANIZATION PLANS.

Excelsior Makes New Start.

The reorganization of the Excelsior Motor and Manufacturing Company, Chicago, Ill., which has capital of $500,000 has been accomplished. The original concern was the Excelsior Supply Company, and later the Excelsior Motor and Manufacturing Company was formed to manufacture motorcycles. The new concern takes over the business of the two.

New Men and New Factory for Empire.

The plans for the reorganization of the Empire Motor Car Company, Indianapolis, Ind., are making and it is is expected, with the withdrawal of Carl G. Fisher and James A. Allison, two of the founders of the concern, who desire to direct their activities elsewhere, that Cecil E. Gibson, one of Mr. Fisher's business associates, will be elected president, and that B. W. Twyman of Columbus, O., will be one of the principal stockholders and directors. As the Prest-O-Lite starter is now made in the Empire factory it is probable that a new plant will be secured.

Reorganizers Propose Electric Motorette.

Those concerned in the reorganization of the C. W. Kelsey Manufacturing Company, Hartford, Conn., have announced that the motorette model will be continued and that in addition an electric model will be produced. There will be a slight reduction of the price of the regular model, while the electric machine will be sold for about three times the cost of the gasoline vehicle.

WANTS PROCESSES WITH THE PATENTS.

Valveless Inner Tube Company Brings Peculiar Suit Against Parent Corporation.

THE Valveless Inner Tube Company has begun suit against the Sealomatics Syndicate, Ltd., of London, England, in the United States District Court for the Southern District of New York to secure an injunction preventing the defendant corporation disposing of the rights to certain processes, necessary in the manufacture of valveless tubes, to any person or company in the United States except the complaining corporation. It is claimed that the right to use these processes was purchased by the plaintiff.

The case involves the patent of William James Therold of London, who assigned his rights to the Sealomatics Parent Syndicate, and this concern later made agreement with George Wishart to exploit the tubes in the United States, it being provided in the contract that Wishart should have option on the United States patents that were to be applied for. These patents were issued.

Wishart then transferred his rights to the Valveless Inner Tube Company and preparations were made to manufacture the tubes at the works of the Walpole Rubber Company, Walpole, Mass. It was then learned that the tubes could not be produced without knowledge of the secret processes, which processes the English syndicate refuses to disclose. It was then believed that the Sealomatics Syndicate was negotiating with others for the sale of the secret processes, and the proceedings were instituted to enjoin the transfer of the necessary rights.

For Additional Trade Information See Pages 36, 37, 38, 39, 40.

INCREASES OF CAPITAL, MADE AND PROPOSED.

De Tamble Company Issues New Stock.

The De Tamble Motors Company, Anderson, Ind., has increased its capital to $200,000 and of this $101,000 has been acquired by James W. Sansberry and associates, and Mr. Sansberry has been given the general management of the business. He succeeded Charles H. Walters, who continues with the company as general superintendent.

Capitalization of Racine Company Doubled.

The capital of the Racine Manufacturing Company, Racine, Wis., has been increased from $400,000 to $800,000. The company claims to have the largest exclusive automobile body manufactory in the world. The president of the company is F. K. Bull, president of the J. I. Case Threshing Machine Company, and the secretary is J. W. Gilson, formerly assistant secretary and sales manager for the Mitchell-Lewis Motor Company. G. W. Jagers is treasurer and Harold Smith secretary of the organization.

Big Plans for Vacuum Oil Company.

The stockholders of the Vacuum Oil Company will meet in New York, N. Y., Feb. 29 to determine a proposal to increase the capital to $15,000,000 from $2,500,000, and to increase the number of directors from five to eight. The company has a bonded debt of $2,000,000 and a further debt of $8,000,000 due the Standard Oil Company of New Jersey, which is to be paid with the proceeds of the sale of stock, which is to be issued on a basis of five shares for each share now held by a stockholder. At the last annual statement made by the company, June 30, 1911, the assets of the company were $25,033,526, and the surplus was $11,429,034.

NEW PLANTS, BUILDING OR BUILT.

Has Steel Contract for Stevens-Duryea.

The American Bridge Company has contract with the Stevens-Duryea Company to deliver 4000 tons of structural steel, which is to be used in the construction of a new factory at East Springfield, Mass., early in April. The work is to be begun as early as weather conditions will permit.

King Company Gets Old Hupp Factory.

The present factory of the Hupp Motor Car Company, Jefferson and Concord avenues, Detroit, Mich., which was erected in 1909 and has about 70,000 square feet of floor space, is to pass into the possession of the King Motor Car Company when it is vacated by the Hupp company to occupy its new factory. The change will be made within the next two months.

MAINTAINS PATENTS ARE INVALID.

Standard Welding Company to Disregard License from United Rim Company

The Standard Welding Company, Cleveland, O., which has been making three types of automobile vehicle wheel rim under license from the United Rim Company, has discontinued the manufacture of two of these and will make the third, with the addition of some forms of its own creation, but will disregard the license formerly held for the rim that is to be made, maintaining the patents controlling it are invalid. The United Rim Company holds patents that represent a compromise of several large tire manufacturing companies with a view of standardizing quick detachable and demountable wheel rims, the organization being made to eliminate controversy and friction.

WILL BUY KNIGHT MOTORS ABROAD.

Edwards Company Not to Locate Until Executive Returns From Europe.

H. J. Edwards, who with C. G. Stoddard has organized the Edwards Motor Car Company, to engage in the manufacture of cars and service wagons, will sail in a few days for England to make the necessary arrangements for the Knight engines which are to be used in these machines. The location of the company has not been decided as yet, but it is probable that it will be in Indianapolis, Ind., where a considerable amount of stock has been subscribed with the understanding that the plant will be placed in that city. No location will be determined until the return of Mr. Edwards from England. The plans of the company so far as outlined include the production of either worm or bevel gear driven machines with Knight engines for the power plants. Offices have been established temporarily in the Knabe building, 439 Fifth avenue, New York, N. Y.

NEW CONCERNS IN THE INDUSTRY.

Will Make Forgings at Detroit.

With authorized capital of $100,000 the Automobile Forgings Company has been organized at Detroit, Mich., and established a factory at 33 Richmond street, that city. George W. Strelinger is president and G. W. Vandeveer vice president of the organization.

Fordham Heads Steinbock Company.

The Steinbock Engineering Company, which has been incorporated with capital of $1,000,000 under New Jersey law to engage in business at Peekskill, N. Y., has for president E. J. Fordham, H. E. Steinbock vice president, and F. B. Knowlton secretary-treasurer. The company is to manufacture pleasure cars.

Gas-Electric Trucks at Toronto.

Gaselectric Motors, Ltd., a corporation with capitalization of $1,000,000 has been organized at Toronto, with E. H. Thomas president, B. F. Honsinger vice president and H. S. Slate secretary and treasurer. The purpose of the company is to build vehicles which will be driven by motors fixed to the axles and with power generated by gasoline motors.

To Specialize Motor Truck Bodies.

The Motor Truck Body Company has been organized at Detroit, Mich., with Fred Proctor president, E. T. Hangstefer secretary and treasurer, and Harry A. Carie manufacturing manager, to manufacture bodies for power wagons. All incorporators were formerly engaged in the body department of the Packard Motor Car Company. The company has established its plant at 320-22 Franklin avenue.

Claims Valve Saves Carburetion.

The American Compensating Valve Company has been incorporated at Manitowoc, Wis., by Ludwig Stupecky, Stanley D. Eckells and Charles Zeman, with capital of $25,000, to manufacture a device invented by Stupecky and patented in the United States, Canada, Great Britain, Germany and France, which is installed in the carburetor in the place of the usual air valve. It is claimed that this eliminates the usual defects in carburetion.

New Truck to Be Built at Louisville.

The Transit truck is to be manufactured at Louisville, Ky., by the Transit Motor Truck Company, which has been organized with capital of $20,000 by W. B. Young, George H. Laib and E. G. Walker.

The three-story addition to the plant of the Chase Motor Truck Company, in Wyoming street, Syracuse, N. Y., is nearly ready for occupancy. It will considerably increase the facilities of the company.

For Additional Trade Information See Pages 36, 37, 38, 39, 40.

CORBIN COMPANY TO DISCONTINUE.

Abandons Manufacturing and Will Merely Produce Parts Needed for Cars in Use.

THE Corbin Motor Vehicle Corporation, New Britain, Conn., a subsidiary of the American Hardware Corporation, has disposed of all the cars it had manufactured to the Miner Garage Company, Hartford, Conn., and has discontinued the production of automobiles, although by the terms of the sale it will maintain its garage and repair shop at New Britain, and will either carry in stock or will produce whatever parts may be necessary for replacement or restoration during the five years ensuing from the date of the sale; perhaps for a longer period. So far as is known the company will exist during the period of the contract as now, for there has been no inclination to dispose of it, but the factory will be devoted to other lines of manufacture, as will the machine facilities, so far as this is possible.

The Corbin Motor Vehicle Corporation was organized about eight years since to manufacture a car with an air-cooled engine. After several years experience the first water-cooled machine was built and later on the larger, or the 40 horsepower vehicle, was produced. The head of the company, aside from one brief period, has been Maxwell S. Hart, and Guy Hutchinson has been during the same periods secretary and director of sales.

There is a belief that Messrs. Hart and Hutchinson will continue in the industry and may be directly concerned in the production of another car, for experiments have been made which seemingly establish foundation for such a conclusion.

WITH CORPORATIONS AND THEIR OFFICERS.

The Billings & Spencer Company.

The Billings & Spencer Company, Hartford, Conn., will hold its annual election Feb. 19. It is probable there will be no change of the officers.

Mulholland Is Chosen President.

Arthur E. Mulholland was chosen president, John Allen vice president and John T. Lombard treasurer of the Hastings Motor Shaft Company, Hastings, Mich., at the annual meeting of that concern.

Kuhner Company to Build Vehicles.

H. E. Kuhner is president, Alexis G. Pascault vice president, William B. Shannahan treasurer and George M. Wingard secretary, of the Kuhner Engine Company, Oxford, Md., which concern is to manufacture power wagons. The first products are planned to be a delivery wagon and a light truck for farm work.

Walsh Heads Newark Company.

The Newark Automobile Manufacturing Company, Newark, N. J., maker of the Newark truck, has elected these officers: John T. Walsh, president; John W. Philips, vice president; H. V. Radonitz, secretary-treasurer; Roland D. Crocker, counsel; John T. Walsh, John W. Philips, H. V. Radonitz, David King, Carl W. Johnson, W. B. Abbey, Roland C. Crocker, Chester A. Jones and Bela Cukor.

Humpage Succeeds Chalfant.

F. R. Humpage has succeeded to the presidency of the E. R. Thomas Motor Car Company, Buffalo, N. Y., from which E. P. Chalfant has retired to engage in business in New York. W. L. Gleason has been elected vice president of the company. There will be no other changes. J. J. Ramsey remains secretary and treasurer. Mr. Chalfant was executive of the Waltham Manufacturing Company when he was made general manager of the Association of Licensed Automobile Manufacturers, and he resigned that position to associate himself with the Packard Motor Car Company. Later, with Messrs. Gleason and Ramsey he went from the Packard company to the Thomas company.

BUSINESS TROUBLES AND LITIGATION.

Richmond Iron Works Bankrupt.

With assets claimed to be $111,351.90 and liabilities amounting to $67,577.96 the Richmond Iron Works Corporation, Richmond, Va., filed a voluntary petition in bankruptcy in the United States District Court at Richmond, which resulted in the appointment of M. H. D. Eichelberger as receiver. The company is said to own real estate valued at $75,000. The company built the Virginian car and failing to realize the success anticipated, it was decided to discontinue business.

Cameron Company in Receiver's Hands.

The affairs of the Cameron Motor Car Company, with main office and plant at Beverly, Mass., have been placed in the hands of a receiver as a result of bankruptcy proceedings instituted by some of its creditors. E. Howard Perley has charge of the company's business and it is probable that within a short time a statement of assets and liabilities will be made. The company made an offer of 10 per cent. to its creditors, which was not accepted and the proceedings were continued.

Breach of Contract Claimed.

The British Aluminum Company, Ltd., has instituted suit against the United States McAdamite Metal Company in the New York Supreme Court to recover $4368 with costs and interest, this being the amount claimed for an alleged breach of contract by the defendant. It is maintained that the contract involved the delivery of 100 tons of pure aluminum in ingots. at a price of 21 cents a pound, and after the delivery of 35 tons refused to order any of the 65 tons remaining contracted for. The plaintiff seeks to recover the difference between the market price of 17.5 cents a pound as of Dec. 31, 1911, and the 21 cents a pound as contracted for, for the 65 tons or metal not ordered.

FLANDERS ABSORBS UNIVERSAL.

The Flanders Manufacturing Company, Pontiac, Mich., which now operates an electric pleasure car and service wagon plant, a screw machine works, a motorcycle factory and a drop forge and a gear shop, is to absorb the Universal Motor Truck Company, Detroit, Mich., if plans now making are realised. The merger has been made with Howard T. Walton, who was head of the Universal Motor Car Company of New York, agent for the Universal trucks in the metropolis, as the principal, this following the purchase of the truck company by New York interests. A. O. Smith of Milwaukee, Wis., and George Uhlein of the same city are said to be heavily interested in the Flanders company.

WHOLESALE ONLY AT U. S. TIRE BRANCHES.

Products Will Be Distributed, but Not Sold at Retail by the Company.

The United States Tire Company, of which the Hartford, Continental, G & J and Morgan & Wright companies are constituents, has reorganized its method of distribution in that it will sell only at wholesale at its branch establishments, wherever these may be, and all retail sales are now made by dealers and other representatives. The adoption of this policy is to secure the co-operation of all distributors alike and to insure to them equality of profit upon the volume of business transacted. This eliminates any possibility of competition between the company and its agents.

For Additional Trade Information See Pages 36, 37, 38, 39, 40.

SYSTEMATIC GARAGE MANAGEMENT.

Practical Methods for Accounting for Stock and Time of Workmen, and Establishing the Relative Income, Expense and Profit for Each Department, Proposed for the Business Now Lacking Such Precise Detail Information.

THE systematic conduct of garage businesses is assuming greater importance with every owner or manager as the subject is given consideration. It is realized that it is necessary to economize time, material and labor and to establish such protection as is required to effectually prevent leakage or waste with a minimum of record. It is absolutely essential, however, to have accurate note to justify any determination. It is only possible to learn of progression through comparison and this establishes the need of references that will supply every fact.

A system suggested by H. D. Brunell, 320 Witherbee street, Flint, Mich., and which is in part supplied by him, is designed to be applied to an existing method of accounting and is conceived with a view of economizing stock and time in the repairing department, while he suggests a means of recording the receipts from and the cost of each car disposed of. This suggestion assumes that the garage is agent for one or more cars.

Mr. Brunell takes for granted the existence of certain necessary books for record, such as cash book, journal, general ledger, stock ledger, stock book, and the like, and also the conduct of the usual general accounts. He also presupposes an accounting of overhead expense, which he defines to include all nonproductive labor, rent, insurance, taxes, interest, incidentals, etc., to be kept under separate ledger accounts.

In his suggested record Mr. Brunell proposes that each form contain the detail essential for both instruction and accounting, using the fewest number of forms that is compatible with accuracy and completeness. Assuming that the business is repairing and selling cars, and that storage and the sale of accessories are not considered, he provides for recording the two former.

Considering the repairing he provides for a repair order that is made in triplicate, the original to go to the customer, if cash is paid for the work, the second to the office and the third to the repair envelope. By noting the accompanying form it will be seen that each order is given a serial number when entered and, if the work is on a car, the number of the motor is noted. Then is filled out the name of the customer, his address, the date, whether the work is to be a cash or charge transaction, and the make and model of the car. The blank also contains provision for entry where shipment of a motor, for instance, is made to the maker, this including the name and address of the consignee, the manner of shipment and the terms (whether the work is to be charged or paid for immediately), the model of the motor and the nature of the repair. There is a further record for the number of the cash sales sheet, if such be used, or the number of the invoice on which the charge is made. Below this is provision made for the detail of the repair, or the instruction.

The lower part of this blank is divided into halves, the right side of the sheet providing for charging the labor under the name or number of the workman by date and by hours, the left side providing for entry of the varying items of material requisitioned from stock or purchased and the amount charged for such parts or supplies.

The copy of the repair order is placed in a repair job envelope, which is of substantial paper, and on this is entered the job number, the name and address of the customer, the date, the number of the motor, the name of the car, the model of the car, with the general detail of instructions. This envelope is sent to the foreman and from this record is made by tagging the car or its components if disassembled. The envelope and this order are retained by the foreman.

In the course of the work on the job it is necessary to make requisition for stock and supplies. The workman makes application to the foreman, who fills out a requisition order blank which is given a serial number. On this is entered the number of pieces, the model of the car for which the stock is required, the name of the part or material and the price charged. Below this is entered the number of the job, the number of the motor of the car to be used on, the number of the cash sales sheet (if a cash transaction) or the name and address of the customer to whom the charge is to be made. This requisition is presented to the stock room and is honored, the articles being checked as delivered. This same requisition is used for all deliveries from stock, the repair order number being entered for a repair requisition, the purchaser's name and the cash sales sheet number if a cash sale, and the purchaser's name, to whom delivered and the invoice number if charged.

Labor Number or Name	Date	Hours	Material	

Repair Order—Should Be Made in Triplicate, Original to Go to Customer If the Transaction Is Cash, Copies to Office and to Repair Job Envelope.

The requisition, which is made in duplicate, is filled out by the foreman and checked in the stock room. It is then divided, one part going back to the foreman and the other part is retained in the stock room as a voucher. The requisition copy is returned to the foreman and is placed in the envelope of the job with the repair order.

The workmen, whose time is recorded when they report for or leave their work, are required to keep their time for each job on which they are engaged. That this may be done systematically the time is noted on cards. On these cards are entered the name and number of the mechanic, the job number, motor number, date, the nature of the repair, and the number of hours engaged. These cards are small and are printed in series with perforation for convenient separation, the last ticket giving the name and number of the workman, the date and the total hours. The workmen are required to charge their time to the job number as soon as it is completed. The time card or cards of the workers engaged on the job are placed in the repair order envelope, and the time keeper receives the ticket that accounts for the total time of each man.

Repair Envelope—Should Contain Repair Order, Copies of Stock Requisitions and Workmen's Time Tickets, the Whole to Be Filed on Completion of Work in Numerical Order.

When the character of the job necessitates a shipment of a part for repair or special work this is noted in the repair order by the foreman and the outside charge for this special work is entered in the order and later charged with the other items. The condition of the repair order indicates whether or not the outside work has been completed.

Assuming that the job has been completed the repair order envelope, with its repair order, requisitions and time cards, is returned to the office. From this copy of the repair order blank the other two copies are filled out. The one is kept with the requisitions and time cards in the repair order envelope, these envelopes being filed in numerical order for reference. The original is for the customer and is given to him as a voucher if the transaction is cash. If the bill is charged the original may be made a part of the transaction for a stated period, as for a month, while the other copy may be filed in a loose leaf binder or ledger and carried in this form as an account. If the relations are constant it is probable that there is a ledger account and the entries may be made as is customary.

Where the work is for the management it is essential that the labor and the stock or material be charged to an account covering a particular expense or expenses. For instance, should the job be an adjustment on a car sold, this would be charged to the car account and against the revenue from this particular machine. Every other item ought to be similarly noted and this will account for the time of every worker and the parts and supplies.

Requisition for Stock.

No. ....

No. Pcs.	Model	Name of part	Price	

For Job No. .... Motor No. ....

For ....

Cash Sheet No. ....

Charge to ....Inv. No. ...

Stock Requisition—If Parts Are Drawn from Stock for Use on Repair Order Enter Number of Repair Order; If for Cash Sale Enter Cash Sheet Number and Name of Purchaser; If to Be Charged Enter Purchaser's Name, to Whom Charged and Invoice Number.

For the stock room a receiving sheet is provided that is given a serial number and on this sheet is entered every article of stock that is received. This sheet indicates from whom the stock was received, the number of pieces, the model, the part number and the name of the part or material. From this the entries are checked in the stock ledger. Against the record all the parts supplied for requisitions are charged, the difference indicating the condition of the stock whenever comparison is desired.

The cash sale sheet is given a serial number and is dated. This carries the entry of the repair order number, the stock requisition number, the name of the customer, the name of the car and the amount. This is made in duplicate and it gives detail that cannot be usually found in the cash book.

Workman's Time Card—Print as Many Tickets, with Perforation for Separation, to a Card as Is Desirable. Last Ticket of Card to Go to Time Keeper.

Whether but one or several makes of cars be sold it is believed that the record of each individual car received is essential. Besides it is necessary to provide for certain transactions which do not represent actual transfers of money but must be regarded as having established value. This means that under the name of each make of car ledger accounts should be opened to car sales, parts sales, parts, and replacements and gratis repairs. Each account must be separate and distinct and show the number of cars received, the charges against each car, the price each car is sold for and the credits that reduce the revenue from each vehicle.

Mr. Burnell proposes a form of record that will average the profit or loss on the total number of cars sold during a given time rather than applying to each car, but comments that while the actual loss or gain on each car will not be indicated the data will be decidedly interesting. He points out that the car sales account, less the replacement account and plus the overhead charge will show the profit or loss on cars alone.

He suggests that a record sheet be made out that will be utilized for each car. This will have note of the name of the car, the model, the motor number, the date received, the date delivered to customer, the terms, the customer's name and address. This sheet is to be divided longitudinally and at the right side the general heading "Credit," and the general heading "Debit" at the left. Under these headings are divisions, the first "Debit" group including "Manufacturer's Price," "Freight" and "Extra Equipment;" the second group "Overhead" and "Parts Replacements;" the third "Repair Work (Gratis)," and under this "Job No.," "Labor" and "Material." Each group has abundant blank lines for additional entries.

Stock Room Receiving Sheet.

Stock Room Receiving Sheet—Check from This to the Stock Ledger. All Parts Sent from Stock to Be Checked from Stock Requisitions.

Opposite the first "Debit" group, under the "Credit" head, is space for entry of "Allowance by Manufacturer" items; opposite the second group is similar provision for "Allowed or Replaced by Manufacturer" entries, and opposite the third group may be entered "Allowances or Replacements by Manufacturer" which relate to repair work. It is pointed out that in making entries in this sheet the parts replacements "Debit" group may show but the requisition or invoice number, at total amount allowed, or the actual part replaced with the amount of allowance. Credited to the second and third groups are the manufacturer's credit memo number and the amount allowed.

Individual Car Record—Have Sufficient Space for Entries for Each Group and for Time Record. Parts Replacement Column May Show But the Requisition Invoice Number, the Total Amount Allowed, or the Actual Part Replaced with the Amount Allowed. The Credit Will Show the Manufacturers' Credit Memoranda Number and the Amount Allowed to Both Parts Replacements and Repair Work.

In charging overhead expense Mr. Burnell states that the total may be divided among the different cars or charged on the individual car record with reference to the number of cars handled for the month or the year. This would give an average revenue for a given period and it would not afford the precise information that would be possible were a separate account opened with each, but it would eliminate considerable itemized record. The precise value of the car record is in its accuracy and through this making it possible to effectually prevent the minor leaks. The large sources for shrinkage are generally well enough known and can be provided for to a greater or less extent, but it is with those which singly are trifling and collectively considerable that any system is created to cope.

Overhead expense is so differently regarded by different business men that it is necessary that it should be closely analyzed to include every charge that may be fixed. There are charges that are exceedingly variable, such as advertising, heating, lighting, water, repairs, etc., which must be averaged annually and apportioned with reference to each month on the basis of the corresponding month of the previous year, or estimated for the year and charged according to the estimate with a reserve or provision for emergency or extraordinary expense. The record of the dealings with the manufacturer and the customer relative to each car means that record must be continued after the sale of the machine has been consummated and indicates the actual profit on the service given in connection with each car so long as its owner desires to do business with the agent. This, however, is hardly a policy that can be approved, for work on the car ought to be regarded as repairing unless it comes within the guarantee of the manufacturer, for which attention the manufacturer ought to make reasonable allowance.

Cash Sale Sheet.

No. ....

Date ...., 1912

Repair Order No	Stock Requisition No.	Name	Amount	Name of Car

Cash Sales Sheet—The Data of This Sheet Will Be Charged to Stock and Credited to Car Account to Which It Relates.

The completeness of the repair department record cannot be too strongly advocated, as the possibility for loss through lost time and waste of material and supplies is much larger than is generally believed. In the accounting for time of the men the foreman or time keeper has a responsibility, while in the matter of stock and supplies this accountability ought to be placed entirely upon the stock keeper whose record must of necessity be thorough.

The accompanying forms, which have been suggested by Mr. Burnell, are in the main self explanatory. They may be adapted to the service of many garages, no matter what the proportions, and appear to be well suited to small establishments where the keeping of the records are combined with other duties. These may be modified to meet with requirements and among other advantages have the quality of adaptation without special preparation other than making inventory of the stock. In the matter of the individual car record and figuring overhead expense this would necessitate an accounting of the business for a reasonable period.

YOUR EXPERIENCE WITH YOUR BUSINESS.

What Will Yield Greatest Economy and Perfect Garage Service?

In our business of selling automobiles for the past six years we have always conducted a combination of selling, garaging and repairing. The only direct route to the profit account in the general automobile business is through selling a good car, having a good general at the head of the organization, and giving him able assistance and co-operation. Without these the foundation will be weak, and without a good foundation a business cannot prosper.

Our business was first conducted in a one-story structure, 60x125 feet, and we now occupy a three-story reinforced concrete building having 26,000 square feet floor space. The original working force varied from six to eight men, while today we have 34 on the pay roll. Where we originally stored six cars we have increased this service until we now have about 75 cars in storage. We only garage and repair cars which we sell, believing it is good business policy and a strong selling point to have only cars that we sell on display in the garage and to keep our cars in good repair. In other words we believe in giving the best of service to our customers and that we sell more cars, although the repair department shows a loss in itself, this loss being regarded as really a profit when its influence on the selling department is considered.

The employees who have been in our service for a year participate in the net profits, which policy makes it possible for us to attract and to retain the services of good men. We render detailed bills to the customers at the end of each month and all complaints are taken up and adjusted promptly. We find it best not to draw a line too closely where adjustments are necessary, and in many cases give the customer the benefit rather than have him displeased. It is wise not to establish a set rule in dealing with customers, but each should be dealt with individually, for a statement that might be as pleasing as sugar to the one man might be as vinegar to another.

We carry a very complete stock of parts for all our different models, but do not sell supplies save in a limited way, prices being cut on these to a surprising extent. Rather than meet these cut prices we prefer that this business should be done by others. When a customer comes to us and states that he can purchase certain articles at values less than we establish for them we tell him frankly that we would like to have his order, but under the circumstances we would prefer to have him buy where he can procure what he needs the cheapest. You will finally reap your reward, if not in furnishing the customer his supplies, at least in selling him and his friends more cars.

A. J. ZIMMERMAN.

St. Louis, Mo., Jan. 29, 1912.

The Minerva Motors Company, Antwerp, Belgium, is represented in the United States by F. W. Sewell, who has salesrooms at 1964 Broadway, New York City.

What Classes and Combinations of Cars Should a Dealer Sell?

I am decidedly of the opinion that it is best to handle more than one make of cars for several good reasons. This conclusion is reached after observation of examples of one-car agencies and those handling more than that number for a considerable period. I have no doubt that a number of the readers of this article will agree with me.

I know personally the experience of an agent who handled but one make of car who had the bad luck if you term it such, to be unable to secure cars from the manufacturer (I think a change was made in the construction to rectify a blunder in design) until very late in the season. Delivery was delayed so long that he was compelled to cancel many of his orders. This was his first season in business and as his capital was limited he was so discouraged that he retired and abandoned the agency.

I also personally know of another agent who handled several makes of cars. During one season his customers had so much trouble with one particular machine that he practically lost all his business with this line. Had he depended wholly on this agency he would have lost a great deal of money that season. Assuming that a man has the agency for a single car and the factory is destroyed by fire, as an illustration, when the demand for cars is at its height, he is deprived of his business for a time, at least, and perhaps badly crippled. Again, but not least, should an agent develop a profitable business with a car and the manufacturer decide to open a branch, this would practically deprive him of what he could justly regard as his possession.

My experience is that it is safest and most remunerative to have at least two agencies, the one for a car ranging in price from $850 to $1600 on one line, and the other for a car selling from $2000 to $4000. With these neither would conflict with the other. Should you have a bad season with one you would probably be able to show a profit with the other. With this plan you would be able to supply a car for a very broad class of trade. It might be possible to sell a low priced car to one man for business purposes, and a higher priced machine to the same man for family use. Expressed in the parlance of the street you would "get 'em going and coming." In the event that one of the lines did not come up to expectations it would be possible to abandon it and devote one's endeavors entirely to the profitable car until it was possible to replace the weak agency. In connection with this the proportion of selling and garage expense would not be as great with two lines as with one, and a good salesman would be as able to sell two classes of machines as but one.

The United States Light and Heating Company has established a branch at 5 Irvington street, Boston, Mass.

MAGNETOS FOR GAS ENGINE SERVICE.*

Principles Involved in the Design of Standard Instruments, Features of Construction and Conditions Essential to Efficient and Continued Operation of This Generally Adopted Source of Electric Energy.

(Continued from January Issue.)

THE Eisemann magneto group has been used with very complete battery systems, one of these being shown at Fig. 14 as applied to model 19 Peerless cars. These systems are separate and independent of each other, the battery group consisting of a four-unit coil, timer, source of current and set of spark plugs. The magneto system includes the generator, switch, transformer coil and set of spark plugs. The wiring arrangement is clearly shown in the diagram, but as this is a representative system, it will be well to explain the functions of the various parts and follow the circuits of both battery and magneto groups.

How Battery Ignition System Is Wired.

Following the circuits from the battery box with the aid of the diagram, we find one wire of cable connected to the battery post (painted red). This wire is carried to the coil where it is attached to the coil box terminal marked +. From M the terminal on the coil, a negative wire is attached to some part of the engine (as indicated at the point M). A return negative wire is fastened to the negative post of the battery (painted black) and leads to the post on the commutator shaft being doubly grounded on brass plate on cylinder 2. This forms a ground and completes the battery circuit for voltmeter.

The terminals on the coil box are connected through the switch to the four primary or low-tension windings of the four coils, which connect in turn through the upper terminals marked C1, C2, C3, C4, with each of the four brass terminal sleeves that are slotted |, ||, ||||, ||| to correspond with the upright terminal posts marked 1, 2, 4, 3 on the fibre base of the commutator. These four posts are connected with four copper contact segments that form a circular disc over which travels the contact brush that is connected through the upright shaft with a spring brush on the side of the commutator column, and also to the common ground wire on the side of cylinder 2. Two duplex cables are used in connecting the commutator to primary circuit of the coil.

Heavy insulated wire is used in the secondary circuit wiring from posts on the coil box marked B1, B2, B3, B4 to the rear end of the manifold wire bar (described later) terminals marked C1, C2, C3, C4. Thence from the wire bar through terminals marked C1, C2, C3, C4 to the spark plugs of the engine. The manifold wire bar is a solid rubber bar in which are encased the wires used for the transmission of the high-tension current used in both systems of ignition. This bar is plainly marked C for battery system and M for magneto system. This makes easy tracing of the current from the spark plugs of each cylinder through the entire system by means of the corresponding letter and number on the manifold bar.

The battery system is in circuit when the switch, located on the coil box, is thrown to the extreme left and the switch plug is in place, and is not in circuit when lever is thrown to the right. In the spark coil the making and breaking of the primary current by means of the vibrating tremblers at the top of each coil, sets up in the secondary coil, surrounding each primary coil, a highly intensified induced current. This secondary high-tension current flows from the four secondary terminals at the bottom of the spark coil marked B1, B2, B3, B4, to the spark plugs in each cylinder, where the current jumps the gap at the spark plug, creating a spark in the cylinder that ignites the successive charges of gas.

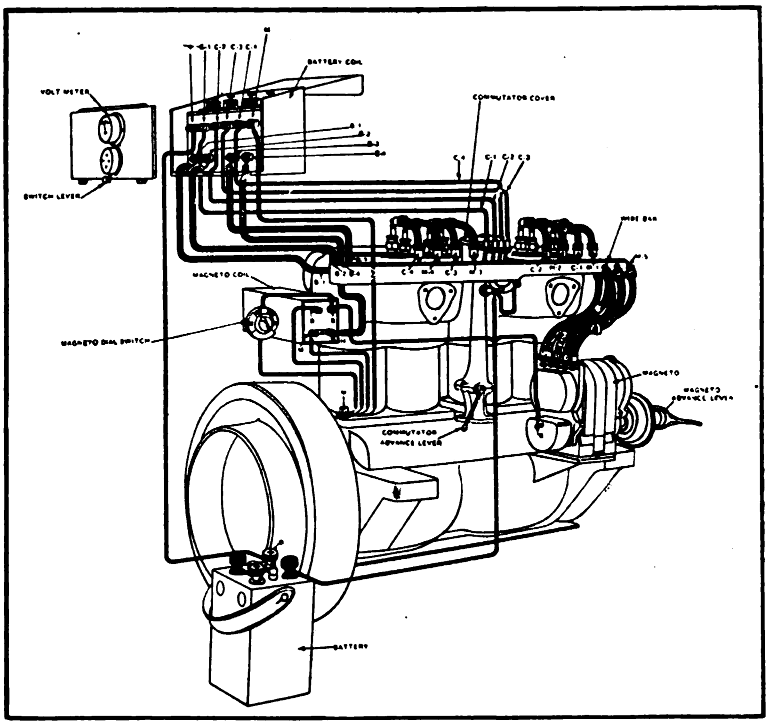

Fig. 14—Eisemann Magneto Group Main Element of Typical Double System.

One end of the secondary circuit is connected to the spark plug terminal, and the other to the primary wire which completes the circuit to the ground. This is common with the outer threaded shell of the plug when it is screwed into the cylinder. The time of the explosion in each cylinder is controlled by the time of contact of the revolving commutator brush with each of the copper commutator segments, which are connected through the agency of the posts 1, 2, 4, 3 and the wires with their respective cylinders.

Wiring of Magneto System Simple.

The primary wiring for the magneto system starts from the post marked B on the magneto and goes to the magneto coil terminal marked B on the right hand side of the magneto coil. From B (right hand) on the coil, a wire is run through the magneto dial switch to the common ground M. Wire from B (left hand side of magneto coil) to ground M. Wire from M on magneto coil to ground M. Wire from H to manifold wire bar (rear end) terminal marked 5 which is the high-tension distributing wire for the magneto.

---

*This article, which is descriptive of a number of the best known magnetos to be found in the market, and which are standard with motorists, is reproduced from the "A B C of Magneto Ignition Systems," one of the series of Standard Handbooks of Automobile Mechanics published by The Automobile Journal Publishing Company. It will be continued through several numbers.

The secondary circuit for the magneto system consists of four heavy insulated wires with hard rubber terminals, connecting corresponding numbers on the magneto board to magneto numbers on the front end of the manifold wire bar. Also one wire 5 from magneto coil to 5 on magneto board through terminal marked 5 at front end of manifold bar. This secondary circuit of the magneto is carried to the spark plugs through the wire bar terminals M1, M2, M3, M4.

The magneto dial is located on the dash just to the left of the coil box within easy reach of the operator. This dial is marked A and M. When the indicator is placed on A there is a direct short circuit which causes the flow of current from the magneto to the frame of the car, thereby creating no secondary current to the spark plugs. When placed on M the circuit is open so that the current goes to the spark plugs after being transformed to a high-tension current in the magneto coil.

Features of Connecticut Magneto.

The Connecticut magneto is one that operates on the transformer coil system but is really a compromise type, designed by the maker to incorporate the advantages of both systems as much as possible. The details of construction are outlined at Fig. 15, and the design is simple and easily understood. In the low-tension instruments previously considered, the transformer coil has been a separate fixture, designed to be mounted on the dash or other part of the car, which involves the use of wires to provide for the passage of electricity from the magneto to the coil; these conductors are liable to deteriorate, especially if carelessly installed, and the consequent leakage of energy may reduce the efficiency of the instrument.

One of the arguments advanced by those favoring direct high-tension magnetos is that the wiring is simplified, all the necessary connections being made inside the device, only five wires being needed to connect a high-tension magneto to a four-cylinder engine. Of these four secondary leads run directly from the distributor to the plugs, the remaining wire including a switch in circuit by which the armature current may be grounded to stop the motor.

It will be apparent that the method of housing the transformer coil in the space between the magneto pole pieces or base assembly and the magnets utilizes space that is often lost, and makes it possible to have all primary and secondary connections in the instrument itself, except those leading to the switch or plugs, as in the high-tension form. The transformer coil is encased in a metal tube which is threaded in place, and as it is protected from injury or moisture, it is as much a part of the magneto as though wound on the armature.

In general construction, the Connecticut magneto follows conventional practise, inasmuch as the single wound armature revolves between the pole pieces energized by the permanent U magnets forming the field. The design permits of several refinements in construction, however, such as the simple connection between the revolving distributing brush and the secondary terminal of the coil. It will be seen that there is very little opportunity for loss of current in the conductor between the coil and distributor when this method of installing the transformer prevails.

Wiring Connecticut Dual System.

The Connecticut magneto may be used independently or in connection with a double system, and two types of instruments are made. The single form is intended for use with one set of plugs, and is a complete ignition system in itself; or it can be employed with a double system in which a battery and coil outfit furnishes current to an auxiliary set of plugs, forming a distinct unit. The dual type magneto combines two ignition devices in one, battery and magneto, using but one group of plugs.

The method of connecting the various parts is clearly shown in diagram Fig. 16. The advantage of this type is that the same magneto transformer coil is used to produce the spark, whether from the starting vibrator, the battery or the magneto. The same interruptor and distributor are used for the battery or magneto systems, and the only change in switching from the battery to magneto consists in the substitution of the electrical energy produced in the armature for that resulting from the dry cells.

The vibrator is resorted to only for the starting spark and it is so wired that it is only in operation when the starting button on the switch is pressed. After the button is released, ignition takes place from the battery, single sparks being supplied the plugs until the switch lever is moved to magneto position, at which time the battery is out of the circuit.

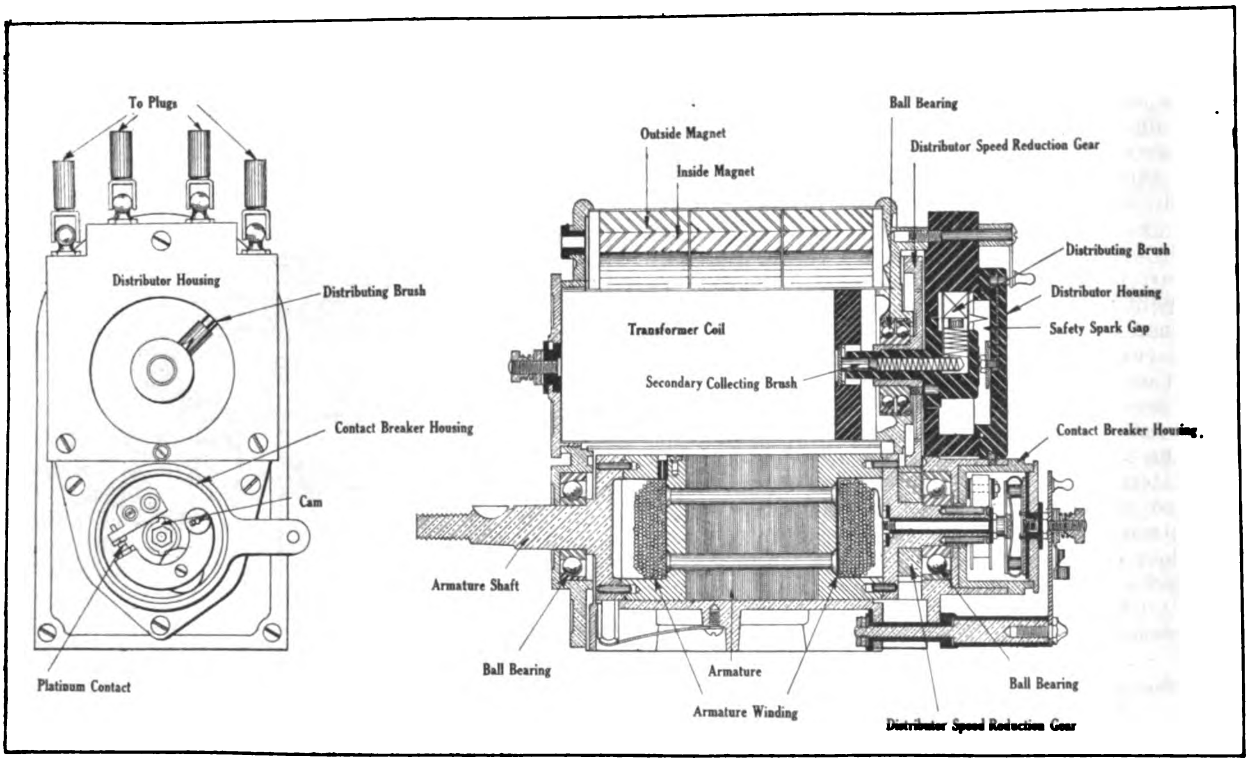

Fig. 15—End View and Longitudinal Section of Connecticut Magneto Clearly Depicts Excellence of Design.

The operation is as follows: The running or key plug, without which either system is inoperative, is inserted in the switch and the switch lever moved to battery position. The engine is now ready to start either by cranking in the usual way or on the spark by momentarily pressing the starting button in the centre of the switch. When the button is depressed the vibrator and primary of the transformer coil are coupled in series in such manner that the battery circuit is automatically made and broken many times during this depression, and a constant series of impulses is produced in the secondary coil of the transformer because of the fluctuations in core strength of the primary. This steady stream of high-tension sparks is supplied to the cylinder about to fire by the distributing brush of the magneto distributor, which is in contact with one of the segments leading to the plugs. These sparks are more powerful than the single one usually obtained from the plain coil, and ignition of the poorest mixture is assured. As soon as the engine starts the button is released, the battery current being interrupted by the magneto contact breaker and single sparks taking place in the cylinders.

How Vibrator Is Operated.

This may be better understood by referring to the diagram and tracing the wiring. The starting vibrator is a simple device that operates the same as the usual fitting of this character commonly installed on battery coils, except that the oscillating member or armature, as it is called, is actuated by a separate electro-magnet instead of by the magnetic flux of the transformer coil core, as is possible when it is mounted on the coil box.

We will assume that the switch lever has been placed on the battery position, that is, swung over to the right so that the movable switch contact is making a connection with the fixed point B, to which the negative pole N of the battery is connected by a wire. The spring in the switch operated by the push button is marked X and is normally in contact with the point Y of the switch. If the push button is depressed, the contact spring X makes contact with the point Z coupled to the insulated platinum tipped vibrator screw V. The contact points of the vibrator are normally in contact so that current can flow from V to W and thence to the ground, by passing around the winding and making a magnet of the core of the vibrator winding. From the ground, the current enters the primary coil through P 1, passes through it and energizes the core, at the same time producing a secondary or high-tension current in the secondary winding, and leaves the primary winding at P 2. This terminal is connected to the switch contact C, and the current passes to the switch plug, thence to the swinging lever of the switch which is in contact with fixed point B and back to the battery terminal N. The current leaves the battery from the carbon terminal or positive pole P and flows to the fixed switch terminal A, which in turn is connected with the button operated spring X.

Vibrator in Circuit with Primary Coil.

It will be evident that just as soon as the button is depressed and connection made between X and Z the vibrator winding is coupled in series with that of the transformer coil. This remains in circuit until the magnetism of the vibrator core pulls the armature W from contact with platinum tipped screw V, thus interrupting the current flow through the circuit represented by the wire leading from battery terminal P to switch terminal A, the spring X, the wire leading from Z to vibrator screw V, the winding of the vibrator, the ground to terminal P 1, the primary winding of the transformer coil, the wire leading from P 2 to switch terminal C, the short wire connecting the switch plug and switch lever, this lever itself, which is now supposed to be in contact with B, and the wire leading from B to battery terminal N. With each interruption of this circuit, there is an impulse in the secondary.

As soon as the circuit described above is interrupted by the separation of the vibrator points, assuming that the starting button is still depressed, the core in the vibrator winding loses its magnetism and the armature W is released again and again re-establishes the circuit, once more energizing the core causing another separation of the contact points V and W. The circuit is thus established and interrupted many times each second, and as there is a secondary impulse for each interruption it will be evident there is a constant succession of sparks at the plug as long as the starting button makes the contact between points X and Z of the switch.

How Battery Current Flows.

When the button is released, the spring X again makes contact with point Y and the vibrator is out of the circuit. The current flow is then through the wire leading from battery terminal P to A on switch, through spring X to contact Y and terminal D, from which a wire leads to the insulated contact breaker platinum tipped screw E. If the points are in contact, the current flows to contact lever F and from thence to the ground. From the ground the electricity passes to the transformer primary coil at connection P 1, thence through the primary winding to P 2. The remainder of the circuit to the battery is the same as when the starting button is depressed. When the contact breaker points separate, an impulse is produced in the transformer high-tension winding by induction and is commutated to the plug in the cylinder about to fire by the distributor brush. Only a single spark takes place, however, but this is so energetic there is no possibility of the charge failing to ignite.

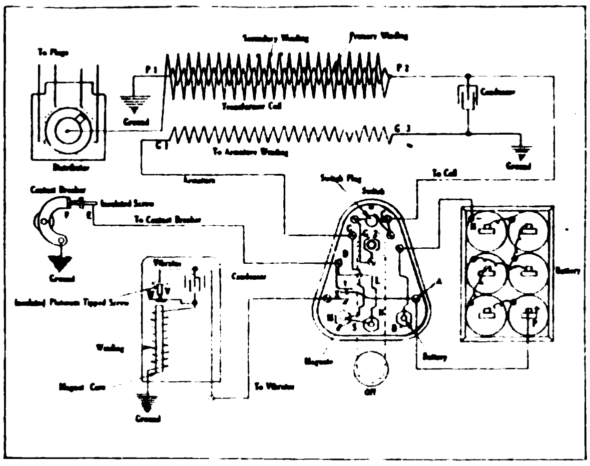

Fig. 16—Wiring Diagram, Connecticut Dual System.

Tracing the Magneto Armature Circuit.

When the switch lever is thrown to the left so it is in contact with fixed terminal M, the current produced in the magneto armature winding is utilized only when the contact breaker points separate. When these are together, any current existing in the armature winding is grounded directly through the switch and contact breaker. If the points are together, the circuit is represented by the wire leading from G 1, this corresponding to the insulated winding end to the terminal G in the switch, from thence to M, over the short conductor S (which bridges the terminals M and N only when the switch lever is in magneto position) to N, through the conductor L to terminal D, over the wire connecting D to E and to the ground by the lever F. From the ground to connection G 3. As no current flows through the primary of the induction coil, taking the shorter path through the closed contact breaker circuit by preference, there is no impulse in the secondary and no spark in the cylinder. Let us assume that the points are separated. The current in the armature, which reaches its greatest intensity when the points are apart is forced to take a longer path. This circuit may be traced as follows:

From insulated armature winding terminal G 1 to G in switch, over the wire joining G and M, from thence over the switch lever to G 2, to G through the switch plug, to primary coil terminal P 2, through the winding to P 1 and from thence to ground and over the ground to G 3. As soon as the contact breaker points make contact again (their circuit is interrupted only for a moment), the current from the magneto armature is again shortened and follows the shorter path that does not include the transformer coil winding. When the current flow through the transformer coil primary winding ceases, an impulse is produced in the secondary, an impulse also occurring as soon as the contact breaker points separate and the core is energized. It will be evident that every time the contact breaker points separate a spark will be produced in one of the cylinders, depending upon the position of the distributor brush.

Pfanstiehl Magneto Has Self-Contained Coil.

The arrangement of the parts of the Pfanstiehl magneto is clearly shown at Fig. 17. This is the type B for 1911, and delivers a high-tension current, is connected, this current leaving the magneto through the terminal B. The other end of the primary winding of the induction coil and a condenser terminal are brought together at A, and from there go to an insulated terminal on the magneto, being connected to B through the switch, so that the circuit can be intermittently grounded by the closing of the contact points on the cam operated rocker arm and insulated contact screw. The free end of the secondary winding of the transformer is brought to the secondary collecting brush, from which a short wire conveys the energy to the revolving distributing brush that contacts with the fixed segments in connection with the spark plugs in the engine cylinders.

The front elevation of the magneto is shown as well as the longitudinal section, in order to make clear the detail of the magneto contact breaker and the method of distributing the high-tension current through the distributor. Elevation shows cover F of the distributing chamber and plate G closing the contact breaker housing removed, these being held in position by the spring H, as outlined in the sketch.

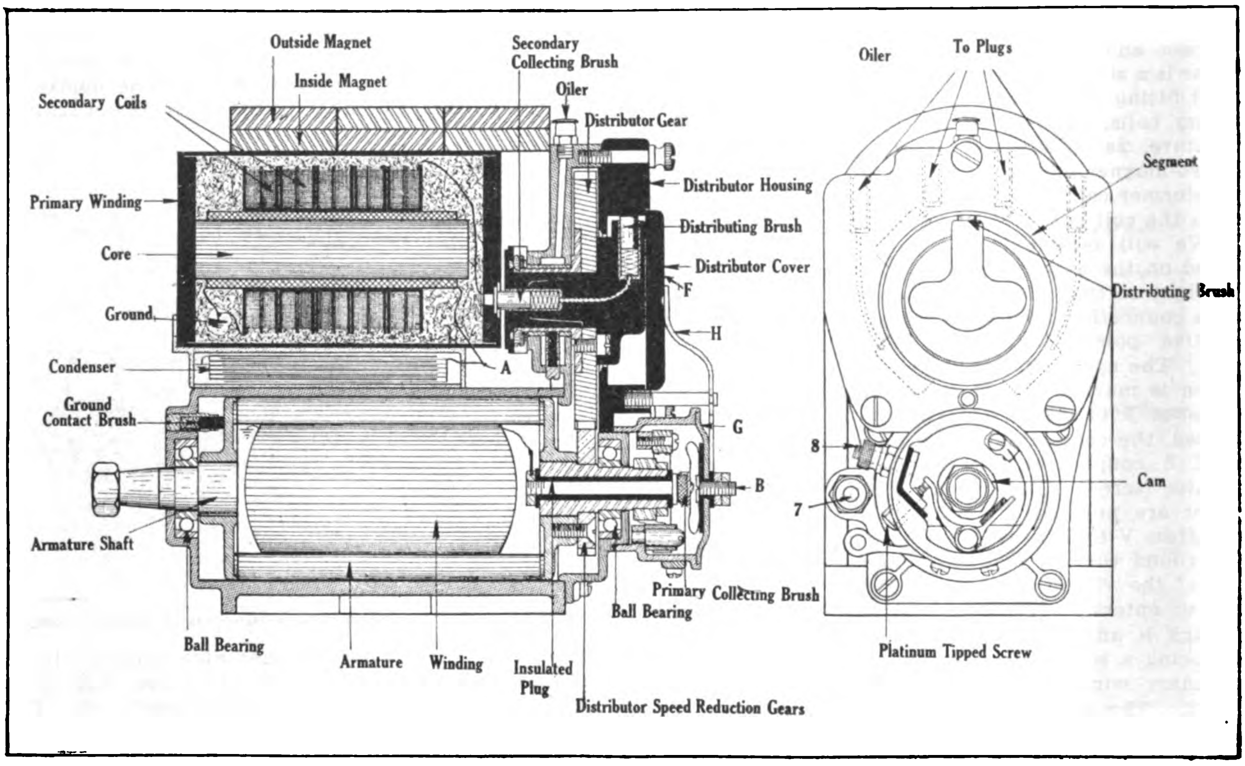

Fig. 17—Arrangement of Parts of Pfanstiehl Magneto with Self-Contained Transformer Coil.

though the secondary winding, in which the low voltage is "stepped up," is mounted in the transformer coil. This is placed under the arch of the magnets instead of on the dash or on the armature, and in this respect the design is similar to that of the instrument previously described. The grouping of the parts is easily followed, as these are plainly indicated in sketch.

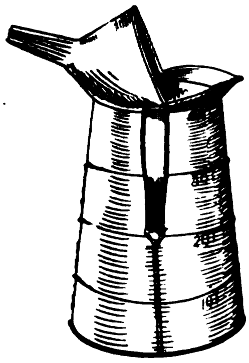
Referring to the longitudinal section, it will be evident that the magnetic field in which the armature revolves is produced by three pairs of U magnets, as in most conventional designs. The armature is an ordinary H or shuttle type and has a single winding of comparatively coarse wire, producing a current having considerable amperage but low voltage, and revolves on annular ball bearings. One end of the armature winding, one terminal of the condenser, one of the ends of the transformer coil primary, and one of the ends of the transformer secondary winding are grounded. The other end of the armature winding is attached to the insulated plug at the contact breaker end of the armature shaft to which the primary collecting brush in the contact breaker cover

The construction of the transformer coil used to "step up" the current of low voltage can be learned from longitudinal section. This consists of a core composed of a bundle of soft iron wire around which is wound a primary of coarse wire, usually about No. 16 or 18 standard wire gauge. The secondary winding is of finer wire, this varying from No. 36 to 40. In the Pfanstiehl transformer the secondary is a number of thin coils, each being separately insulated by being wound on its own bobbin or spool of insulating material. This construction makes for better insulation and reduces the liability of breakdown in the windings, such as sometimes occurs in transformers having a continuous winding. This assembly is placed in its containing case of insulating material and is surrounded by hard composition, which has been poured in while fluid so that every interstice in the windings is properly saturated. Obviously, the parts will be held firmly together when the material has become set.

(To Be Continued.)

ACCESSORIES AND APPLIANCES THAT SELL.

The Dover Duplex Funnel is a new addition to the line produced by the Dover Stamping & Manufacturing Company, Cambridge, Mass. It is a combination measure and funnel and is fitted with a pouring lip with a centre channel, an appreciable feature when fast pouring is desired. For filling oilers or vessels having small openings a funnel is provided on the opposite side and the spout extends upward so that when the measure is set down the oil runs back into it instead of dripping outside. The handle is located on the side, facilitating work when the device is being operated in close quarters or cramped places. In addition the measure is graduated, each being marked, and these comprise pints and quarts. The line is manufactured of extra heavy material, copper plated, lacquered, and all seams are soldered and guaranteed not to leak. They are made in sizes ranging from one-half pint to four quarts capacity.



Dover Duplex Measure

The Stromberg Dash Adjustment is the product of the Stromberg Motor Devices Company, Chicago, maker of the well known carburetor of that name, and is designed to be utilized in connection with the vaporizer. To obtain the best results from a carburetor the mixture should be perfect, and although adjustment may be made with the motor running idle, it is more advantageous to set the device when the engine is working under ordinary conditions. This usually requires two men, one to operate the car while the other adjusts the carburetor. The Stromberg appliance, which is made in several forms, is attached to the dash and is equipped with a plunger rod which extends to the vaporizer. By turning a knurled member the mixture may be varied throughout, an appreciable feature where atmospheric and other conditions prevail.

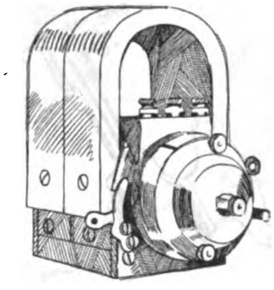
The No-Lag Magneto, manufactured and marketed by the American Circular Loom Company, Aldene, Union County, N. J., is of the low-tension type and two alternating waves of current are generated in the armature at each revolution. One of these waves is interrupted by one pair of contact points of the circuit breaker, and the other by another similar pair of points located directly opposite on the other side. The low-tension current is built up by two transformers, compactly arranged, by which it is claimed that the efficiency is increased greatly, and that the spark occurs in the cylinder at the same instant that the break takes place at the contact points of the circuit breaker. It is also claimed that wear is reduced and that by placing the condensers directly over and very near the circuit breaker, burning and pitting of the platinum points is eliminated. Instead of distributing a high-tension current to each plug and returning through a ground, two spark plugs are placed in a series circuit, producing a spark in two cylinders, timed to take place, in one, at the end of the compression stroke, and in the other, at the end of the exhaust. The spark in the latter cleans the points of the plug and intensifies the spark in the cylinder on compression.



No-Lag Magneto

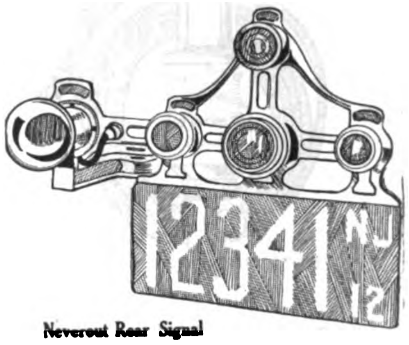
The Neverout Rear Signal Bracket is a combined rear lamp, license bracket and signalling device produced and marketed by the Rose Manufacturing Company, Philadelphia, it being patented in this country and abroad. It is operated by electricity and a push button switch is placed in an accessible position. This is equipped with three buttons for lighting the desired signalling lamps. The latter are four in number. A red disc is fitted to the middle of the bracket, this light burning constantly during the night and serving as the usual tail light. This is provided with a slot which allows a white light to be thrown upon the number plate attached immediately below. On either side of the red lamp is a white disc, these being employed for signalling to a vehicle in the rear that the operator of the machine in front is about to turn to the right or left as the case may be. Above the tail light disc is a similar member which shows a green light, this being utilized to warn those in the rear that the automobile is about to be stopped. Attached to the device is an electric horn which is sounded each time the white or green lights are operated, or flashed. The buttons on the switch are so arranged that a mistake cannot be made in signalling as the right hand member operates one white light at the rear, the left button the other, and the centre, the green.



Neverout Rear Signal

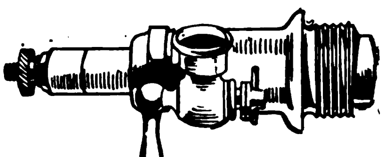
All-In-One Spark Plugs, marketed by the Frontier Specialty Company, Buffalo, N. Y., are manfactured in six different types to meet the requirements of varying motor designs. The construction eliminates the removal of a spark plug for priming purposes as a priming cup is incorporated, a feature which will interest motorists whose engines are not fitted with such a component.



All-in-One Spark Plug

The Brown Impulse Tire Pump is a device which will appeal to motorists as by it a large tire may be inflated quickly and without exertion upon the part of the operator. It is compact and may be stored in the automobile easily and is said to be free from complications and noise. The instrument is fitted with a special breather valve providing means for drawing in and conveying cool, fresh air to the tire, and in addition, it is equipped with a pressure gauge which automatically indicates the amount of air in the shoe. This arrangement dispenses with the usual device and its operation. To attach the pump, any convenient spark plug is removed and the former screwed in by hand until fairly tight. The motor is then started and run very slowly as the pump will deliver its full efficiency under this condition. The air hose is attached to the tire and the pressure gauge watched until the required amount is indicated. The length of the tubing is sufficient to reach every wheel. When more than one shoe is to be inflated it is not necessary to stop the motor. The pump is manufactured by the Brown Company, Syracuse, N. Y.

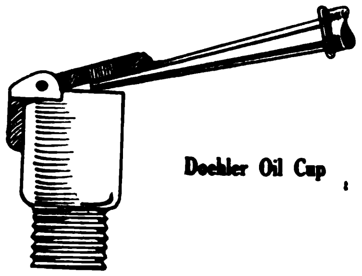
★

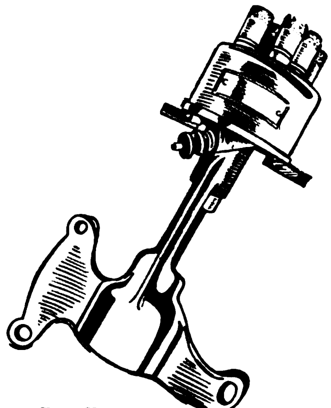
The Doehler Oil Cup is a lubricating device manufactured and marketed by the Doehler Die Casting Company, Court and Ninth streets, Brooklyn, N. Y., and a feature is that it may be attached easily by means of a screw driver. The oiler is fitted with a spring retained lid which closes on the outside of the container, this arrangement, it is said, facilitating the flow of the lubricant to the bearing. The cup may be filled easily, the operation involving the use of but one hand, as the nozzle of the oil can is inserted readily.



Doehler Oil Cup

★

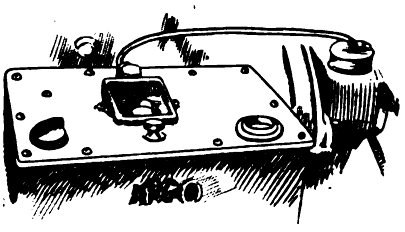
The Atwater Kent Unisparker is a device brought out by the Atwater Kent Manufacturing Works of Philadelphia for model T Ford cars and consists of a bracket and gears operating its well known system of ignition. For it is claimed large mileage with small current consumption, that synchronism is obtained and that once adjusted it does not require any attention. It may be installed easily without the use of special tools or machine work, by anyone who knows how to time a motor. The device is gear driven from the timer shaft, a pinion being attached to the latter after removing the usual commutator. By drilling two small holes in the gear-case cover the bracket is readily attached and this arrangement permits of quick removal of the member for inspection. Although the device is designed particularly for Ford cars special sets of gears and brackets are manufactured for several other makes.



Atwater-Kent Unisparker

★

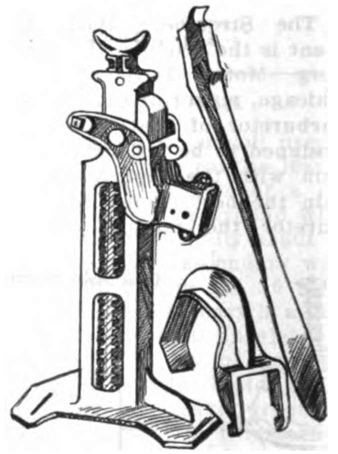
The Apco Force Feed Oiler is marketed by the Auto Parts Company, Providence, R. I., and is made especially for this concern by the Detroit Lubricator Company, Detroit, and is designed for model T Ford cars. It is fitted easily to the right hand side of the motor and it is claimed that it may be installed in less than an hour. The oil is fed into the breather pipe by means of a small tube, the latter passing through a small opening in the screen of the breather member. The mechanism of the oiler consists of a double plunger pump which pumps the oil from the reservoir through the sight feed nozzle, from which it drops, and the other plunger takes the lubricant from the sight feed chamber and forces it to the breather. Drive is by a steel belt from a pulley attached to the camshaft, the former replacing the retaining nut of the timer brush. The amount of oil fed is regulated by turning a button in front of the sight feed, this permitting of a fine adjustment.



Apco Oiler

★

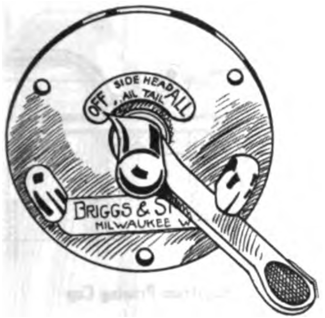
The Peerless Jack of the 1912 design, presents interesting features, inasmuch as the device may be used to remove stubborn tires as well as raise a wheel of the automobile. Believing that there is a demand for a light jack of compact size but strong enough to stand the strain of heavy work, the Oliver Manufacturing Company of 326 South Desplaines street, Chicago, brought out the new model, which is fitted with a large arched base to prevent tipping and provided with means for increasing its leverage and simplifying its lowering arrangement. It is said that it will work well in any position and that it is lowered easily by turning the handle. One of its features is a bracket which when attached to the jack and placed between the spokes of a wheel, will push or pull upon a tire, as desired. The handle is so constructed that it forms a handy tire tool. It weighs four pounds and is about eight inches in height.



Peerless Jack

★

The Briggs & Stratton Lighting Switch has been brought out by the Briggs & Stratton Company, Milwaukee, Wis., to meet the demand for a high grade switch for automobiles fitted with electric lighting. It is a four point switch of the kick type and the moving



Briggs & Stratton Switch

of the lever provides for lighting the side and tail lamps, the headlights, all five, and an off position. Any one of the groups may be utilized singly or in conjunction with others. The device is finished in either brass or nickel, polished or frosted, is compact and very attractive in appearance.

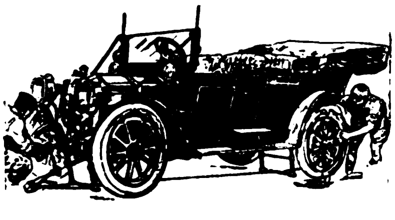
The Four-Wheel Auto-Jack and tire saver is a device for raising the entire car from the floor of the garage or ground and the operation is so simple that it is said a child can lift the heaviest automobile in less than a minute. The jack consists of two rectangular steel frames which lean against the axles of the machine at an angle. The frame bases are connected by a chain which also is attached to a powerful differential jack screw. When the latter is operated the tilted frames are drawn together which movement pushes the car backward and at the same time raises it. The device is operated easily, being laid upon the floor and the machine driven over it and stopping within a foot or so of the correct position. The rear jack is then placed under the rear axle and the front member attached. The differential lever is then turned and the machine is not only blocked securely but raised two or more inches. The chain is adjustable and the device will fit any motor car. To demount, the jack is compressed, this requiring but a few seconds. The advantages of a tool of this type are numerous, among which may be mentioned that it removes the weight of the car from the tires, increasing their service, prevents contact with oil drippings and dampness; permits of drying the shoes after being exposed to the rain and washing; allows a daily examination for cuts; facilitates the application of tire chains, adjusting brakes and mechanism, and washing. The Four-Wheel auto-jack, for which John E. Nattress, 3132 Columbia avenue, Philadelphia, is agent, is guaranteed to lift safely a load of 6000 pounds.



Four-Wheel Auto-Jack

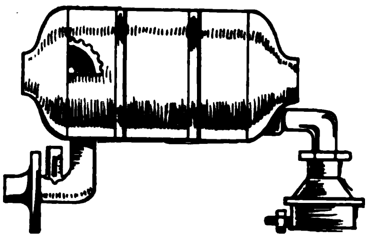
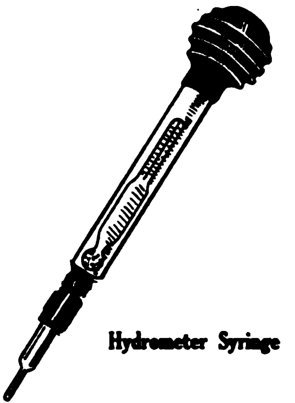
The Kerosene Gas Producer is an attachment invented by William K. Bassford, a mechanical engineer and authority on internal combustion engines, and designed for use in connection with any type of automobile, marine or stationary engine, whereby the less highly refined non-explosive fuels, such as kerosene or denatured alcohol, may be utilized instead of gasoline. The device is cylindrical in shape, about six inches in diameter, its length varying according to the horsepower of the motor, and is attached in the same manner as a muffler. It is produced in the form of an exhaust manifold when it becomes an integral part of the engine, thus permitting the use of gasoline or kerosene. In this type the control is automatic, and it is claimed that it does not require any attention upon the part of the operator. The motor is started in the usual manner, and after running for about three minutes, the kerosene is turned on and gasoline shut off, this being performed automatically by means of a thermostat, which also regulates the temperature of the gas entering the cylinders. But a small quantity of gasoline is required, this being contained in a priming tank holding about one gallon. It is pointed out by the maker that the device utilizes all of the heat units and that the low price of kerosene reduces the operating cost to about one-half of that when gasoline is employed. The gas producer is not only adapted to motor cars, but to large plants. It is manufactured by the Universal Oil Converter Company, Long Island City, N. Y., for which the Kerosene Gas Producer Company of New York City is agent.



Kerosene Gas Producer

A Hydrometer Syringe that will appeal to motorists who charge their storage batteries as well as those who test the acid of the members, is marketed by E. Edelmann & Co., 49 West Kinzie street, Chicago. The device is a combination acid syringe and hydrometer, the latter being contained in the instrument and its action is said to be very accurate. This arrangement is an improvement over the usual apparatus which consists of a jar and a hydrometer. The syringe is neat and compact and may be carried easily in the motor car.



Hydrometer Syringe

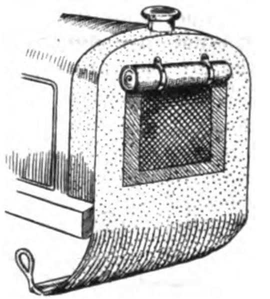
The Gordon Radiator Robe, manufactured and marketed by the Vehicle Apron & Hood Company of Columbus, O., is designed for covering the front of a radiator and protecting the contents from freezing. It is constructed of heavy, artificial leather and lined with wool, and attached to the cooler by means of straps. In addition, it is provided with a curtain which may be rolled up when the car is being operated, and lowered and fastened when the machine is standing idle. It is made in three sizes, large, small and medium.



Gordon Hood Cover

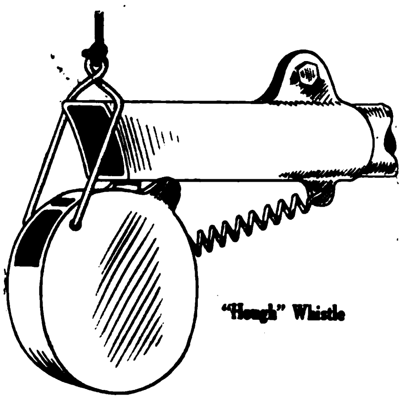
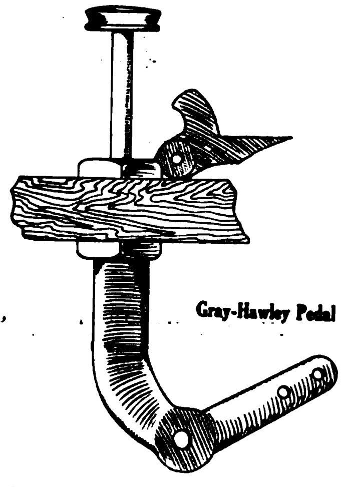
The Hough Whistle is a new type of warning signal designed especially for model T Ford automobiles and was invented by a motorist in Providence, R. I. It proved so successful in practise that the rights to manufacture the device were acquired by the Auto Improvements Company of Bristol, R. I. It is attached easily and quickly to the end of the exhaust leading from the muffler by means of a tapered tube which is split at one end and locked by a threaded bolt and nut. The other end of this part is square and slightly concave so as to fit over and partially close the opening in the drum-shaped member. The latter is attached to the part on the exhaust pipe by two hinged extensions and a spring is fitted to keep the drum from moving upward except when the signal is desired. A link is connected to the drum and the former serves a double purpose, inasmuch as the wire leading to the operating pedal is attached to this link which also checks the downward movement of the drum. When the latter is in a neutral position, the flow of burnt gases is not obstructed as they pass freely over the drum, which is made of aluminum. The tone of the whistle is mellow and far reaching in its effect. The device is moderately priced.



"Hough" Whistle

★

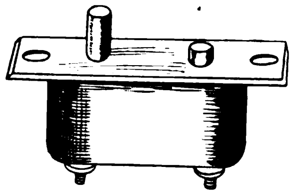
The Gray-Hawley Pedal, manufactured by the Gray-Hawley Manufacturing Company, Detroit, well known maker of motor car accessories, is an adjustable device for operating the cut-out of the exhaust or signals and is actuated by the pressure of the foot. The appliance is fitted easily by boring a .75-inch hole in the footboard, through which opening the threaded part of the member is passed and its upper end locked by a nut. The length of the part is such that different adjustments are possible by making use of the lower locking nut. The plunger rod which carries a flat head, moves easily through the stationary part and actuates a V shaped lever which is provided with two holes for the purpose of attaching the cable. The upper locking nut is fitted with a pawl member which engages with a recess in the head of the plunger when the latter is depressed. This permits locking of the pedal which is released easily by touching the member with the foot. The device is constructed of the best grade malleable iron and polished brass. It is inexpensive and may be purchased without the locking attachment.



Gray-Hawley Pedal

★

Push Button Switches of the flush type are utilized in fitting electrical devices to the automobile with a limousine body, and a neat appliance of this kind is manufactured and marketed by Frank W. Morse, Boston. These are made with polished brass, nickel, old brass, gun metal and Bauer Barff finish, and are provided with interchangeable plates. The appliance is manufactured with single, two, three or four gangs.

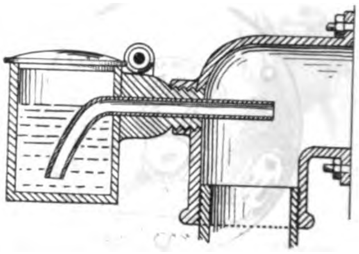


Push Button Switch

★

Wolf Head oil and greases, manufactured by the Wolverine Lubricants Company, 80 Broad street, New York City, include in addition to the regular lubricating fluids, Crystal oils which are utilized by aviators and owners of high priced motor cars and racing boats who desire an oil which, regardless of cost, will be entirely free from all carbon producing impurities. It is a pure Pennsylvania product which is filtered and refiltered until it is crystal clear; is of high gravity and flash point, and is made in light, medium and heavy grades. The company also produces a high grade of cylinder oil adapted to high speed motorcycles, as well as marine and gear lubricants. All cans and barrels are sealed when they leave the factory so that they reach the consumer in their original condition. The company also manufactures a non-flowing oil for transmissions and gears, which is recommended in preference to grease and graphite for use in cups, universal joints, etc.

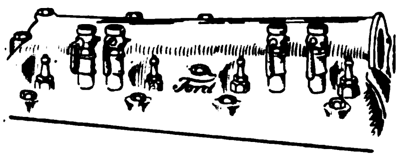
The Hagstrom Priming Cup is a departure from the ordinary form inasmuch as it is automatic in its operation. It consists of a brass vessel which is attached to the intake manifold or pipe by drilling and tapping a hole. The device for holding the gasoline is fitted with a hinged cover. To utilize the primer, fuel is poured into the cup and the lid closed. The maker, Hagstrom Bros. Manufacturing Company, Lindsborg, Kan., claims that one turn of the starting crank will start the motor. A tube leads from the vessel into the intake pipe and the gasoline is drawn into the manifold by the suction of the piston on the intake stroke, and at the same time, it is said to convert the liquid into a vapor. Auxiliary air is prevented from being drawn in when the cup is empty by the lid which is machined to a perfect fit and held securely on its seat. The device contains enough fuel to operate the motor for some little time. In addition it is said that the primer may be utilized as a decarbonizer injector.



Hagstrom Priming Cup

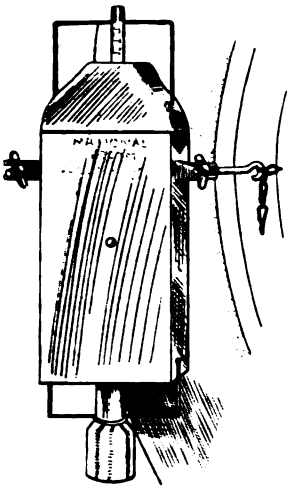
★

The Ford T Help Starter is a priming device fitted by the Home Light Company, Chicago, which concern is specially equipped for attaching priming cups to this type of motor car. In very cold weather when it is necessary to inject gasoline into the combustion chamber before the motor can be started, the spark plugs have to be removed if the engine be not fitted with priming cups. The Ford T is not equipped with these devices, and the construction of the cylinder head, which is one piece, is such that extreme care is essential in boring this part. The company guarantees a gas and water tight job which necessitates the sending of the cylinder head to its plant.



Ford Help Starter

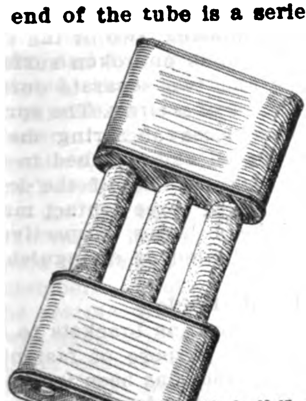
The National Steam Vulcanizer is a handy vulcanizing outfit that may be carried in the tool kit of a motor car and is manufactured by the National Motor Supply Company, Cleveland, O. It is operated by steam which is favored in this work, and which is said to eliminate the danger of burning the rubber. The device is a hollow brass shell which is partially filled with water, and the fluid is heated by a wood alcohol lamp. It is adaptable to any sized tube or casing, requires but a few minutes to generate steam, and is fitted with a thermometer. It may be operated with the tire on the wheel.



National Steam Vulcanizer

* * *

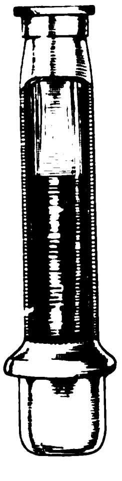
The Mondex Muffler presents interesting features inasmuch as it it claimed that it is self-cleaning, prevents back pressure and is compact and light in weight. It comprises three pipes of seamless tubing, connecting two expansion chambers, and the two outside members, which run its entire length, are spanned over the heads at each end. The exhaust enters through the first tube and travels throughout the muffler. At one end of the tube is a series of perforations, the sum total of these being three times the diameter of the pipe. Passing through these openings, the gas enters the first expansion chamber, then through the centre tube to the second chamber, after which it expands through perforations in the third tube and a tail pipe into the open air. As the two chambers are exposed to the air, cooling is facilitated. The device is free from bolts, nuts, cups or baffle plates, the chambers being held together by steel bands shrunk into position. Inside the outer casings of the chamber is a layer of asbestos, which is encased with galvanized iron. It is made by the Aristos Company, New York City.



Mondex Muffler

* * *

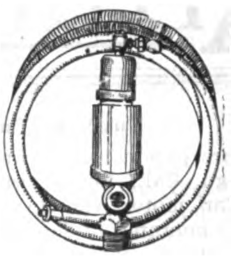
The Vanometer is a new form of a fuel gauge fitted to the dash where the operator may note at a glance the amount of liquid in the tank, and is manufactured by the Van Auken Indicator Company of 123 Liberty street, New York City. The device is operated by liquid balance and is connected to the tank by a tube. A coil of copper tubing, which is adjustable, is inverted in the top of the container and extends to the bottom. The fluid in the Vanometer, which is .5 inch wide and 3.5 inches high, is red, being a special chemical compound of certain specific gravity and will withstand a temperature of 20 degrees below zero, Fahrenheit. The tube connecting the indicator and tank contains air which rises and falls according to the amount of gasoline in the latter. This raises or lowers the colored fluid, and it is claimed that its registration is not affected by grades. It is attached easily, and having no mechanism to get out of order, is durable.



Vanometer

* * *

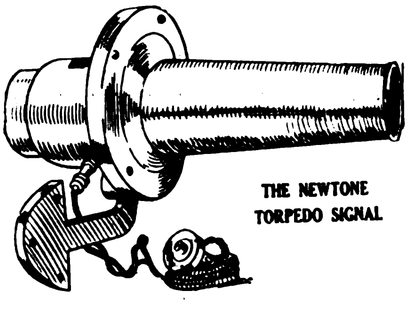
The Spark Plug Pump, marketed by the Mayo Manufacturing Company, Chicago, is a new form of tire inflator which is operated by the motor. It is attached easily and quickly by removing a spark plug and inserting the member and it is claimed the operation may be performed with the hands. The pump is on the compound principle and utilizes pure air supplied by an intake valve and compounded to high pressure into the upper cylinder of the member and thence forced to the tire. When in use the engine is run at a low rate of speed, and it is said that a shoe may be inflated to 150 pounds pressure in a few minutes. All working parts are substantial and the piston is fitted with rings. Interchangeable connections make it adaptable for different sized spark plug openings.



Spark Plug Tire Pump

* * *

The Newtone Torpedo is a new signalling horn produced and marketed by the Automobile Supply Manufacturing Company of Brooklyn, N. Y., and the design is such as to add to the attractiveness of the car. It is operated by a new electric motor brought out by this company. The fields of the motor are made up of 75 thin discs of special steel thoroughly insulated and its construction produces more power with less current consumption. The motor actuates a rust proof diaphragm and the device does not require oiling, or sound adjustments, and its warning note is powerful and far reaching in its effect. The shaft of the motor runs on imported ball bearings which require no attention whatever and its easy running qualities with the construction of the steel laminated fields, lengthen the life of the battery. The device is constructed of the best materials and the workmanship is first class in every particular. It comes complete, including bracket for attachment, press button switch and ample length of flexible cord. The company also markets two other models, one of which is adapted to small vehicles.

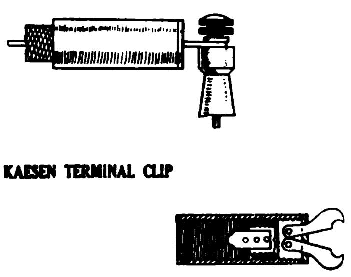


THE NEWTONE TORPEDO SIGNAL

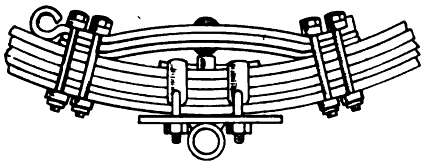
RECENT PATENTS of INTEREST

Auxiliary Fuel Supply.

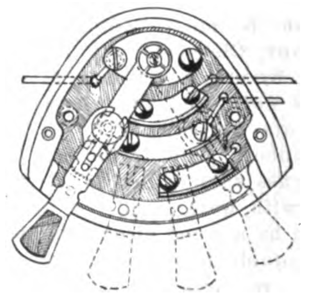
Letters patent have been issued Edward C. Smith, San Diego, Cal., for a gravity feed emergency fuel device for motor vehicle. It comprises a gasoline container mounted under the hood and near the radiator, and of peculiar shape, being flat on one side and curving to a point at the lowest end. A pipe is led from the vessel to the carburetor and interposed in the line is a stop cock which is operated by means of a rod extending upward and through the dash to a position convenient to the operator. Another pipe leads from the upper portion of the auxiliary tank to the main supply line and is connected thereto. The pipe leading to the extra vessel is fitted with a check valve its object being to allow the fuel to flow from the regular tank by gravity to the auxiliary member, but not back into the former. The small container is automatically filled by gravity as the main member is considerably higher and the fluid flows through the usual channels to the extension and thence to the emergency vessel. Here it is held by the stop cock until required. The auxiliary tank is fitted with a safety valve also a wall with air spaces to protect its contents from the heat of the motor, as well as to provide a circulation of air. It is claimed of the device that in addition to providing emergency fuel a flow of gasoline may be furnished to the carburetor with the car operating on unusually steep grades.



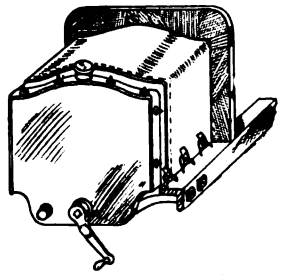
KAESEN TERMINAL CLIP



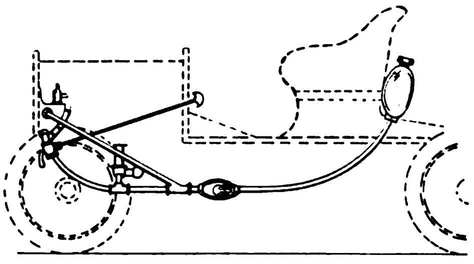
EMERGENCY SPRING DEVICE



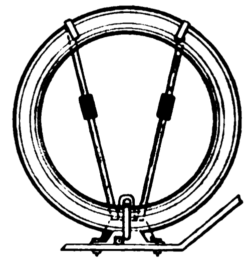
MULTIPLE LIGHT SWITCH



BULLOCK HOOD AND RADIATOR COVER



EMERGENCY FUEL DEVICE



CAMPBELL TIRE HOLDER

Some Patents Applicable to the Motor Car and of Interest to Owner, Maker and Manufacturer of Parts.

Emergency Spring Device.

Broken springs are not uncommon and among the devices intended to make a temporary repair is the invention of George S. Spreyer, Canon City, Col., to whom a patent has been issued. It differs from the usual construction of these appliances inasmuch as the leaves of the springs are riveted together at the centre, although the members bear loosely upon one another. The ends of the springs are so spaced apart that when clamped together they form a resilient spring end. An upturned extension is provided at one extremity while that of the opposite end is equipped with an eye and means are adapted to bear on the upturned extension and pass through the eye for securing the ends of the auxiliary spring on opposite sides of the line of cleavage in the vehicle spring.

Multiple Electric Switch.

A patent has been granted to Edward E. Taylor and David H. Elkins, Amesbury, Mass., assignors to William Gray of the same place, for a multiple electric switch for lighting purposes. The device is similar in construction to the usual ignition members, being fitted with a throw lever which is pivotally mounted but so arranged that three movements are provided from right to left in operation. The first lights the side and tail lamps; the second, the head and tail members, and the third, all five lamps, this arrangement providing means for lighting the different members at the will of the operator. This is accomplished by means of three separate insulated contact pieces within the switch housing, two of the contact members having a continuous unbroken surface, while the third has a base and two separate curved surfaces located in the same arc of a circle. The spring lever is fitted with contact pieces of spring metal. The wire from the battery is led and attached to the terminal forming the retaining member of the lever and a single lead from each of the three contact members to the tail, side and head lamps, respectively, any group of which may be lighted or extinguished, as previously outlined.

Tire and Trunk Holder.

Many motorists object to attaching brackets to the body of the motor car for the purpose of fastening the extra tire and trunk. A patent has been issued to Archibald U. Campbell, Toledo, O., for a combined tire and trunk holder which obviates the use of body attachments, and in addition is adjustable permitting the retention of different sized shoes, a feature which will appeal to motorists when exchanging their machine for one equipped with larger or smaller tires. The locking device consists of a base block which is attached to the running board and provided with a movable lug which rises from the inner side and extends outwardly and downwardly over the tire, and means are provided for locking the bar to the base member in the usual manner. Two telescoping arms are attached at one end to the base block extending upwards, and are provided with curved ends for the purpose of securing the shoe. The design is such that a tire cannot be removed by forcing it away from the upper supports as the lower part of the shoe is held securely by the locked lug. In addition it is claimed that a tire may be removed or replaced in a few seconds as there are no straps to unbuckle, the operation involving merely unlocking the lug.

Electric Wire Terminal.

A device for the purpose of connecting electric conductors with spark plugs in internal combustion engines, although the appliance is not limited to spark plugs in its scope, has been patented by Julius Kaesen of New York City. It is claimed that by it a connection may be made quickly and securely to the central electrode of a spark plug or binding post of any telegraph or electrical instrument, and that its construction is such that it cannot work loose. It comprises an internally screw threaded sleeve and an externally screw threaded member is said sleeve with its threads in engagement with the former, also a fastener at the inner end of said body for the conductor. A pair of jaws are pivotally mounted to the inner member. In attaching the device the outer sleeve is unscrewed and moves backward allowing the jaws to expand. To fasten the latter, the sleeve is rotated in an opposite direction, which movement closes the jaws firmly upon the electrode or binding post as the case may be. The device for attaching the wire consists of a strip riveted to one side of the inner member and extending beyond is bent over and doubled upon itself to produce, with a screw, the fastener proper.

Hood and Radiator Covering.

A covering for the radiator and hood of a water-cooled motor car, the design of which is such that one or both parts may be protected from the cold or elements, has been invented by Calvin Bullock of Denver, Col., to whom a patent has been granted. It comprises three parts; namely, a body member for covering the hood, a relatively narrow strip for the top and sides of the cooler, and a third or cap member for the exposed end of the radiator. The third member is designed for use in cold weather and is fastened to the narrow strip by a form of curtain fasteners which makes for easy removal. The hood member is held in place by straps fastened to buckles attached to the side board members of the frame. When utilized in the summer the hood device is intended to prevent water and moisture reaching the power plant, which might be seriously affected by it.

TUBING FOR ACETYLENE GAS.

Few cars come equipped with tubing that is really satisfactory for conveying gas from generators or tanks to the headlights. As a rule the lightest tubing is employed but this does not give good results, as it cracks, easily producing minute leaks and consequently reducing pressure. Often the burners are blamed when the fault lies with the tubing.

A heavy thick tubing should be used. This is more costly at first but better results will be obtained. Another type of tubing is the metal wound supplied by gas companies for use with the inverted mantle incandescent reading lamps. Where copper tubing is employed with short rubber tubes to complete the system, the latter should be wired where they join the lamps and at the unions.

AUXILIARY EXHAUST PORTS.

A repairman whose experience was confined to the water-cooled type of motor was asked to locate a skip in an air-cooled car. The miss was intermittent; that is, was not confined to any particular cylinder and the driver of the machine had worked for some time without results.

The usual tests were applied in the ignition system and this was found to be in order. The owner stated that he had ground the valves and the compression was approximately even on all four cylinders. The valves were retimed, which improved matters slightly. Even cleaning and readjusting the carburetor had no effect.

As the operator had assured the repairman that the valves had all been ground in, little attention was paid to them, but finally the workmen examined these members. Those on the cylinder heads were found to be seating properly. Upon replacing them the motor was again started, but it missed explosions. The auxiliary exhaust ports were next considered, and it was found that one of these was partially choked with carbon. Upon removing the soot and regrinding the seats the engine ran perfectly.

SLIPPING DISC CLUTCHES.

Multiple disc clutches require proper care if good results are to be obtained. Sometimes a car will be brought into the shop and the operator will complain that the clutch slips in starting and is slow to take hold. This may be due to improper adjustment or to the fact that a suitable oil is not being used. Too much or a too heavy grade will bring about the above result. The motor should be turned over until the oil plugs are on top and these removed. A pint of kerosene is then poured in, the plug replaced and the motor turned. This should be done slowly and by hand. Some make a practise of starting up the engine; this is wrong as at speed the lubricant is held to the circumference of the case, and does not flow through and flush the plates. After this has been done the parts are washed with gasoline and refilled with the required amount of lubricant recommended by the maker. Some utilize a mixture of cylinder oil and kerosene which is said to give good results.

SIMPLE OIL TESTS.

While there are many brands of reliable cylinder oil upon the market the owner of a repair shop is often tempted to try a new lubricant, especially if the agent quotes an attractive price. The experienced repairman, having once found a satisfactory article, sticks to it even if it is more costly than others.

Lubricating oils made from asphalt or other crudes, and then bleached to obtain a light color are said to be injurious to a motor. The acid treatment not only lightens the harmful but the better ingredients as well. This process is utilized as it is cheap, but some of the acid remains in the operation and this will corrode the cylinders and bearings if the engine be allowed to remain idle for any length of time.

The oil may be tested easily to determine if acid has been employed, by saturating a piece of cotton string or twine and wrapping it around a polished shafting or metal. This is exposed to the rays of the sun for about eight hours. If the metal be slightly corroded after removing the cord it shows that some of the acid still remains.

Weight of Belting—To find the approximate weight of leather belting in pounds, multiply the length in feet by the width in inches, and divide the product by 13 for single and eight for double forms.

MECHANICAL POINTERS for GARAGEMEN AND OWNERS

GASOLINE STRAINERS.

Many motorists strain gasoline through metal filters the mesh of which is not fine enough to prevent the passage of water or other fluids present in the fuel. Tests have shown that water will pass through a 90 sieve very easily, especially when all of the fuel has been poured. A 120 mesh, or finer, should be fitted to all straining devices as gasoline has such a low viscosity and other physical qualities that it will filter readily. Much of the deposits found in carburetors is due to poor filtration. A recent analysis developed that 48 per cent. was volatile oily matter, and of the balance 16 per cent. was carbonaceous matter and 36 per cent. fixed mineral, consisting of clay, oxide of iron and lime, fine sand, etc. It is evident that the greater part of this is road dust as an analysis of the deposit in cylinder showed the same results as that in the carburetor, in that the composition of the earthy matter was very similar.

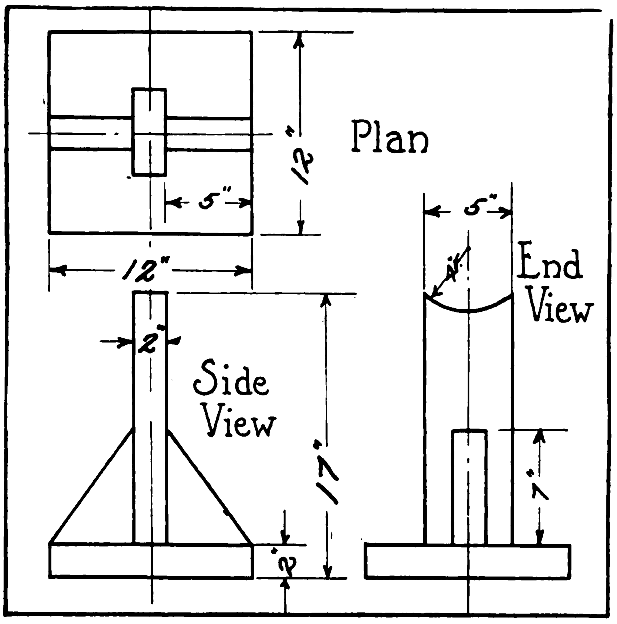


Fig. 1—Home Made Axle Support for Motor Cars.

The writer recalls an instance of this kind in a four-cylinder motor the pistons of which were covered with a gray colored substance which upon close examination proved to be road dust. The carburetor was not protected by a gauze or the engine by a pan. The air passage of the vaporizer was at the bottom of the device which permitted easy access of foreign elements. A pipe was attached and ran upward to a point close to the exhaust manifold which method not only prevented the entrance of dirt but aided carburetion. Before the advent of water jacketed carburetors and before metal pans were employed, some makers fitted a tube, one end of which was of fan shape design and placed close to the exhaust manifold.

AXLE SUPPORTING DEVICE.

Some owners put their machines away for the winter and when this is done it is essential that the wheels should be jacked up so that all weight and strain is removed from the tires. An inexpensive and easily made device for this purpose is suggested by H. M. Nichols of Kinyon, R. I., and illustrated at Fig. 1. The dimensions given are for a medium sized car and can be altered to meet the requirements of the design.

The base is made from a piece of two-inch plank, 12 inches square and attached to this is an upright, the upper end of which is recessed to take the axle, being so formed as to prevent it from sliding off the support. This is made from a 15-inch piece of 5x5 joist, one end of which is nailed to the base. The upright is braced by two triangular shaped members, five inches wide and seven high. These are securely fastened.

The application of this device is very simple. One wheel is raised by the jack, the support introduced and axle lowered until it rests in the recess of the holder. This is repeated until all four are in position. The air is then let out of the tires. Even in such a simple operation as that of jacking up a wheel the novice is apt to make errors as he is liable to place the tool in a position that is most convenient, but at the same time very impractical. It is a good plan to set the brakes of the rear wheels to eliminate the danger of the car rolling off the jack while the front members are being raised. This precaution is important, especially when the wheel is to be removed. The writer knows of cases in which the car fell, resulting in broken steering knuckles and bent spindles. Even with the wheel on, considerable damage may result, to say nothing of danger to the operator.

The proper way to jack up a front wheel is shown at Fig. 2 A. The tool is under the axle, but if the latter cannot be utilized the head of the lifting device may be placed under the spring or saddle, as denoted by the dotted lines. Another position is under the nut of the spring clip. The only objectionable feature of the latter is possible damage to the thread of the bolt in the event of the tool slipping, but this may be overcome by the insertion of a piece of wood.

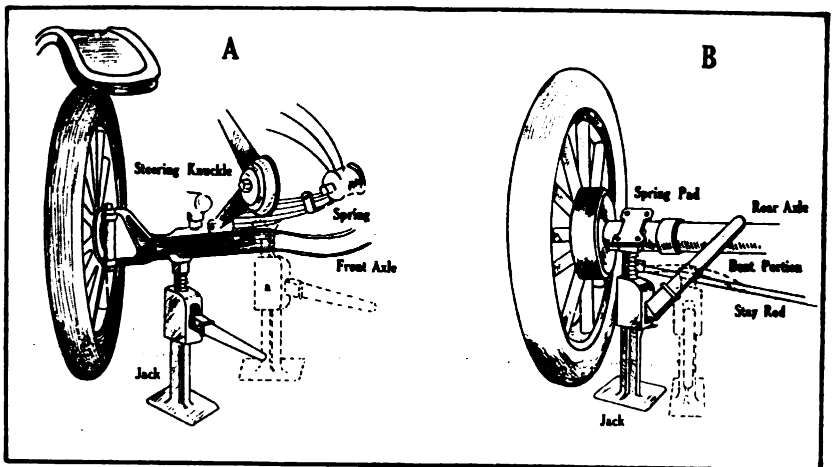

Fig. 2—Proper Use of the Jack: A, How to Raise the Front Wheel; B, Correct Position at Rear Member.

Care should be taken with the rear wheels where truss rods are employed in the construction of the rear system. The jack should not be placed so that any strain will come upon the former, although the lug to which the end is attached may be utilized. The proper location is illustrated at B. The dotted lines depict the wrong way. When this method is used much damage to the rear mechanism may ensue. If the rod be bent, crystallization is quite likely to follow, causing it to break down should a severe strain be placed upon it, and at the time it is designed to be of value and reinforce the rear axle housing. If on the other hand, the rod be flexible, elongation will take place, and if not properly readjusted, misalignment of the rear axle mechanism will be brought about. These precautions should be observed when replacing the jack with a support.

FAN BELTS AND FASTENERS.

While the modern car is fitted with a device for adjusting the tension of the fan belt there are many machines which are not provided with such an attachment. Some fans are driven by grooved or V shaped pulleys, operated by round belting. The usual manner of fastening the ends is by utilizing a C hook or fastener but these are noisy and in addition are neither neat in appearance nor secure in operation.

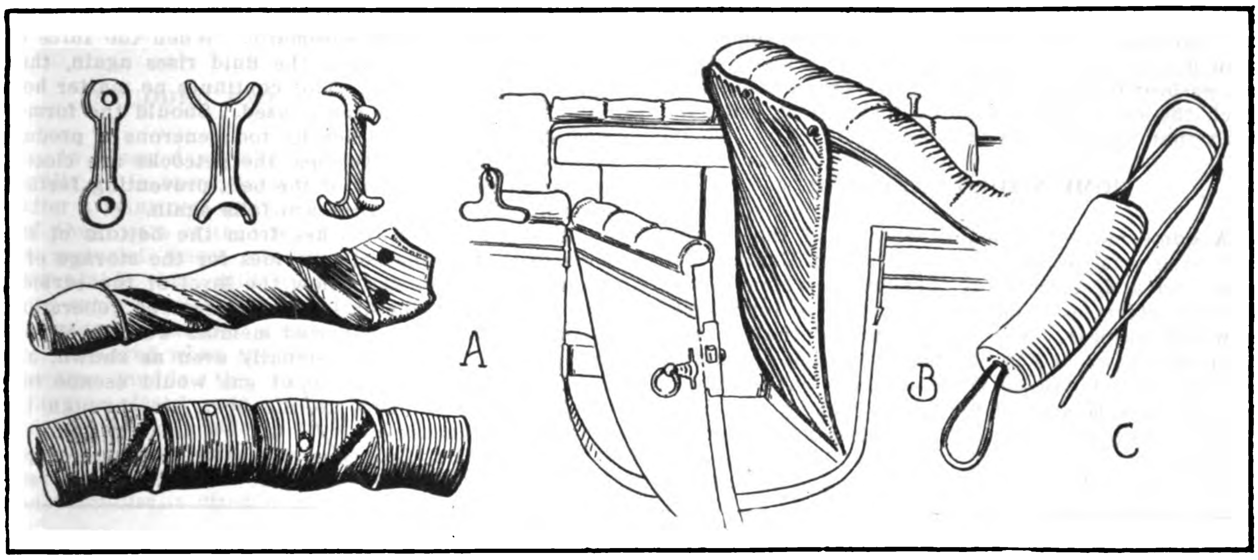

Fig. 3—Some Hints for the Owner: A, Fan Belt Hook Made from Bicycle Chain; B, Panel Body Protector; C, Anti-Rattling Speedometer Cable Device.

A twisted hide belt has many advantages over the former kind, provided it is secured firmly and this may be accomplished by using a grappler hook such as shown at Fig. 3 A. It can be made from a suitable side plate off a bicycle chain. The metal is cut across the rivet holes and the ends slightly spread. One end is twisted, as depicted in the drawing, by heating and turning with a pair of pliers. The points must be turned left or right hand, according to whether the belt has a left or right hand twist. Two holes are punched through the ends into which are inserted the points of the fastener.

Where flat belts are fitted and no provision made for an adjustment, considerable difficulty is experienced in fastening the ends as well as to obtain perfect alignment at the connection. It is a good plan to stretch the leather before using and this may be done by hanging it up for a week or so with a heavy weight attached, and rubbing into it as much castor oil as it will absorb. When ready for use bevel off the ends to a gradual taper and then get a harness maker to sew them together. A few countersunk rivets may be added. If it be dressed occasionally it will give long service.

BODY PANEL SHIELD.

Nothing detracts more from the appearance of a car than having the back panel of the front seat scratched up, especially if the paint and varnish on the other parts be nice and shiny. Some persons are careless in arranging luggage carried and this often mars the panel, particularly when there is little room in the tonneau. An owner who was careful about the appearance of his automobile, bought a new machine and before he carried passengers fitted a felt shield to the panel as shown at Fig. 3 B. The protector was so arranged that it could be removed and was held in place by the usual curtain fasteners. These were placed on the sides, top and on the floor. The device might be made longer and, rolled up at the bottom, serve as a cover for luggage in stormy weather.

ANTI-NOISE CABLE DEVICE.

Sometimes rattling noises in the car are due to the speedometer cable. When the gears are loosely meshed and the elbow joint full of play the drive shaft container will oscillate and come in contact with the steering arm. An inexpensive and easily made device is shown at Fig. 3 C, consisting of a leather lacing looped through a piece of thick rubber tube. The loop is passed around the steering arm and the ends of the lacing attached to the cable, which will secure it. The rubber forms a flexible distance piece.

RAIN WATER IN THE RADIATOR.

A prominent manufacturer of radiators recommends the use of distilled water and when this cannot be obtained advises rain water which is superior to that obtained from wells or through the pipes of the house system. When the latter is heated, especially if hard, it forms a boiler scale in the jackets of the motor which is deposited in the radiator as a fine, brick colored dust. This materially reduces efficiency and will in time clog the member. The use of some anti-freezing compounds tends to thicken the water and eventually form a deposit on the sides of the tubes. It is a good plan to drain the solution from the circulating system occasionally, and clean out the latter after which the mixture may be replaced in the radiator.

ELIMINATING CHATTERING BRAKES.

Where brakes are of the metal-to-metal type the members have a tendency to chatter and especially so when situated on the front end of the driving shaft. Oil or grease as a preventative is not lasting as a cure. A better substance to use is graphite, which enters the pores of the metal surfaces, and owing to its being able to resist the heat necessarily set up by the brake action, the benefit derived is more lasting.

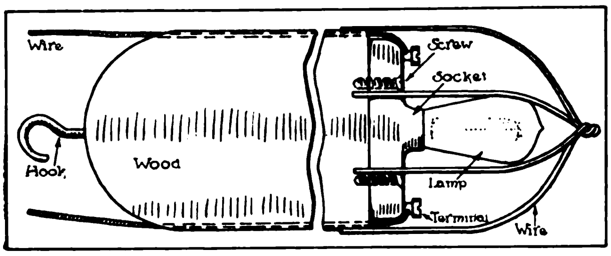

Fig. 4—Inexpensive and Easily Made Portable Lamp.

It also is an excellent material to use in lubricating clutch plates which are apt to grip harshly when the car is started from rest or in changing gears, as it appears to counteract the suction of the oil. The effect of this drawing movement is to make changing difficult in this respect when a clutch is withdrawn only partially. The reason of the improvement is again due to filling up the pores of the metal discs, and so providing an almost glass-like surface, upon which the oil suction can take little effect, with the result that shifting speeds is easier.

HOME MADE GENERATOR.

A home made acetylene generator of the "diving bell" type was designed recently by an English motorist and a description of the device, which is said to have given excellent satisfaction, is reproduced from the Autocar. The components of the gas producer are shown at Fig. 5, that at A being a sectional drawing, and it will be noted that the outer body of the container is utilized for water, baffle plates being fitted to prevent the fluid from splashing and consequent loss.

The diving bell is outlined at C, and in this are placed the parts illustrated at B, the latter including a perforated tube over which is fitted a cone. The carbide surrounds this and is prevented from falling into the water by the inverted cone fastened to a baffle plate or guide, which carries an attachment preventing the internal parts from dropping when the generator is being recharged.

The water works up through the tube from the bottom to the carbide in the event of the decomposed material blocking up the small holes in the cone and baffle plate, and sealing the clearance between the former and the sides of the container. Under the circumstances described the fluid would find exit through the small holes in the walls of this member. The top is provided with a cap to prevent the entrance of the carbide.

The action of the device is as follows: The water container is filled to such a level that when the diving bell containing the carbide and air is dropped into place it will rise to within .5 inch of that of the baffle plate. When acetylene is required, the petcocks are opened; slightly at first to obviate sudden immersion of the material and consequent waste of gas owing to its being generated more quickly than the lamps can use it. This allows the imprisoned atmosphere to escape from the diving bell and permits the water to enter at the bottom.

The rising fluid attacks the carbide at the bottom of the cone, causing acetylene to be generated. This process then becomes automatic. When the force of the gas in the bell falls, the fluid rises again, thus restoring the pressure. This continues no matter how quickly or slowly the gas is used. Should the former rise above normal, either by too generous a production of acetylene or because the petcocks are closed, the water is driven out of the bell, preventing further generation until the pressure falls again.

The space of 1.5 inches from the bottom of the cone to that of the bell provides for the storage of a small quantity of gas below the level of the carbide, and for a little fluctuation in the rate of generation. If the bottom of the inverted member were level with that of the bell, or occasionally even as shown, any momentary overproduction of gas would escape into the water, and thence to the open air through the small holes in the lid.

The box, lid, bell, cone and baffle plate are of galvanized iron, well soldered at all joints and rein-

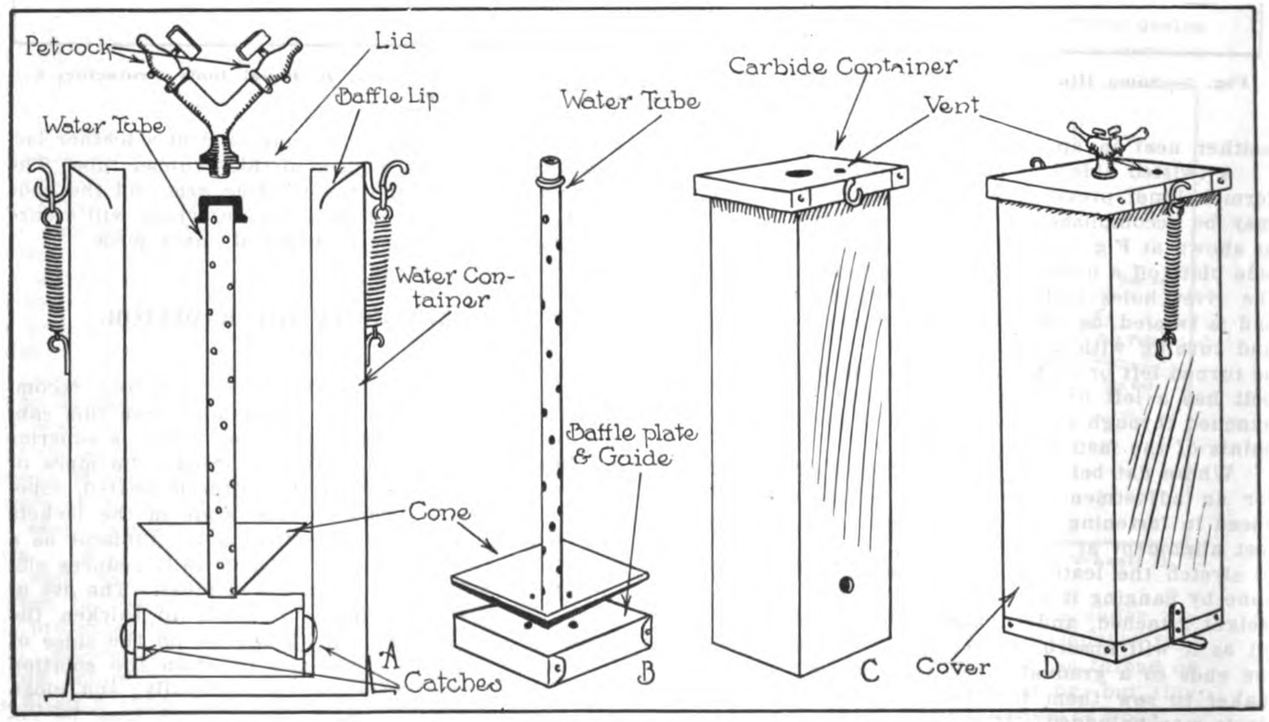

Fig. 5—Method of Constructing Home Made Generator: A, Sectional View, Depicting Components; B, Cone and Baffle Plate and Guide; C, Carbide Container; D, the Device Assembled.

forced with small rivets. The lid should be a nice easy fit, so as to drop into its place without the use of force. The twin taps or separate members will have to be purchased. The devices utilized to hold the lower parts of the bell together are similar to those used on doors or cupboards. These will have to be made in the walls of the bell and soldered to the inside of the baffle plate. In the generator outlined the holding members are steel balls and these are oiled to prevent rusting. They also are connected with a piece of copper tubing which is soldered in place to form a handle by means of which the parts may be withdrawn.

The water tube may be a piece of .375-inch brass piping such as is used for gas fittings, with small holes drilled as shown and the top closed by a cap. The tube must be soldered to the cone and baffle plate and these must have about four small holes drilled for the passage of the water.

The lid and bell are held down by miniature bonnet catches operated quickly and superior to the usual screws employed. They may be made easily from strong brass wire, and the springs can be obtained readily from any hardware store. The hooks are soldered to the lid and the eyes to the walls of the container. A small vent hole should be drilled in the lid to allow the escape of surplus water and gas. The device may be attached to the running board by means of angle brackets with small bolts and wing nuts on split washers.

STUDDED AND PLAIN TREAD TIRES.

In these days when the highways are oiled liberally it is more or less difficult to secure traction after a rainstorm and many owners fit the rear wheels of their cars with tire chains to prevent skidding. A motorist whose machine was equipped with demountable rims, utilized metal studded shoes for the two extra appliances carried on the automobile. The latter was equipped with smooth tread casings which he employed when the roads were dry, but when they became muddy, the anti-skid members were fitted. One was placed on the inside back wheel and the other on the opposite side in front. This, he claims, gave much better results than using them on the driving members. With an equipment above referred to the automobilist is fitted to meet all road conditions.

CARE OF DEMOUNTABLE RIMS.

With the introduction of the demountable rim the motorist took it for granted that being equipped with one or more extra shoes ready for attachment the troubles connected with the fitting of an ordinary tire were at an end. It is a comfortable feeling to know that in the event of a puncture or a blow-out a casing with the tube inflated is ready to slip on, and that the operation requires but the loosening of a few nuts or appliances and the readjusting of these members.

With the regular type of tire it is considered good practise to keep the rims cleaned so that the work of removing a shoe may be facilitated. The demountable rim should receive similar attention; space between it and the surface to which it is fitted, will allow water to penetrate easily and rust to accumulate. Dirt also will collect and if the device be not removed for some time considerable difficulty may be experienced in the operation.

These members should be cleaned occasionally and while the use of paint is recommended a quicker and an equally efficient method is to utilize a mixture of graphite and oil. The former is an excellent lubricant and will resist the action of the water. The writer has employed it on rims utilizing the ordinary type of tires and the latter have no signs of injury in any way by its application.

TWO-SPARK IGNITION.

As the greatest efficiency of the hydrocarbon engine is developed by the complete burning of the charge to bring this about it is essential that the spark igniting the mixture should be of proper strength. It is an established fact that when the flame is weak the power output is affected thereby. The combustion of the vapor in the cylinder of an automobile may be compared with throwing a stone into smooth water. Where the missile comes in contact with the surface a small circle appears and others follow of increasing size.

The advantage of double ignition, or two sparking plugs operating at once, has been proven by experiments, it being demonstrated that with the members placed over the inlet and exhaust valve a considerable increase of energy was derived over that of the single system. The power was further augmented by the installation of one of the devices in the centre of the explosion chamber. This is due to the fact that the gas is ignited in two places and the combustion is consequently accelerated thereby.

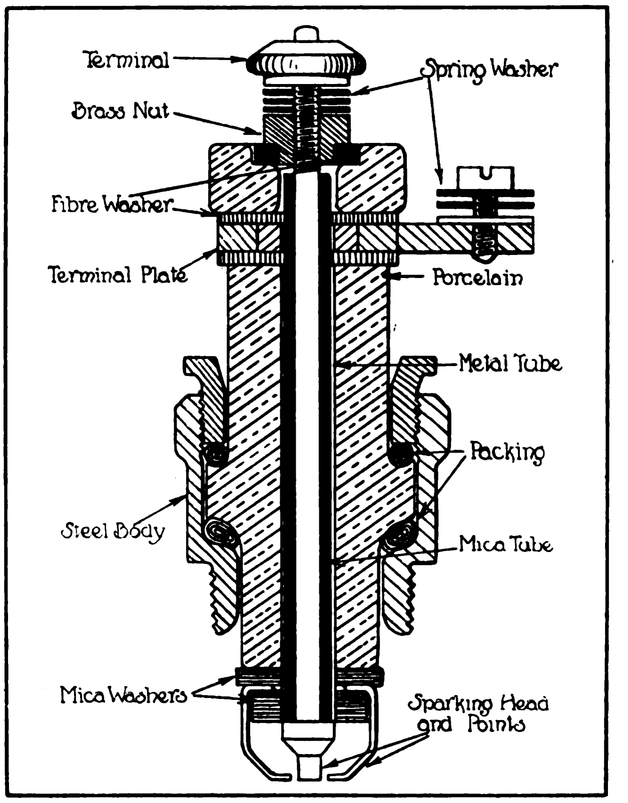

Fig. 6—Components of Multiple-Pole Spark Plug.

In fitting the double-plug system to a motor, one member should be a double-pole, the components of which are depicted at Fig. 6, and the other may be of the ordinary type. The former consists of two concentric electrodes well insulated from each other and from the metal body which is screwed into the cylinder. It will be noted that the head is longer than that of the usual device and this construction is an advantage as it will project farther into the combustion chamber.

The method of wiring is illustrated at Fig. 7. The usual high-tension lead is attached to the terminal of the double-pole member while another cable is fastened below this and led to the ordinary plug. The current first passes across the points of the former, thence to ground through the latter. In experimenting with this system the operator should bear in mind that because of the quicker burning of the charge, any advance of the spark will result in a backfire. Care should be taken to note the position of the piston at the time the ignition is supposed to take place, when setting the timer for this system.

ENGAGING THE REVERSE GEAR.

The operation of engaging the reverse gear in the sliding type of transmission is difficult to some drivers and the trouble experienced doubtless is due to the fact that with many gearboxes the action involves the enmeshing of one pinion with two others, either simultaneously or consecutively. If all three be at rest, as two are likely to be if the car be stationary, it is obvious that the meshing of them will not be an easy matter, for the chances are that either one pair or the other will not be in correct position; that is to say, each tooth will not be opposite its corresponding space.

If the clutch pedal has been depressed fully and the stop be in contact, the chamfering of the teeth will not allow those which are incorrectly placed to draw into one another. If the clutch be withdrawn slightly, just enough to allow it to touch the stop, the various shafts will be free to rotate through the few degrees necessary to allow the chamfered teeth to register. When the gears will not engage it is bad practise to jerk the lever to and fro in the hope that force will attain the object in view. Instead of this a light pressure should be maintained upon it and the clutch pedal raised gradually, so that at the moment the internal friction of the clutch tends to rotate the shafts the pinions may be engaged quietly as the respective teeth and spaces come opposite each other. A great fault with many drivers is to attempt to engage the reverse gear after using a forward speed before the car has come to rest, or vice versa. This means that they are trying to mesh gears that are revolving in opposite directions which produces noise, grinding and subsequent wear upon the parts.

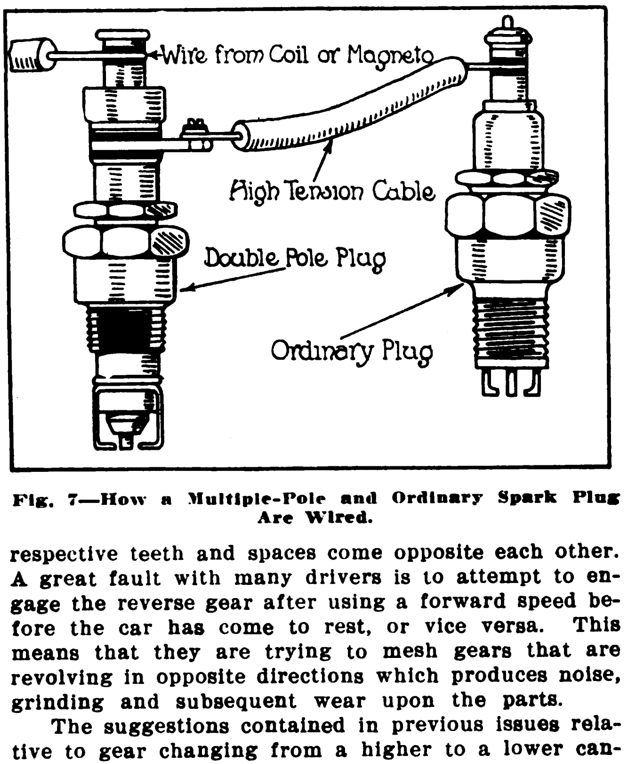

Fig. 7—How a Multiple-Pole and Ordinary Spark Plug Are Wired.

The suggestions contained in previous issues relative to gear changing from a higher to a lower cannot always be followed under some conditions, such as operating in traffic. When a car is being driven slowly on the top speed, but owing to conditions has been slowed down behind a vehicle moving at a lesser rate, this necessitates the release of the clutch and the engagement of a lower gear before resuming travel.

Under these circumstances some drivers make more noise and experience more trouble in changing down than under normal conditions, such as ascending a grade. The reason for this is that there is even more inclination to depress the clutch pedal more fully when changing down and this brings the stop in action, decreasing instead of accelerating the speed of the shafts.

The difficulty may be overcome by opening the throttle and increasing the speed of the engine, releasing the clutch partially, then moving the lever slowly from one gear to another, which should be accomplished without exerting undue force. The reason for accelerating the motor is to insure that it shall be running faster than it would if the top gear were driving, so that the internal friction, while the pinions are crossing the neutral zone when the change is being made, may increase the clutchshaft to the speed at which it will be running when the lower gear is in mesh.

In changing down it should be borne in mind that the clutchshaft must be accelerated before the pinions are meshed. If it cannot be effected by one of the methods suggested, all of which use the engine as a medium, it can only be brought about by force with its attendant noise and damage.

HOME MADE PORTABLE LAMP.

Many motorists keep their machines in a garage which is not lighted by electricity and when it is necessary to make some slight adjustment of the mechanism at night, more or less danger is present in utilizing a naked flame. There are several forms of portable electric lamps which may be attached to dry cells or a storage battery and one of these which may be made easily and at little expense is shown at Fig. 4.

The device was produced by an owner who possessed the needed materials, which consist of a six-volt incandescent lamp, a socket and flexible lamp cord. The socket was screwed to a round piece of wood about three inches long and two grooves were cut in this holder, one on either side, a strand of the wire being led to each terminal as depicted in the drawing.

Several pieces of wire were twisted together at one end and bent into a cage as outlined, while their other extremities were set into recesses in the handle of the device. The latter was then bound with friction tape to hold the ends of the protecting screen, and a hook was provided so that the light might be suspended while being utilized. The cord was of sufficient length to enable the use of the lamp around any part of the automobile, and the ends of the leads were fitted with snap terminals for the purpose of easy attachment to the battery. In the event of the bulb breaking it can be replaced by springing apart two of the wires surrounding the lamp.

WHEEL BEARINGS NEED ATTENTION.

With the approach of winter when the roads are more or less muddy and slippery due to the freezing and thawing of the surfaces, there is considerable strain upon the wheels because of skidding. The bearings and locking devices should be examined carefully and any play remedied by adjustment. Where ball bearings are utilized care must be exercised as if the adjusting cone be too tight considerable wear will follow. An easy method is to loosen the check nut and turn the cone until it bites, then slack off about half a turn, screw up and fasten the nut.

CARE OF GOGGLES.

Automobilists who use goggles, especially if they are of an expensive pattern, should not suspend them by the elastic webbing for any length of time as the material will stretch. Those who make it a practise to hang them on the steering wheel or other parts of the machine, discover that the clips must be adjusted frequently, and that sooner or later the metal buckles come in contact with the back of the ear or some other tender portion of the head, causing considerable discomfort.

Action of Electricity—It has been found that a brazed copper pipe joint may deteriorate rapidly to the point of failure by the electrolysis set up when acids or other agents attack the zinc which is one of the components of the brazing metal.

CORRESPONDENCE ON MECHANICAL SUBJECTS.

Weight of Electrical Apparatus.

(30)—Will you please tell me what is the lowest approximate weight of electrical appliances necessary to develop 80 to 100 horsepower for use in an aeroplane? What is the maximum amount of power obtainable from Vandervell's electric drive, which, I understand, was patented quite recently, and would it be applicable to aeronautic use? H. C. CLARK.

Somerville, Mass., Jan. 23.

It would be impossible to utilize electricity as a motive power for any form of aerial machine because of the heavy weight required. Thus, a motor of 50 horsepower would weigh more than 4000 pounds, while one of 150 would amount to over 11,000. This would simply transmit the electrical energy into rotary motion and would require a source of such energy. If batteries were counted upon that would add more weight than the motor itself. On the other hand, if a generator were figured upon as the source, this would require in addition an engine to drive it. The generator weight would be equal to that of the motor, while the engine would be about a tenth more. Since this is the basic condition, why resort to generator with its losses and the motor with its additional drawbacks, when the engine can be used directly and save this 8000 to 10,000 pounds?

The Vandervell drive referred to is for motor 'bus work, and probably has an efficiency in excess of 90 per cent. This is but a speed variator and requires both engine and generator.

Manifold Sizes and Carburetor Adjustments.

(31)—I desire the following information from a reliable source: What is the approximate outside diameter of exhaust pipes for various horsepowers and how is this figured? Also, the size of inlet manifolds? How may I obtain a correct adjustment of a carburetor for a wet and dry day? What must be changed and how much? R. L. McKee.

Providence, R. I., Jan. 14.

All pipe sizes are determined from the gas velocity, which is regulated in turn by the cubical capacity of the cylinders. There are distinct limits for both mixture and exhaust, these fixing the dimensions used. When the internal area has been figured in any case, it is only necessary to add the thinnest possible thickness of metal which may be obtained from the foundry. This is about .156 inch, and two walls would add twice that, or .312.

The exhaust limit is usually taken as 10,000 feet a minute, and for a carbureted mixture, it is considered that 6000 feet is the maximum. Suppose the engine is of 250 inches cubic capacity, and runs at 1000 revolutions a minute. This would give 2000 strokes, of which 500 were suction, and 500 exhaust. The amount of gas drawn in and then pumped out (not considering expansion) would be in a minute 500 times 250 or 125,000 cubic inches. This is approximately 100 cubic feet. If the limit be 10,000 feet a minute, this leaves a necessary area of but .01 square foot or 1.44 square inches. If the pipe be round, this is equal to a diameter of 1.35 inches. Similarly, with the inlet the limit of 6000 feet gives a section of .0166 feet or 2.39 inches, which is equal to a round form, 1.75 inches in diameter. When the thickness of metal is added, as previously pointed out, the outside sizes become, respectively, 1.66 and 2.06.

It should be mentioned that the exhaust is proportioned usually with the idea of each outflow of gas in one cylinder acting to create a vacuum for the products of combustion on the one next in firing order. With this in view, the sizes are often increased.

In damp weather, there is more moisture, and thus, proportionately less oxygen in the air. This is what is needed by the engine, hence the change should be such as to provide more. The fuel flow or needle setting is not changed, but the auxiliary air valve is set to open easily and thus at a lower speed. This will give the engine more air, and in that way, more oxygen, the greater quantity making up for the loss in quality. No other part of the carburetor should be touched. The same trouble is met in very high altitudes, and is compensated for in the same manner.

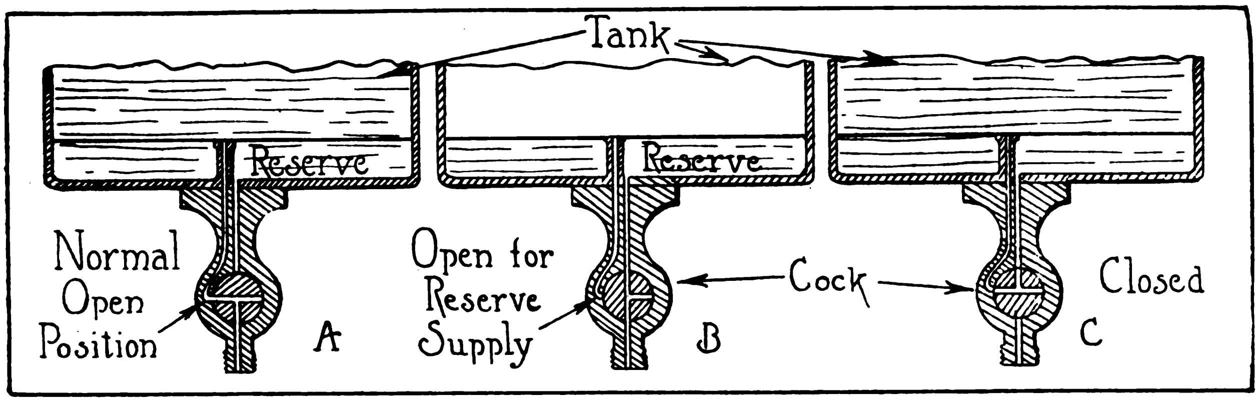

Fig. 1—Suggested Form of Gasoline Tank Reserve Arrangement with Three-Way Special Cock.

Constructing a Gasoline Cock.

(32)—Will you give me a few hints on making a cock for my gasoline tank which will be an improvement over the ordinary one-way form? I have an idea for drilling holes through the turning portion of mine so as to make it useful for other purposes; that is, by taking a two or three-way form, and drilling another hole down from the top, I thought that I could make a form of reserve out of the bottom of the tank, using the altered device with this in its two or three positions. I have heard somewhere, of a car fitted with a tank and cock of this type, and would like to make one. W. H. J. DALY.

Hoboken, N. J., Jan. 18.

It will not be possible to utilize the present cock, or the ordinary two-way form, but one can be made which will do just what this reader desires. In the accompanying sketch, this is shown in three sections, that at the left or A depicting the normal position. Here, the valve is open and the gasoline flows down the hole at the side of the cock and out into the system in a simple manner.

Granting that the supply has been exhausted, the handle is turned to the second position as outlined at B, in which the central opening is in communication with the part of the gasoline tank below the upper end, or the reserve fuel, to be exact. This flows straight through as will be noted.

At the right, C shows the third possible position, with the supply cut off. In this, a portion of the cock opening communicates with each hole, but with no outlet, hence there is no flow. In examining these sketches, it will be noted that a full half-turn will be needed from the A to the C position, regardless of the direction in which it is taken, while from B to C only a quarter twist is required.

This is the form used on a famous English car, but may be duplicated by any ambitious amateur with no other assistance than a pattern maker. Two patterns will be required, one for the body and the other to form the plug. In the average case, the lip at the top will be formed on the cock body rather than on the tank base. Little machine work will be required, other than the upper surface where the tank and cock meet, and the point where the plug turns in the body. A pattern once made for this device, a number could be constructed, and the extra ones sold to friends for enough to take care of the necessary labor.

Testing Out Carburetors.

(33)—Kindly give for my benefit some method of regulating and adjusting a carburetor float level out of the car. W. E. ORR.

Providence, R. I., Jan. 21.

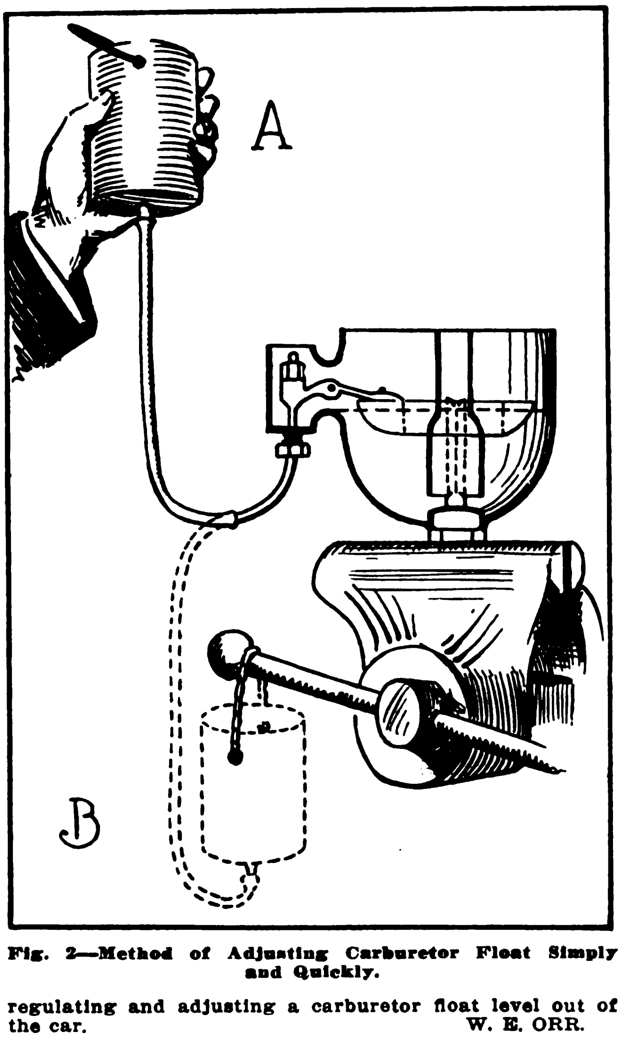

Fig. 2—Method of Adjusting Carburetor Float Simply and Quickly.

A suggestion is given in the accompanying sketch, which depicts the lower portion of the vaporizer, with cover removed, placed in a vise. A small pail or other object to hold about a quart of liquid is attached to the gasoline inlet connection by means of a rubber tube. By filling this with water, the position of it above or below the float will move the latter either up to its limit or downward as far as it can go. By removing the cover so the flow of water can be noted, and using the upper position indicated by the hand, and the lower one with the can hung on the vise handle as shown dotted, the amount of flow for the two levels can be ascertained and the position adjusted.

If the vise be attached to a work bench in the garage, it will be possible to build a shelf above it so as to answer for the upper level. This will permit the driver to get closer to the nozzle and float chamber, and thus, find out more about the action there.

Influence of Electric Lighting.

(34)—I am writing to find out if electric lights on a car lighted by magneto will injure it in any way. IRL SNHUTTS.

Bridgeport, Conn., Jan. 19.

Considering the car first, the extra current taken from the mechanical generator will not injure it in any way, and is said to have little noticeable effect upon the ignition. The sole question to arise is one of quantity; that is, does the device generate sufficient current to maintain both ignition and lighting systems? From the experiences of a number of motorists with this machine, it would appear that it does. There remains the question as to whether this system produces the right amount at the desired time.

In slowing down to turn a sharp corner in the road, the motor revolutions drop so low that the current generated is not sufficient for the lights, which have a very limited range, and consequently when one is turning a dangerous corner slowly and needs light most, it fails. The remedy is the connection of a storage battery floated on the line so that the excess will charge this, and it will then remain ready.

Fuel Consumption.

(35)—Will you kindly publish in the columns of your valuable Journal the amount of gasoline used for a one horsepower motor an hour, also how you would figure to obtain the result? I have had the question asked me many times, and according to my figuring on different sized cylinders, my figures do not agree L. N. WALTER.

Montello, Mass., Feb. 5.

The amount of fuel consumed by an internal combustion motor will depend upon a number of conditions, such as bore and stroke, number of cylinders, carburetor, work performed, etc. It is obvious that a cylinder having a five-inch bore and stroke will consume more fuel than one with a bore and stroke of three inches, all other conditions being equal. Different fuel results may be obtained with two similar engines fitted with different carburetors. There are so many conditions entering into the question that the figures obtained would only be satisfactory when two motors were tested in the same service.

The amount of fuel consumed, however, may be obtained by measurement, a practise common with motorists and others. The fuel container should be emptied, a gallon of gasoline poured in, a stick inserted, and the height of the liquid noted and marked upon the rule. The balance of the fuel may be poured a gallon at a time or in less quantities, the amount depending upon how fine the measure is to be calibrated. After running the motor for a stated period, the tank may be measured, the amount of fuel consumed noted easily and computations made accordingly.

Cracked Cylinders.

(36)—Being one of your subscribers I would like to inquire if you can inform me if the ——— car is being manufactured, and if so where? I have a 1907 model, touring car, the motor of which I think is a ———. One cylinder is cracked. I wish to repair it as I am going to sell the machine. G. W. JEPSON.

Melrose, Mass., Feb. 3.

The automobile referred to has not been marketed for some time although it is stated that steps are under way for a reorganization of the company. The address of the concern was Charlotte, Wis.

Regarding the motor, you could have it identified by some repair man or person familiar with the make, or write to the company you mention whose address is Muskegon, Mich., explaining the circumstances and giving the model of the car. The damaged cylinder may be repaired by autogenous welding process, this depending upon the nature of the fracture.

Adjustment of Tappets.

(37)—I have a model ——— car and the adjustment of the intermediate tappets works loose. I have set the lock nut up as tight as possible, but it works loose just the same. The power of the motor is considerably affected as there is too much play between the tappet and valve stem. Is there any way I can remedy the trouble as I do not wish to go to the expense of new members? The car was not new when I purchased it.

WILLIAM FORDHAM.

Bridgeport, Conn., Feb. 4.

The best repair would be to purchase and install new members. The old parts have worn through careless locking by the former owner and it would involve considerable machine work to make them satisfactory. A simple method of obtaining results with the old tappets is to unloosen the check nut and remove the tappet proper. As the locking member is recessed, the tappet should be screwed down snugly as far as it will go and the nut locked securely. Then take a piece of round steel, the same diameter as that of opening in pushrod, and cut off a number of different sized discs. Insert one or more as may be necessary to offset the space lost by screwing down the tappet. An accurate adjustment may be obtained by filing the disc if too thick and it is advisable to make the latter a trifle longer than necessary to permit of fitting. The discs may also be hardened to prevent wear.

Another method is to utilize fibre. Cut a number of discs, slightly smaller than the opening, and hammer them as hard as possible, this being done to improve their wearing qualities. The fibre has an additional advantage as it will be quieter than the metal members. The writer effected a repair to a motor of the same make by making solid tappets, and after fitting them hardening the ends. In adjusting the parts it is advisable to time the opening and closing of the valves by the marks on the flywheel, rather than by measuring by a visiting card, etc.

Charging Battery with Cells.

(38)—I read an article in a magazine describing how to charge storage batteries with electricity of the house or garage. Not having electric lights, can you inform me of a method of charging a battery without using a dynamo or house current? F. A. CARLTON.

Jacksonville, Fla., Feb. 2.

A storage battery, such as is employed for ignition purposes, may be charged with primary batteries as illustrated in the accompanying sketch. When using this system an ammeter should be incorporated in the circuit, and the zincs of the batteries let down into the solution just so far that the required number of amperes is indicated by the instrument. Instead of raising or lowering the zincs a small resistance may be introduced in the circuit, such as lamps, but as these would consume current, the other method is preferable. The number of cells employed will depend upon their type, but this may be determined by experimentation.

Adjusting Brakes.

(39)—Can you inform me why it is that the brakes on my ——— car do not hold equally? I have taken up the rods evenly on both sides, but the right hand brake does not hold as well as the other. Is there any way to adjust the members so that they will grip the same? The linings appear to be good as I have had the wheels off and examined the former.

W. S. GOODCHILD.

Cleveland, O., Feb. 5.

The reason the brakes do not grip evenly is because of the adjustment of the rods. It is a difficult matter to set the latter so that both members act the same owing to the design which is not being employed in modern motor car construction. If an equalizer, that is, a device for distributing the pressure applied, were utilized, the trouble would be overcome.

An excellent method of adjusting brakes is to jack up both rear wheels clear of the ground. Then release brake pedal and disconnect turnbuckles. Next shorten each rod a little, and move it forward and note if the brake begins to grip when the end of the rod is in a position for attaching to its holding member. Then set the brake pedal a trifle and try each wheel, noting if one grips more than the other. By shortening or lengthening the rod of the member which allows the wheel to move easier or harder than the other, the brakes may be equalized. Next apply more pressure and try both wheels, making further adjustment for pressure if necessary, but in the operation take the same number of turns with each turnbuckle.

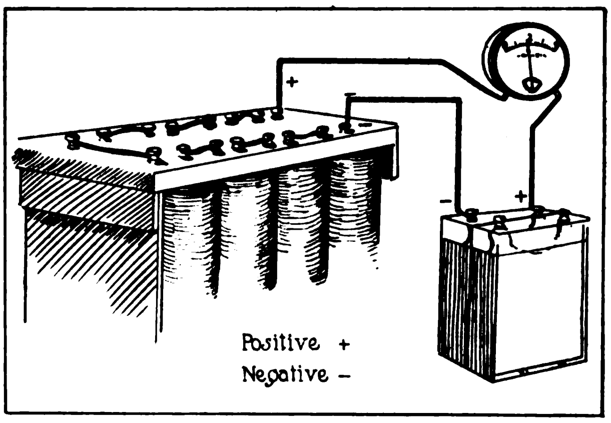
Charging Ignition Batteries.

(40)—Please publish in your columns when convenient, a description of some efficient arrangement if there be any, to charge storage batteries for ignition purposes by windmill power. I have heard that there are some successful plants of this sort in operation.

W. H. B. JACOBS.

Omaha, Neb., Feb. 1.

While the energy of a windmill might be utilized to operate a dynamo for generating a current to charge storage batteries, the writer has never seen one in practise. The variable speed of the mill would have to be regulated by fitting a governor to the current generator. In charging batteries it is essential that the flow of current be of a stated amperage, this depending upon its construction. This rate should be maintained evenly to obtain satisfactory results. Perhaps some reader has experimented with the system mentioned and will present the results obtained.



Charging Ignition Storage Battery with Primary Cells.

Starting Two-Cycle Motor.

(41)—Being a reader of your magazine I take the liberty of inquiring about a two-cycle engine which is not utilized in connection with automobiles but for sawing wood. I have used the engine for some little time with good success, but lately it is difficult to start and I have to change the mixture, giving it a richer one in starting than formerly. It is not because of cold weather as I have tested this out. It is a two-port motor and was used some time before I got it. I have tried all the things I can think of, but the trouble continues. Can you give me any suggestion as to the cause?

W. Z. CARTER.

Westerly, R. I., Feb. 7.

The description would indicate that the difficulty experienced in starting was due to a leak in the crankcase, either around the bearings or in the crankcase proper. The writer knows of an instance where a tiny blowhole in the casting, which was covered with paint, caused starting troubles after the paint wore away. This was detected by turning the flywheel until the piston was compressing the charge when a slight hissing noise was heard and traced to the hole in question. This was sealed and the motor gave excellent service thereafter. A leak of such a nature will affect the operation of a two-cycle motor, especially in starting.

Coil Gives Trouble.

(42)—I have a ——— car and have experienced considerable trouble with my coil. I have been advised to install a K-W master vibrator as the repair man claimed it would eliminate my troubles. Will you please give me your opinion as to the merits of the same?

C. T. EVANS.

Hartford, Conn., Feb. 3.

A master vibrator would improve the running of your motor and as the repair man states, prevent a repetition of your troubles. The K-W device is employed on many cars and has proven very satisfactory in practise.

Bore and Stroke Motor.

(43)—What is the proper allowance to make for stroke in figuring motor power? For instance: Which should develop most power, other things being equal, a 3.25-inch bore and five-inch stroke four-cylinder motor or one having a 3.75-inch bore and four-inch stroke?

F. B. STUDWELL.

Lake Waccabuc, N. Y., Jan. 26.

It depends largely on what is desired of the motor. In order to give a definite answer it would be necessary to learn exactly in what service the engine is to be used. However, the following suggestions may prove of value:

Taking it for granted that all other conditions are equal the efficiency of work performed with a gallon of fuel will not be the same at all times. Some engineers claim that the power attained does not increase continually in proportion to the increase in the length of the stroke, but only to a point where the rate is about 1.6 to one. This means that the energy in the charge with the growing stroke is not as efficient as at the beginning. As the burning of the charge may be said to be practically the same by a long or short stroke, a difference in power of the short stroke motor would be said to originate in proportionate loss of heat by the overlong stroke motor.

There is, however, a difference of opinion among authorities concerning this point, especially when there is but little variation in the length of the stroke of the two motors. Some contend that as the charging surface of the cylinder with a short stroke motor in comparison to the total gas contents is less than in the long stroke engine, the consequence is that there is a relatively less loss of heat in the first mentioned.

Others hold that the principal distribution of the heat takes place at the moment of the explosion and therefore claim in respect to the heat losses that only the surface measurements of the compression chamber at that time may be considered, which, of course, favors the long stroke.

The facts appear that as far as the motors are concerned the efficiency is the same in both types, provided, of course, that the proportions are normal. To obtain full value of the expansion a certain piston speed is necessary, thus giving the short stroke motor more revolutions than the longer stroke. Therefore, before selecting the engine it is well to know the work required of it. For light cars where high speed is desired, the short stroke generally gives satisfaction, but on heavier machines the slow speed motor has many points which may well be recommended.

According to the formula of the Society of Automobile Engineers, the motors described would be rated as follows:

Three and one-quarter-inch bore and five-inch stroke, 17 horsepower; 3.75-inch bore and four-inch stroke, 22.5 horsepower. These calculations are based upon an assumed piston speed of 1000 feet a minute.

Excessive Lubrication.

(44)—I have been troubled with over lubrication in a ——— car. The No. 1 and No. 2 cylinders are at fault as the exhaust valves have to be cleaned about every 350 or 400 miles and the combustion chambers are always soaked with oil. The first cylinder gives more trouble than the second. The others work properly. This fault developed after the car had been run about 1000 miles.

The lubrication is by the constant level splash with circulating pump. The oil splashers or dip pans were dipping .25 inch. I shortened these to .1875 inch, as advised by the maker of the car. It stated it were of the opinion that the pistons were too small. I have shortened the splashers to .125 inch in the No. 1 cylinder and to .15625 inch in the No. 2. This has not helped any as I can see. I have the motor disassembled but the pistons and cylinders do not show any wear.

There are four .5-inch holes through each piston about 2.5 inches from the open end. I suppose these are for lubrication. Do you think it would help this trouble if I stopped up these openings in the troublesome cylinders? Would there be any danger of these cylinders not getting enough oil? If I stopped up the openings would it be necessary to cut grooves on the piston as suggested in an article appearing in your magazine some time ago?

GEORGE DOTTS.

Eddyville, Ia., Jan. 27.

The closing of the openings of the pistons should not be attempted unless recommended by the maker who should be able to help remedy the trouble. It may be that the pistons and rings do not fit properly as the maker suggests. It is possible that the front springs have settled and that the front part of the crankcase is lower so that oil gathers, creating an over supply. If the crankcase be not fitted with partitions this may be the trouble.

Holding Brass Pipe in a Vise—When cutting threads on brass pipe it is often desirable not to scratch or bruise the surface. The mechanic usually makes jaws by taking two pieces of wood and boring a hole on the line where they are joined together. The pipe is then placed between the jaws in the half round holes and clamped tightly in the vise, which will not always hold securely when using the die. A little powdered resin applied to the half round recesses in the wood will grip the pipe sufficiently for the work.

When Horn Reed Is Deformed—Take a stout pin and introduce it transversely beneath the reed pushing it back as far as possible. Then with a pliers bend down and straighten the reed until it is about in its original position all along the tongue. Replacing the reed in the tube and testing from time to time will assist in determining the proper degree of straightening necessary. If a particle of dirt has lodged underneath the reed in a horn, causing the horn to become mute, it can generally be dislodged by tapping the reed tube and operating the bulb at the same time.

Sawing Thin Bars—Those who have had the job of cutting thin brass or copper tubing with the hacksaw are acquainted with the difficulty usually encountered as a result of the tendency on the part of the saw to bite into the walls of the thin tubing. This difficulty can be easily overcome. An old hacksaw blade, which has outlived its usefulness, is all that is necessary, and therefore the method is one that fits in well with shop economy. The teeth of the blade are first ground down with an emery wheel until only very small teeth projections remain.

To Clean Brass Articles—Take six large spoonfuls of cider vinegar and two spoonfuls of salt, and put in a bottle and keep ready for use. Apply with a small cloth, rubbing well. All stains will disappear and the brass will be as bright as when new. Wash the vinegar off after polishing, and dry the brass, as it will become discolored if left on.

When sawing across the grain in very hard wood, like lignum-vitae, thoroughly seasoned oak, or hickory that is very hard, the ordinary rip saw will cut very much faster and better than the cross-cut saw, which is the only thing that will work satisfactorily on the soft woods.

WHO'S WHO IN THE INDUSTRY.

RADFORD TO MANAGE CARTERCAR INTERESTS.

Harry R. Radford, who for several years has held the position of general sales manager for the Cartercar Company, Pontiac, Mich., now assumes the management of all Cartercar interests, except the manufacturing department. This change follows the recent resignation of R. A. Palmer as general manager of the company. The latter was one of the original organizers, but other business interests compelled him to relinquish his position.

Although considerable speculation took place when it became known that Mr. Palmer was leaving, as to who would succeed to the general managership President Thomas Neal of the General Motors Company, of which the Cartercar company is a part, announced that it had been decided upon to dispense with the position.

Harry R. Radford, Manager Cartercar Company.

This will bring under Mr. Radford's supervision the departments of advertising, selling, credit of agents and the directing of the seven branches in New York City, Philadelphia, Detroit, Chicago, Kansas City, Los Angeles and San Francisco. The management of the factory will be under the direction of the production manager.

GRIFFITH SECURES PROMOTION.

Harry W. Griffith, General Manager Remy Electric Company.

Harry W. Griffith of Indianapolis, Ind., who has been secretary-treasurer of the Remy Electric Company, Anderson, Ind., well known maker of ignition specialties, since Stoughton A. Fletcher bought the plant some months ago, has been appointed general manager of the company, vice W. R. Poland, resigned. Mr. Griffith has had a long experience in the manufacturing business, having been connected with the American Creasoting Company of Chicago before joining the Remy concern. His many friends in the automobile industry will be pleased to learn of his promotion to his new position, one which he is duly qualified to fill with success. The change became effective Jan. 18.

Mr. Poland has organized the Simplex Manufacturing Company, to produce and market a new mechanical self-starter for automobiles, and has disposed of his interest in the Remy Electric Company. Associated with him will be W. S. Poling, G J. Derthick and James Stanley of Anderson.

BELIEVES IN INDIANA PRODUCTS.

H. C. Lathrop, secretary and treasurer of the Henderson Motor Sales Company, Indianapolis, Ind., distributor for Cole cars, whose photograph is presented herewith, believes that every automobile manufactured in the State of Indiana should be represented in Indianapolis. He believes that this city holds the same relation to the automobile industry in Indiana as Detroit in Michigan, and that it will not be long before the capital of the Hoosier state will have as strong prestige in the country as the Michigan city.

"Out of the 64 pleasure and commercial gasoline vehicles and electrics manufactured in the Hoosier state but 25 have representatives in Indianapolis," says Mr. Lathrop. "The manufacturers who are represented here get the brunt of the business as a result. I firmly believe Indiana makers should have offices in the largest city in the state.

"Just look how automobile row is growing in this city. Through the efforts of Carl Fisher, North Capitol avenue, one of the fashionable streets, is being built up into an automobile district. Indiana has more car factories than any state in the Union and there is no reason why the statisticians at Washington in 1913 should not find the number of cars manufactured in this state are up to a much higher figure than recently announced."

H. C. Lathrop, Secretary Henderson Motor Sales Company.

Among the recent firms who are now in new quarters or who will shortly move into new places of business are the makers of the De Tamble, Richmond, Westcott and Haynes cars, Firestone and Diamond tires, Stromberg carburetors and Stewart speedometers. A new building is being erected for the service department to be maintained by the Henderson Motor Sales Company.

B. Frank Blaney, for two years sales manager of the Johnson Service Company, Milwaukee, Wis., is now sales manager of the Havers Motor Car Company, Port Huron, Mich., and is making agencies in the eastern states.

The American Rim Company has established offices and salesrooms at 250 West 54 street, New York, N. Y., and has organized a vigorous campaign for marketing Lambert demountable rims.

THE ACCESSORY -AND- GARAGE JOURNAL
Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. I. NO. 4.

AUTOMOBILE JOURNAL PUBLISHING CO.
Times Building, Pawtucket, R. I.
Publisher of
THE AUTOMOBILE JOURNAL THE MOTOR TRUCK
William H. Black, Treasurer. D. O. Black, Jr., Secretary.

EDITORIAL DEPARTMENT:
WILLIAM W. SCOTT. CARL A. FRENCH.
C. P. SHATTUCK.

ADVERTISING DEPARTMENT:
NEW YORK—W. R. Blodgett, 25 West 42nd St.
DETROIT—C. A. Eldredge, 304 Sun Building.
CHICAGO—P. G. Lurian, 1405 Clifton Avenue.
BOSTON—John W. Queen, 6 Beacon Street.

PUBLISHED THE 15TH OF EACH MONTH.

SUBSCRIPTIONS:
The United States and Mexico, the year, **$1 in advance;** Canada and Foreign Countries in Postal Union, the year, **$2 in advance. Fifteen cents** the copy.

CONTRIBUTIONS:
Anonymous communications not considered. Correspondence on subjects relating to the motor industry and the trade will receive attention. Stamps must be enclosed to insure return of unsolicited contributions.

ADVERTISING:
Information supplied at request.
Advertising Copy for the ACCESSORY and GARAGE JOURNAL requiring submission of proof must be received by 5th of month to insure publication in issue of the 15th of month.
Advertising Copy, proof not required, accepted to morning of the day before publishing day (unless such day is Sunday or holiday, when previous day is limit) of each publication.
Remittances should be made by Check, Draft, Postoffice or Express Money Order, or Registered Letter. Money enclosures must be at sender's risk.

PRESERVING TRADE INFORMATION.

One of the most valuable adjuncts to an accessory and supply business is the trade information instantly available, for many requests are made by customers who have but vague knowledge of what they desire to examine or obtain. This means with the well ordered concern a systematized reference that can be consulted instantly and which is kept up to date. Perhaps the better method is a file of catalogues and another of the circulars and booklets that are received from time to time, each of which should be arranged alphabetically at least, and where it is possible each article should be kept separately. The time required for classification of the information may be regarded as prohibitive by some, yet the saving is great when one considers how many individuals make inquiry during a year. It may be well enough to have a house cleaning occasionally, which will permit a restoration of the papers that have been misplaced and restore the files to the height of efficiency. The literature sent out by the manufacturers and jobbers is for the benefit of the trade and the possible customers. It is useful to the valuation placed upon it by the business man, and were there realization of the possible saving of time and the better serving of the patrons it is very probable there would be one or more complete files in each store or office.

ADVISING THE CUSTOMER.

Business men are often asked by customers to advise them, and the subjects are as numerous as the patrons. The man who conducts a garage and has a mechanical knowledge born of experience ought to be versed in principles, if not in practise, but the individual who maintains a store cannot be expected to have the knowledge as dependable as that to be obtained from the practical man. It is certain enough that the dealer ought to know of proportions, dimensions, capacities, etc., but with a matter of 200 diffent makes of cars and 150 makes of service wagons now produced, to say nothing of types existing but no longer manufactured, it is somewhat discouraging to reflect upon the possible demands that might be made upon a motor vehicle Solomon. And in addition to all this there is the prospect of request for information relative to several thousand different articles of equipment and supply. The man who will select the best of each line from the varying products must either be exceedingly well informed or surprisingly ignorant.

VALUE OF THE STOCK DISPLAY.

Those who have the opportunity for the display of stock should make the most of every article that is received. The manner of showing is entirely a matter of judgment and must depend upon the facilities for exhibition, but with goods having both constant and seasonable sale it is possible to make frequent changes and to exhibit a wide diversity of stock. One need merely recall his own experience with another's exhibit to realize that arrangement is a very potent factor, and to understand that progression or stagnation is often evidenced to the public without more than a glance while in passing. Moreover, it is very human to want the new and the improved, and these qualities are not sought where there is little or no activity. This fact obtains the world over and rarely is exception made. It should be remembered that demonstrations of service and efficiency are always valuable and that these can be made from time to time with admirable results.

WHAT CONSTITUTES SALESMANSHIP.

The salesman who understands selling always finds that his most valuable asset is his knowledge of the market so far as the products he is handling are concerned. This does not mean that it is necessary to discredit another line, but it is only by knowing the exact qualities of the articles that he is able to inform the customer of them and to advise whether or not they will meet requirements. It will be seen that this means keeping pace with at least all standard productions, where they are used as regular equipment, and where they have been utilized. The explanation by a careful salesman of an instrument or device is often necessary to satisfy a customer that it is what he desires, and unless he is capable of doing this when desirable the clerk is not alive to his own usefulness and his employer's business interests.

UP-TO-DATE ELECTRIC GARAGING.

As a pioneer in the electric vehicle garage business I have learned many things that experience only can teach. I am glad to offer some suggestions which, if followed, will prove of mutual profit and benefit to both the garage owner and the customer.

The prevailing custom is to give a service, which includes calling for and delivering the car once a day, storing, washing, charging and general care, such as brake adjustments, tire inflation and oiling, for which they pay a fixed monthly charge.

In the one instance an owner will get his car early and use it late, requiring a full charge each night and a thorough cleaning. In another instance an owner will use his car but a few hours each day. It is easily cleaned and but little current put in.

In either instance cited the operator knows he or she can drive carefully, avoid mud holes and be saving of current, or be as careless and extravagant of current as one chooses. It costs the owner just so much anyway. It is a fact that with one the garage loses money, and with the other makes some. The average is satisfactory. But under this arrangement we are penalizing the careful driver by making him pay for the other driver's indifference. This is wrong. Anything that will make a driver avoid a mud hole or cause him to handle his car more carefully is a good thing for the owner, the car and the business. My plan gives a man what he pays for and he pays for what he gets.

When a customer 'phones for his car, a tag is filled out. It gives the owner's name and address, states the time he 'phoned and gives the time and place for delivery. This tag is placed on the call board where the call boy finds it and when he starts to deliver he takes the tag, stamps it under the time clock, puts in his pocket, delivers the car and returns, stamps the card again with his initials between the stamps, and the customer is charged accordingly.

The same method is employed in calling for the car, excepting that person receiving the message in addition to getting the time and place for calling also notes on the tag any instructions the owner wishes to leave regarding the car. When the machine is brought in the tag is left in the car. The floorman notes this tag and if the car is to be washed it is sent to the rack where the washer again stamps the tag before he starts in and after he is finished.

This stamping of the tag applies to all work that is done on the car by whoever happens to do it, and insures an exact record of just what is done, when it was done and by whom. These tags, when filed away, are not only a complete record of the car itself but enables one to keep an accurate check on every employee's time.

Storage, of course, is handled at a flat rate per month. The current is sold by the charge or kilowatt.

This system may need modifying to adapt itself to different local conditions, but the principle is right. It encourages careful and economical operation of the car and there is never any misunderstanding or complaints about the bill when it comes in, and the garage man knows he is being paid for what he does and there is no idle time for which either he or his customer pays.

R. H. MORRIS,
Manager, Electric Vehicle Department, Pioneer Automobile Company, San Francisco, Cal.

MILLER MOTORING EYCYCLOPEDIA.

One of the most striking illustrations of the proportions of the motor vehicle industry and those allied with it is the catalogue of Charles E. Miller, than whom there is no better known firm in the world. The name of Miller is synonymous of motoring, as it was of bicycling in the halcyon days of the silent steed, a condition that must obtain when it is known that no less than 15 separate stores are conducted under this name. And in addition more than 100,000 catalogues with more than 250 pages are distributed to all parts of the globe.

The Miller catalogue is compiled annually. It is the largest and most complete reference published and notes, pictures and describes every part, accessory and supply that is handled by Miller. Miller does not deal in motor vehicles, but it is possible to buy any part of one that may be needed for replacement or restoration, and any part of any equipment that may be desired. It is possible to order a new engine, a new transmission, a new axle, a new top, a garage outfit, a repair shop installation, a fuel station system, or, in fact, anything that is wanted for any particular service, as well as special machinery.

The detail of the innumerable subjects entering into the Miller stock is told of in the catalogue, as well as the prices, so that those who have the book may use it at all times for a reference for proportions, sizes, etc., a quality of much value. The products of the best of Europe's makers are carried by Miller besides everything that America produces. The lubricant division of the business is really a distinct enterprise in itself, this distributing the Pan-American oils and greases.

Miller is the sole distributor for many devices and appliances that are widely utilized and are especially serviceable. He is frequently consulted by those who are about to engage in production of a new article and desire the advice of a man whose judgment of marketing possibilities is regarded as safe. Miller is the biggest buyer in the United States, for he not only has his own distribution to other dealers to provide for, but he has his own retail stores. Miller imports and he exports, and he manufactures. He has as a whole the largest automobile supply house in America and besides the motor car he can equally well supply the needs of the motor yachtsman, the motorcyclist and the aviator.

Miller's main office is 97-103 Reade street, New York City, and there are two branches in Manhattan and one in Brooklyn. Besides these there are stores and distributing stations in Boston, Philadelphia, Cleveland, Detroit, Buffalo, New Orleans, Albany, Newark, N. J., Springfield, Mass., Hartford, Conn., and Atlanta.

The Miller catalogue is worth studying. It contains more real information for those for whose benefit it has been published than any other work one might instance. It is a big catalogue, but in proportions it is representative of the business it describes. It might well be designated as Miller's motoring encyclopedia.

WILL BUILD COLBY TRUCKS.

The Colby Motor Company, Mason City, Ia., has passed into the hands of men who propose to enlarge its activities. The new officers are: President, J. E. Burmeister; vice president, W. M. Colby; treasurer, H. S. Murphy; secretary, W. N. Smith; general manager, D. W. Henry. Mr. Colby was executive of the original company. The new men are largely interested in the National Farm Machinery & Implement Company, which has a capital of $5,000,000. The company will continue to produce its line of pleasure cars, but will also engage in the manufacture of service wagons and trucks.

The Winton Motor Carriage Company has established a factory branch at Spokane, Wash.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS

The following concerns have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

Hercules Tire Company, New Orleans, La.; capital, $50,000; incorporators, Dr. J. M. Underwood, president; Sim J. Connell, vice president; Walter J. Manion, secretary; Martin H. Manion, treasurer; Leslie Dunn, manager.

La Salle Auto Oil Company, Chicago; capital, $25,000; incorporators, W. R. Watson, G. W. Curtis, L. E. Powell.

Hubbard Motor Car Company, Clio, S. C.; capital, $3000; incorporators, J. L. Hubbard, Hugh McLaurin.

The Direct Drive Gear Company, Paterson, N. J.; capital, $500,000; president, Henry C. McBrair; vice president, Charles D. Cooke; treasurer, C. A. Isleib; secretary, David G. Rogers; general manager, C. E. Garrabrant.

Overland Sales Company, Petersburg, Va.; capital, $15,000; incorporators, J. T. Burgess, president; D. P. Weeks, vice president; D. H. Burgess, secretary and treasurer.

Noble S. Bruce Auto Company, Shelby County, Tenn., increase of capital stock from $10,000 to $50,000. The incorporators are: J. W. Bruce, C. E. Boloate, Noble S. Bruce, John S. Parker and C. H. Thomas.

Land S. International Airless Tire Company, Camden, N. J.; capital, $100,000; incorporators, J. H. Nixon, Irving Zimmerman, Thomas B. Hall.

Michigan Auto Joint Company, Grand Rapids, Mich.; capital, $10,000; incorporators, Charles E. Perkins, J. F. Carter, F. S. Perkins.

White, Binford & Robinson Motor Company, Boston; capital, $20,000; incorporators, Albert C. White, Jr., president; Cecil P. Robinson, treasurer; Henry O. Cushman.

Lakeaero Company, Augusta, Me.; capital, $1,000,000; incorporators, E. J. Pike, president; L. J. Coleman, treasurer; C. L. Andrews, clerk.

United Automobile Owners' Protective Association, New York City; capital, $25,000; incorporators, H. E. Troid, H. A. Trebing, A. J. Davenport.

International Motor Service Association, New York City; capital, $100,000; incorporators, W. H. Brealey, W. W. Friend, I. A. Monsees.

The Dayton & Troy Automobile Company, Dayton, O.; capital, $10,000; incorporators, C. E. Emrick, S. S. Faulkner, W. J. Sherer.

Etheredge Motor Company, Columbia, S. C.; capital, $10,000; incorporators, E. J. and C. L. Etheredge, R. L. Mitchell.

Cavac Motor Car Company, Wilmington, Del.; capital, $500,000; incorporators, Claude L. Roth, Charles A. Verschow, John W. Brady.

William Marshall, Inc., White Plains, N. Y.; capital, $20,000; incorporators, William Marshall, Marguerite Young, John Hamilton.

The Shaw-Lundin Auto Company, Kittery, Me.; capital, $10,000; incorporators, Burton W. Shaw, Newton Center, Mass.; Thomas F. Malone, Horace Mitchell.

Vera Motor Car Company, Boston; capital, $100,000; incorporators, G. M. Poland, president, Wakefield, Mass.; M. A. Sweeney, treasurer.

Chalmers Memphis Company, Memphis, Tenn.; capital, $5000; incorporators, H. C. Luckett, J. M. Stoeckle, P. W. Lytle, F. J. Rambler, W. P. Biggs.

McClurg Tire & Rubber Company, Boston; capital, $12,000; president, John E. Horne; treasurer, Kirke L. Moses, 103 Massachusetts ave., Boston; John S. McClung.

Imperial Auto Sales Company, Madison, Wis.; capital, $10,000; incorporators, Arthur F. Teigs, Mrs. Arthur F. Tiegs, Joseph E. Farber, Mrs. Joseph E. Farber.

Hydraulic Motor Vehicle Company, Milwaukee, Wis.; capital, $15,000; incorporators, Calvin Stewart, August Baltzer, W. M. Stewart, W. E. Brown.

Seymour Auto Company, Seymour, Conn.; capital, $4000; incorporators, Ernest S. Clark, Thomas S. Coleman, Edward F. Coleman.

Penoa Motor Oil Company, Los Angeles, Cal.; capital, $25,000; incorporators, J. P. Smith, Joseph A. G. Brown, M. B. Armstrong.

The Capital City Automobile Company, Austin, Tex.; capital, $35,000; incorporators, Pierre Bremond, W. M. Graham, Howell J. Grinnan, R. M. Thomson, Jr.

Rowe Motor Manufacturing Company, Camden, N. J.; capital, $500,000; incorporators, Charles Def, Marion Lambert, Florence M. Caskill, 104 Market street, Camden.

The Standard Motor Car Company, Tulsa, Okla; capital, $5000; incorporators, W. L. Walker, William S. Baker, Clarence B. Sexton.

Amerital Manufacturing Company, New York City; capital, $200,000; incorporators, W. O. Turrell, S. Seognamillo, L. W. Schwarz.

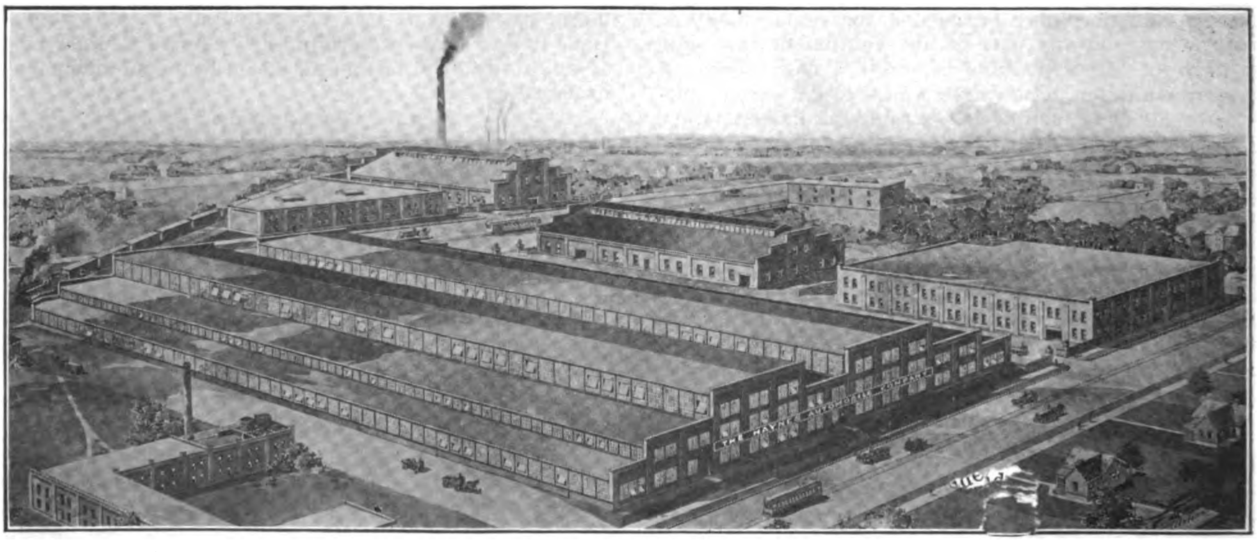
United States Co-Operative Automobile League, Cambridge, Mass.; capital, $250,000; incorporators, George F. Mings and others.

Delamater-Byrnes Automobile Company, 10 West 60th street, New York City; capital, $30,000; incorporators, J. D. Delamater, M. B. Byrnes, W. A. Shepard.

Bicknell Auto Company, Bicknell, Ind.; capital, $15,000; incorporators, E. T. Hollingsworth, S. S. Hollingsworth, J. A. Keith, H. A. Murray, John Carrico, Robert McClure, W. V. Gates.

Randolph Motor Truck Company of Delaware, New York City; capital, $200,000; incorporators, H. O. Coughlin, Welcome W. Bender.

Bernhard & Turner Automobile Company, Des Moines, Ia.; capital, $60,000; president and treasurer, J. C. Bernhard; vice president and secretary, Jay E. Turner.



Factory of Haynes Automobile Company at Kokomo, Ind., the Six Buildings of Which Provide a Floor Space of 400,000 Square Feet.

Oakland Auto Company, Richmond, Va.; capital, $15,000; president, R. H. Bruce; vice president, S. V. Gregory; secretary, G. T. Sharp.

Patton Aeroplane Company, Montgomery, Ala.; capital, $60,000; incorporators, Moses F. Patton, John L. Tyler, Hugo F. Budermann.

Interstate Tire & Rubber Company, New York City; capital, $500,000; incorporators, R. H. Falbaum, M. A. Gentry, L. R. Strauss, I. H. Falbaum, Atlanta, Ga.

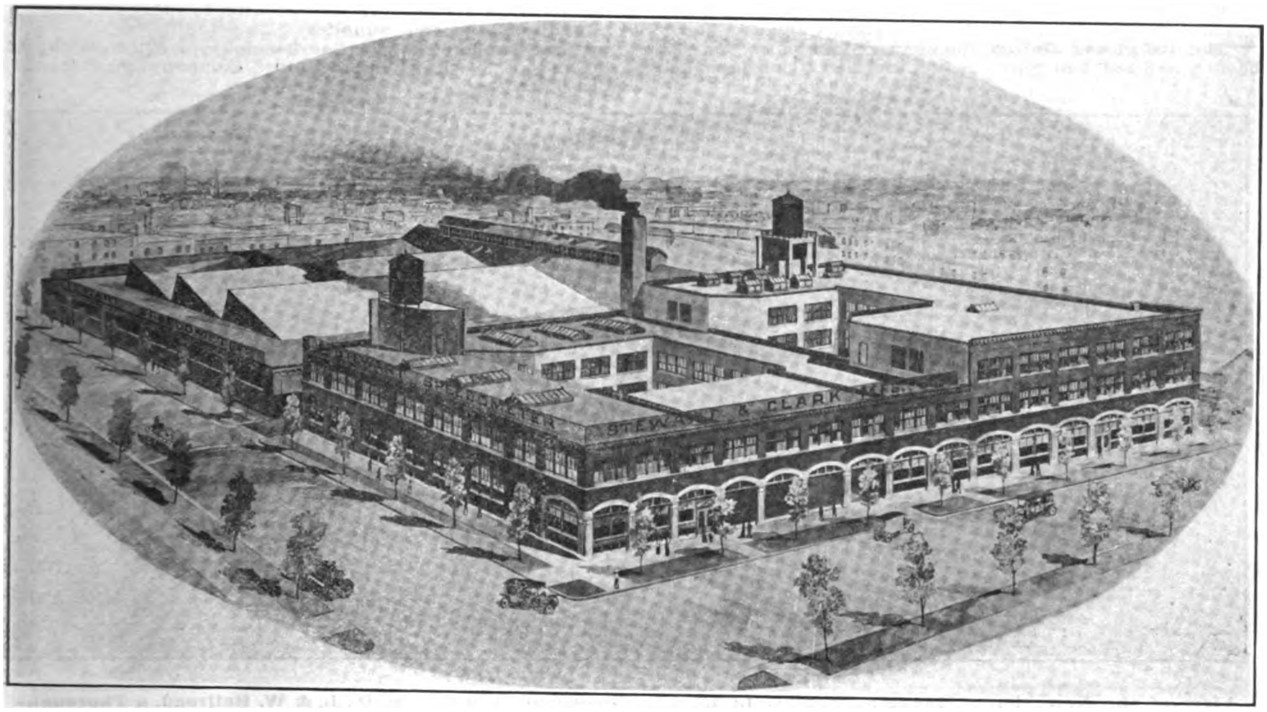
GARAGE & DEALER

Ralph F. Coburn has been placed in charge of the Stoddard-Dayton Sales Company, with headquarters at 94 Massachusetts avenue, Boston.

Leslie P. Bucklin has been appointed general manager of the Fred E. Gilbert Company, Jacksonville, Fla., to succeed John E. Kay. Bucklin was formerly connected with the Florida Times-Union.

Edward Baden, Independence, Kan., has leased the Schoenfeldt building and after extensive alterations will open a first class garage. He represents the Overland, made by the Willys-Overland Company, Toledo, O.

A. H. Stephens and Wilbur Johnson have taken charge of the Viertel garage, Main street, Booneville, Mo., and will make extensive alterations, including the fitting of a machine shop. The firm will include tire repairing among its departments.



Extensive Plant of the Stewart & Clark Manufacturing Company, Chicago, Well Known Maker of Speedometers, to Which a New Building Was Added Recently.

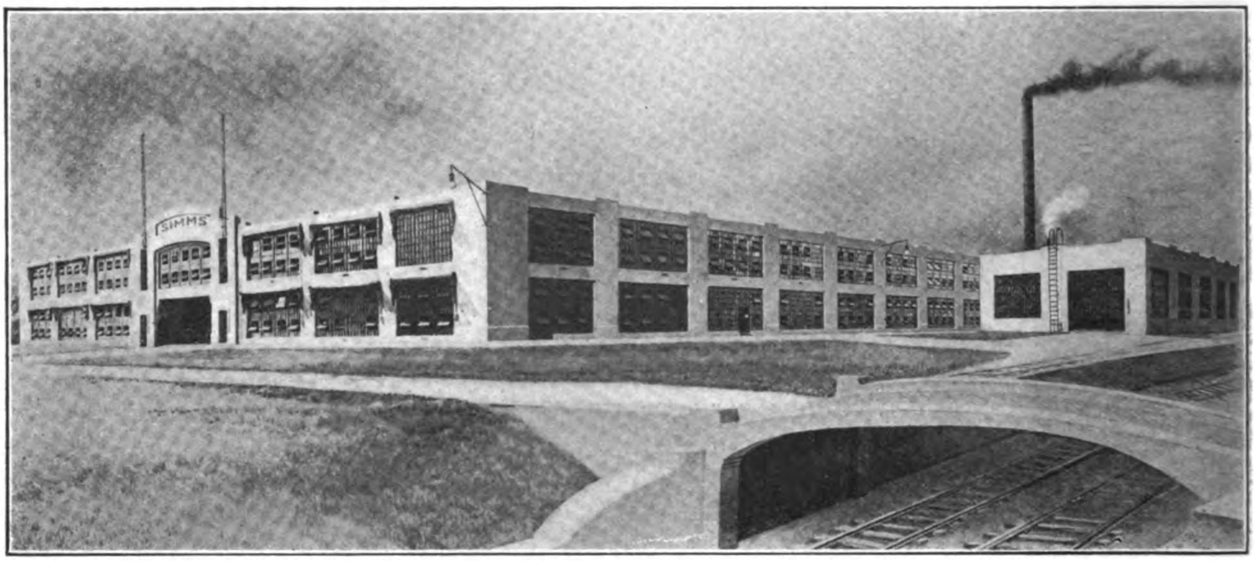
J. R. McKinley & Co. has purchased the Estancia garage at Willard, N. M.

The Perry Automobile Company, Montpelier, Vt., has leased the new Martin garage completed recently and will represent the Ford line.

P. J. Clifford has assumed the management of the Crocker House garage at New London, Conn.

The Oskaloosa Garage Company, Oskaloosa, Ia., has been organized and will conduct a general garage business, also an automobile livery. Howard Taylor is president and E. L. Anderson, general manager.



View of the New Simms Magneto Factory, Located at Bloomfield, N. J., on the D., L. & W. Railroad, a Thoroughly Modern Building of Reinforced Concrete.

J. H. Van Closter, Kansas City, Mo., has been granted a building permit to erect a garage at 207-211 West 14th street. It will be constructed of reinforced concrete and will cost $20,000.

The American Motor Sales Company, Syracuse, N. Y., has taken on the Cole line, in addition to the American, and the concern will be known in the future as the American-Cole Motor Company.

Charles Bellin Sons' Company, Cincinnati O., is making extensive alterations and improvements to its salesrooms at Vine and 15th streets.

The White Motor Car Company of Cleveland, O., is making plans to erect a two-story brick and concrete building to be utilized as a garage and salesroom at Craig and Atherton streets, Oakland, Penn.

Peter Horn and Bernard Mimno, North Adams, Mass., have opened a garage in the Grew shop on Commercial street in that city.

The Waterville Motor Company, Waterville, Me., expects to occupy its new garage at Main street and College avenue shortly. The structure will cost $25,000.

The Boston branch of the Velie Motor Vehicle Company announces that a contract has been closed with Nelson A. Seymour to handle the Velie line of pleasure and commercial vehicles in South Lancaster, Mass.

The Kerosene Gas Producer Company, whose plant is at Long Island City, N. Y., announces the opening of a sales office at 1926 Broadway, New York City, and requests that all communications in reference to its product be sent to that address.

WITH THE MANUFACTURER

The Boston branch of the Velie Motor Vehicle Company, Moline, Ill., will be represented at the New York show by Harold D. Bornstein, manager; James Coggeshall, New England travelling representatiye, and Lin McKie, manager of the commercial department.

Cole Agencies appointed recently are as follows: Savannah, Ga., M. A. Hayn; Red Bluff, Cal., F. W. Decker; Sacramento, Cal., E. C. Smitton; Stockton, Cal., Novelty Garage; Watsonville, Cal., E. B. Gilbert; Dixon, Cal., J. A. Spates; Colusa, Cal., Wood Yerxa; San Bernardino, Cal., E. A. Levreau; Youngstown, O., Ralph P. White; Freeport, Ill., D. E. Sunderland; Collins, Miss., W. R. Holloway; Urich, Mo., Robert McCoy.

J. H. Newmark, for four years advertising manager of the Oakland Motor Car Company, Pontiac, Mich., has resigned that position, having been advanced by the General Motors Company to the advertising department of the parent organization in Detroit, where he assumed his new duties recently.

The Ohio Motor Car Company, Cincinnati, O., in addition to showing a full line of 1912 models at New York will exhibit at Chicago and Boston.

The Moon Motor Car Company, St. Louis, Mo., recently added another floor to its building at Main and Douglass streets to increase its capacity for the manufacture of automobiles and supplies.

The Randolph Motor Car Company of Flint, Mich., has been sold by the General Motors Company to Eugene G. Goldman of Chicago. The latter owned the plant two years ago.

James F. Evans was appointed advertising manager of the Lozier Motor Company, Detroit, recently, succeeding C. A. Emise, who took the place of F. C. Chandler as sales manager. The latter is now general manager. Mr. Evans has become well and favorably known to the automobile industry and was at one time advertising manager of the Brush Runabout Company, Detroit.

The Haynes Automobile Company, Kokomo, Ind., occupies a plant covering an area of 7.5 acres of ground and the six buildings provide a floor space of 400,000 square feet. In the accompanying illustration is depicted the structures which are fire proof, being of concrete, steel and brick.

The Bright carburetor will be manufactured by a company incorporated at Indianapolis, Ind., composed of the following: S. M. Brundage, Ulric Z. Wiley, Clifford Arrick, Harry S. Rominger and Dr. C. E. Day. The vaporizer invented by Martin C. Bright has a gravity automatic feature which it is claimed will prevent flooding or choking the motor.

J. F. Gfrorer has been placed in charge of the Alco service department of the American Locomotive Company, New York City. Since joining the company he has been engaged in special work. He has been associated with the automobile industry since 1903, having filled several important positions for well known companies.

The Briggs-Detroiter Company, Detroit, a recently incorporated concern, has secured a factory plant comprising about two acres of ground north of Holbrook avenue in that city.

The Firestone Tire & Rubber Company, Akron, O., opened a direct factory branch at 1521 Commerce street, Dallas, Tex., Jan. 1. It will be under the management of P. B. Talbot, for many years a travelling salesman for the company.

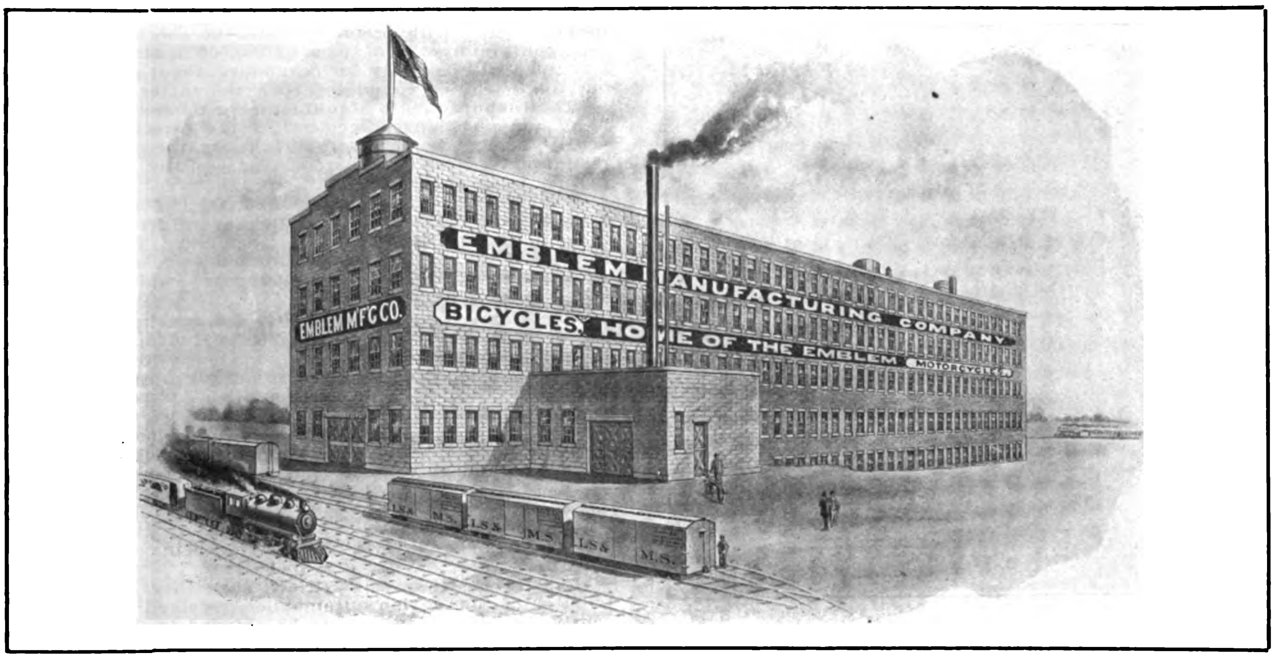
W. F. Byrket, formerly of the Newcastle factory of the Maxwell-Briscoe Motor Company, has been appointed manager of the Indianapolis, Ind., branch of the United States Motor Company, New York City. Thomas L. Marshall, who assumed charge of the branch temporarily, has been appointed assistant superintendent of the central sales district. The territory includes practically all of the central states.

The Hartford Suspension Company, Jersey City, N. J., has opened a factory branch at 1524 Grand avenue, Kansas City, Mo. Henry Riemer is manager.

C. E. Stebbins, head of the order department of the Studebaker Corporation's E-M-F factories, has been assigned to the management of the Sioux Falls, S. D., branch. His associates presented him with a handsome travelling bag upon his departure from Detroit.

The Auto Appliance Manufacturing Company, Akron, O., which is making a self-starting device for motor cars, and which was incorporated recently, has elected the following officers: President, J. W. Miller; vice president, J. A. Swinehart; secretary and general manager, A. Auble, Jr.; superintendent, C. W. Steele; sales manager, C. C. Walker.

The Remy Electric Company, Anderson, Ind., announces the opening of a service station at Dallas, Tex., where users of the Remy ignition devices will be taken care of. The department will be in charge of M. A. Price, formerly connected with the New York City branch.



Factory of the Emblem Manufacturing Company, Angola, N. Y., Where the Well Known Emblem Motorcycles Are Produced.

The Stuyvesant Motor Car Company, Cleveland O., has taken over the Grant-Lees Machine Company and a new $250,000 corporation has been formed to manufacture on a large scale the Stuyvesant, or rebuilt Gaeth car. Ground has been broken for a $65,000 building adjoining the plant of the Grant-Lees Machine Company, and 50,000 feet of additional floor space in the latter building will be utilized by the mechanical department. About 165 machinists and 200 others will be employed as soon as the new structure is completed. The new company expects to produce about 100 cars by July 1.

Albert H. Doolittle, advertising and publicity manager of the Knox Automobile Company, Springfield, Mass., has resigned his position. He is well known to the trade through a long practical automobile experience which has taken him through every step of motor car manufacture, distribution and advertising, so that his new venture as a specialist in this class of publicity will be followed with interest.

Grant L. Egan has resigned as advertising manager of the Motor Car Equipment Company of New York City and will devote his attention to a general advertising business under the name of the Catalog Publishing Company, World building, New York City.

The Premier Motor Manufacturing Company, Indianapolis, Ind., is publishing an eight-page paper called "The Motor News," in which is described and illustrated in an interesting manner the story of the ocean-to-ocean trip of the Premier cars, made recently.

The Velie Motor Vehicle Company's Chicago branch has appointed the Columbia garage, 335 West Madison street of that city, agent for the Velie pleasure and commercial vehicles. A service station will be maintained.

The Stewart & Clark Manufacturing Company, Chicago, maker of Stewart speedometers, announces an addition to its already extensive plant which is shown in the accompanying illustration. The new structure will cost $100,000, will be equipped with modern machinery and utilized for the manufacture of drop forged swivel joints.

The Penn Motor Car Company is building a plant at New Castle, O. The main building will be 60 by 510 feet and will have six wings, each 60 by 150 feet. These are to be completed by Jan. 10.

C. R. Dashiell, manager of the Milwaukee, Wis., branch of the Studebaker Company, has been transferred to the Chicago office, where he will have charge of the retail department.

J. H. Newmark, for the past three years advertising manager of the Oakland Motor Car Company of Pontiac, Mich., and formerly assistant manager of the Olds Motor Works, has been transferred to the advertising division of the General Motors office at Detroit.

B. F. Blaney, who was appointed sales manager of the Havers Motor Car Company of Port Huron, Mich., recently, is now in the East appointing agents for the Havers line. He was formerly general sales agent for the Johnson Service Company of Milwaukee, Wis.

The K-W Ignition Company, Cleveland, O., maker of the well known K-W ignition specialties, is occupying a new factory completed recently. The structure is fire proof throughout, being of steel construction with reinforced concrete. It is 75 feet wide and 165 feet long, and has over two acres of floor space. It will be utilized exclusively for the manufacture of K-W magnetos, spark coils, master vibrators and road lighting outfits. This large plant was necessary because of the great increase in the volume of business.

F. H. Quick, formerly with the Gibson Auto Company, Indianapolis, Ind., and the United Motors Company of the same city, has joined the sales force of the Findeisen & Kropf Manufacturing Company of Chicago, maker of Rayfield carburetors.

The Remy Electric Company, Anderson, Ind., which absorbed the American Electric Headlight Company recently, has purchased all patents, designs, etc., of the Peters Electric Headlight for steam locomotives. New buildings will be erected at Anderson to care for the increased production of the Peters lighting apparatus.

Albert F. Mais, formerly of the Mais Motor Truck Company of Indianapolis, Ind., and well known in motor car circles, has joined the staff of Walter E. Flanders at the Studebaker Corporation plants at Detroit as consulting engineer.

The Oakland Motor Car Company's plant at Pontiac, Mich., now comprises eight buildings providing 15 acres of floor space, as several additions were made recently. The company plans an output of 6000 Oakland cars for 1912 and at present 1200 workmen are employed. Eight different models are being manufactured.

H. A. Gilmartin, head of the moving picture department of the Studebaker Corporation, is back from Europe where he installed several sets of films, depicting the methods of building Flanders and E-M-F cars.

Clifton C. Edwards has been made manager of the Boston branch of the Marquette and George Lighthall will represent the sales department.

The Moline Automobile Company has opened a branch at Omaha, Neb., at 20th and Harney streets. D. M. Beal is manager.

Louis Hendon has been appointed assistant superintendent to George Schuster in the service department of the Thomas Motor Company of New York City.

The Matheson Automobile Company, Wilkesbarre, Penn., will open a completely equipped service bureau in Boston. The building is located on Commonwealth avenue and the department will be in charge of Roy A. Faye.

The Hudson Motor Car Company, Detroit, Mich., expects to occupy its new factory shortly. The new structure adjoins the east end of the plant, is 530 by 60 feet and two stories in height, and constructed of steel and concrete. It will afford an increase of 63,000 square feet of floor space.

G. S. De Lany, formerly with the Stevens-Duryea Company, has entered the employ of the Matheson Automobile Company as factory manager and will be in direct charge of the production department.

E. P. Horton, who was recently appointed manager of the United Motor Atlanta Company, Atlanta, Ga., southern branch of that division of the United States Motor Company, New York City, was formerly manager of the company's branch in Syracuse, N. Y.

The American-Marion Sales Company, New York City, which handles the Marion and American cars, is established in commodious quarters at Broadway and West 63rd street. In the illustration appended herewith is shown the four-story building which houses the product of the American Motors Company, Indianapolis, Ind., and Marion Sales Company of the same city.

AMERICAN MARION SALES CO.

Handsome and Commodious Quarters of American-Marion Sales Company New York City.

A. R. Rousseau, well known to the automobile industry, has been appointed western sales manager of the Imperial Motor Car Company, Jackson, Mich., with headquarters at 2216 Michigan avenue, Chicago. He was formerly connected with the executive forces of the General Motors Company.

The Maytag-Mason Automobile Company, Waterloo, Ia., has been reorganized and will be known in the future as the Mason Motor Company. The business will be conducted by H. W. Hayden, W. B. Wallace and E. R. Mason.

The Studebaker Corporation, Detroit, announces the appointment of Philip E. Hawley to take charge of the New England business of the concern. Mr. Hawley, who is well known to the automobile trade, will make his headquarters at Boston, where he will have entire charge of the wholesale business for this section.

The Henderson Motor Sales Company, distributor for the Cole Motor Car Company, Indianapolis, Ind., has appointed the following new Cole agencies for the State of New York: Peterman Motor Sales Company, Jamestown; R. L. Cooley, Batavia; William R. Hopkins, Bath; North Avenue Garage, Fiskkill-on-the-Hudson; J. Harry Cook, Cooperstown; Dewar & Diefendorf, Oneonta.

The Velie Boston Branch of the Velie Motor Vehicle Company, Moline, Ill., announces that Amos J. Shorey will handle Velie pleasure and commercial vehicles in Waterville, Me. Tucker & Palmer of Tarrifville, Conn., will act as sub-agent for the J. T. Curtiss Company of Simsbury, Conn., Velie representatives in western Connecticut.

The Pacific Coast Borax Company, 100 William street, New York City, is marketing a product for both chauffeur and owner called "Grime-off." It is made in powder form and packed in a convenient can fitted with a sifting top, a sanitary feature which will appeal to users.

The Connecticut Telephone & Electric Company, announces the opening of an office, stock and show room at 231 West 54th street, New York City, where a complete stock of Connecticut ignition devices will be carried.

Ernest L. Gould, superintendent of the service department of the Velie Boston branch, left recently for a visit to the factory at Moline, Ill. He will visit the Chicago branch while en route.

The Ohio Motor Car Company, Cincinnati, O., announces that Breisario E. Diaz of Cartegena, Colombia, South America, who visited the factory recently, will handle the Ohio line in his country.

D. Kirke Moore, formerly of Buffalo, N. Y., has accepted the position of general sales manager of the Western-Mott Company, Flint, Mich., but will retain his interests in the American Distributing Company. He is well known to the automobile industry having been engaged in the manufacture and sale of axles, wheels, transmissions and steering gears.

The Colby Motor Company, Mason City, Ia., will enlarge its factory and increase the number of workmen, according to an announcement made by the officers of the company.

The Stevens-Duryea Company, Chicopee Falls, Mass., has decided to begin the construction of a new plant and has acquired 40 acres of land in East Springfield, Mass., located on the Athol branch of the Boston & Albany railroad and the new Hampden branch of the New York, New Haven & Hartford line. The first building to be erected will be four stories in height, 500 by 80 feet, containing a floor space of 160,000 square feet. This structure will be ready for occupancy about June 1. Other buildings will be completed soon thereafter.

The Cleburne Auto Manufacturing Company, Cleburne, Tex., announced at a meeting of the directors held recently that prospects were bright, as the first machine manufactured had withstood successfully a thorough testing under varying conditions.

The White Company, Cleveland, O., has established a large agency in Buenos Ayres and several sub-agencies in other parts of the Argentine Republic. The company is pleased with the prospects for commercial vehicles in place of the primitive methods now employed on the large coffee and sugar plantations.

The Maxwell-Briscoe Motor Company's immense plant at Tarrytown, N. Y., is located on the Hudson river which body of water froze recently sufficiently to permit the use of ice boats and motor cars. Testers at the factory took advantage of this to try out the Maxwell cars. The smooth surface of the ice permitted of great speed and the drivers thoroughly enjoyed the novel conditions.

The Cole Motor Car Company, Indianapolis, Ind., subjects each and every Cole chassis to a severe test before the body is fitted and the machine painted. In and around the city the small army of testers may be seen daily driving their automobiles over the worst kind of roads, some of which are soft clay. After being tried out on the roads they are given a speed test.

Charles E. Riess & Co., New York City, general distributor of the Marion automobiles, received an order recently for 10 Marion cars to be shipped to South Africa.

Harry D. Miller, formerly of the Bridgeport Vehicle Company, has joined the sales force of the Blue Ribbon Garage Company, Bridgeport, Conn.

The Howard Automobile Company, Los Angeles, Cal., has opened its new warehouse at 1701 San Fernando street. The building has 10,000 square feet of floor space, a private driveway and spur track for loading platform, and will be equipped for quick handling of automobiles.

Edward Wells, Boston, who for three years has been connected with the E. R. Thomas Motor Car Company, both in Boston and Buffalo, has severed his connection therewith. He was assistant sales manager of the Thomas factory prior to his going to Boston.

The Ford Times, a monthly publication devoted to the interests of the Ford Motor Company, Detroit, has in its January number, an instructive article dealing with putting the model T car away for the winter.

Alden McMurtry announces that he has resumed the manufacture of the McMurtry mechanical horn which he states is the result of nine years experimental work.

C. L. Clark, formerly with the Driggs-Seabury Ordnance Corporation, and the Kelly Motor Truck Company, has joined the laboratory staff of the New Departure Manufacturing Company, Bristol, Conn., maker of ball bearings. Mr. Clark is a metallurgical engineer and graduated from the Case School of Applied Science at Cleveland, O., also the Ohio State University.

The Henderson Bulletin, a publication devoted to the interests of the Henderson Motor Sales Company, Indianapolis, distributor of the Cole line, contains in the February issue, a number of interesting illustrations in which Cole automobiles are prominent.

The Firestone Tire & Rubber Company, Akron, O., is issuing to the trade a very handsome wall calendar which is printed in colors.

WHAT LIMITS YOUR PROFITS?

Conditions That Generally Obtain and Militate Against Efficient Service and Satisfaction of Patrons—What Forms of Car Demonstration Pay?

It is a custom with those who propose to purchase motor vehicles to demand demonstration. With some this purpose is to carefully observe the operation of the machine under differing conditions. With others it is merely a pretext to ride as far as is possible without protest from the operator. Naturally no person having a prospective buyer with him cares to cause offense, and for this reason men whose patience has been exhausted have endured decided imposition rather than speak in just protest. The enthusiasm of the salesmen, who want to make sales, has often resulted in long rides with loss of time and considerable expense to the agent.

There are those careful and cautious buyers who exact tests that they would not attempt with their own property, but these are comparatively few. Those who have had experience with cars understand better than those who are "shopping" for their first machine. One might similarly classify the men and women who go about and ask that they be "shown" and, strange as it may appear, those who have the most knowledge desire the least exhibition work.

Most agents must please their callers. This cordiality often leads to assumption. The supposition is that driving must be pleasure to the dealer or the salesman and that either is willing to go anywhere and at any time. Few realize that there is material expense aside from the loss of time in taking a caller a few miles over the road.

Some representatives are more business-like. They have fixed times for demonstration and the time limit for each trial is necessarily established. They have stated times when the car, clean and well groomed, is displayed in the salesrooms, and they find that it is just as necessary to have it seen to good advantage as it is to show its capacities. So far as their own service is concerned they believe that as a matter of business the car they might use could be utilized to better result.

There are others who depend to a considerable extent upon their personality and good fellowship to bring them sales. It is natural enough that those who are included in this class must be as liberal in their entertaining as are those they do business with, and profitable transactions are the exception rather than the rule.

Another group believe that it is wise to make careful mechanical explanation of the construction of machines, a policy that is admirable when dealing with those versed in mechanics, and absolutely bewildering when the inquirer has little or no mechanical knowledge.

It is realized that every possible customer's ideas are different and needs widely differ, but there are certain well established policies or principles that can be applied or adapted to the conditions obtaining with nearly all car sales agencies.

This subject is decidedly important to all those engaged in selling cars. For the purpose of obtaining expressions from readers the editor of the ACCESSORY and GARAGE JOURNAL invites contributions approximately of 600 words which will be published at convenience. For the three most meritorious, $5, $3 and $2 will be paid respectively. Articles should be submitted within 30 days to "Demonstrations," the ACCESSORY and GARAGE JOURNAL. The names of those whose articles have been approved will be published in the April issue.

HOW ADVERTISING MATTER SHOULD BE DISTRIBUTED?

There is not a garage, salesroom, or office that does not in the course of a year receive printed advertising literature. Some of this is cheap and some is expensive, some is of standard lines and well known articles, some is of new products, some is of motoring necessities and some of what will convenience the automobilist. It is not possible to estimate even for illustration the total commercial value of such advertising matter, but while this is a factor so far as those who issued it are concerned, the real subject is the actual results to be obtained by careful and systematic distribution.

Publicity as originated in booklet, folder or other form has certain value if it reaches the people who might be interested. The matter is sent to those handling the line it explains or promotes and it is assumed that distribution is made by the dealer or agent. This is admirable in theory but under any circumstances there is a great waste and loss through carelessness and neglect, and often literature of special merit is set aside with no endeavor made to secure the business it might create and attract.

It is a fact that in the attention to other things regarded as more important the advertising is overlooked. This is a loss to all who might benefit, and business building is retarded when it might be stimulated. This applies to all alike but the larger the volume of transactions the greater the possibilities for expansion. In many stores and offices one may frequently see stacks of booklets and folders, neatly piled and perhaps covered with dust, which are abolutely worthless unless placed in the hands of an interested person. These might or might not be mailed, but this is an expense not often approved and the advertising is accumulated until an enterprising junkman carries it away.

The systematic distribution of such literature does not suggest itself to the average man. He regards the printed matter as something to be tolerated for a while and then tossed into the waste. Not a thought is given to the possibilities if the advertising were utilized. No one is instructed to hand to every visitor a booklet or folder and to call attention to the merit of the article it illustrates or describes; nor is it believed wise to mention that these are carried in stock or are secured to order.

There are numerous methods for using the advertising so as to directly benefit one, and to supplement the advertising campaigns which may be undertaken by the manufacturer or jobber from time to time, instead of permitting the literature to lie dormant and lose its value. There is a responsibility placed upon every person directing a business and where publicity can be obtained and utilized it is strange indeed that it is not always employed to advantage.

The editor is desirous of obtaining the views of readers of the ACCESSORY and GARAGE JOURNAL in the form of articles of not more than 600 words each, and for the three most meritorious will pay $5, $3 and $2 respectively. These articles should be submitted to "Publicity in the Store," the ACCESSORY and GARAGE JOURNAL, within 30 days. The names of those who articles have been approved will be announced in the April issue.

Read Great Money Making Agency Proposition on Pages 45, 46, 47.

HOW SHOULD REPAIR WORK CHARGES BE ESTABLISHED?

One of the most perplexing problems that presents itself to the owner and manager of the repair shop is the demand generally made by a customer that an estimate be given of repair cost before work has been begun and the true condition of the car learned by careful examination. It is well enough for the car owner to ascertain the total of any expense he is contracting, but it is also impossible to be truthful and accurate until work has actually progressed to dismantling, at least.

When the full extent of the repair is known some of the items could be definitely stated, but as there is generally a probability of discovery of other needed work if the machine is to be fully restored actual expense can seldom, if ever, be fairly determined. It would be unreasonable, and might be regarded as neglect, were a repairer to refuse to give attention that were needed, and yet an owner cannot always be convinced that his car has worn without his knowledge.

In any repair service the work cannot always be correctly estimated. The time required for obtaining a special part or fitting is always uncertain, and obstacles may be met with that will seemingly prolong the labor performed. There is a possibility that if estimate were made the figures would be more than the actual expense that might be incurred and the customer would be required to pay unnecessarily if the estimated price were exacted.

Where a work is taken on the basis of an uncertain price the repairer must charge enough to insure his own profit, and that there is a disposition to protect one's self cannot be denied. If the work is "shopped" and the owner accepts a price fixed as covering everything required he may be misled, because the one estimate may not include as complete service as another, and of course the total does not represent satisfaction.

It is assumed, of course, that the repairer is doing honest work. There is no intention of reflecting upon the business methods of any person, but it is meant that the owner is satisfied he is not being imposed upon. There are instances, however, where charges have been made for work that from every angle appear unreasonable and cannot be satisfactorily explained.

It is certain enough that the conditions stated will always obtain and as human nature cannot be changed it would be well for both repairer and customer if a recognized system or method of handling work could be devised. The subject is decidedly important and for the purpose of ascertaining the opinions of those who may have experience the editor invites them in written articles of not more than 600 words, which should be submitted to "Repair Shop Methods," the ACCESSORY and GARAGE JOURNAL, within 30 days. For the three most meritorious $5, $3 and $2 will be paid respectively. The names of those whose contributions have been approved will be published in the April issue.

HOW SHOULD POWER WAGONS BE MAINTAINED?

The increasing use of power wagons has developed a condition that must be met by changed methods. Where one machine may be in service it is well within the capacity of the operator to make adjustments and small repairs outside of the regular working hours, but where several vehicles are used the essential inspection and attention entails work that cannot be expected of the drivers if the desire is to uniformly maintain the machines. In connection with any haulage enterprise it is desirable that the transports be under the observation of as good a mechanic as can be consistently employed, and naturally responsibility must be established, which means that there must be a head. If the drivers serve without instruction there can be but indifferent results.

Where there is a comparatively small number of machines it may be possible for the owners of two or more equipments to combine a garage service, a competent mechanic and helper being employed to inspect the wagons at the conclusion of each day's work, make whatever adjustment and repairs are necessary and have them ready for service. Such a proposition may have a measure of economy, but it also has an element of inequality in that the condition of the cars depends to a considerable extent upon the character of drivers, and obviously the work on them will differ considerably. If it is believed that there will be an average work required on each there may be satisfaction with such a proposition, but this result is not always a probability.

Some men have found it advisable to store their power wagons in a first class garage, paying for a certain inspection and adjustment each night and a general examination Sundays. Others have believed it well to leave the attention as well as the operation to the drivers, and others have been disposed to leave all of the maintenance in the hands of the agent, or as much as he will engage to care for.

The supposition is that with the one or two machines it may not be economical to have the separate garage and exclusive attention, but there is no question that where there is a sufficient number of automobile vehicles this character of service is decidedly the better. There is a point, however, where the economy of the one method ceases and the other is begun. While it is true that conditions may vary to a considerable degree and experiences may differ broadly the knowledge that will obtain through consideration of the subject cannot be otherwise than decidedly helpful. With the purpose in mind of causing discussion of the proposition and developing from experiences what may benefit those who have to deal with such a problem, the editor invites written contributions relating to it of not more than 600 words, these to be submitted to "Power Wagon Maintenance," the ACCESSORY and GARAGE JOURNAL within 30 days. For the three most meritorious of these articles $5, $3 and $2 will respectively be paid. The names of those whose contributions have approval will be announced in the April issue.

May Remove to Warwood, W. Va.

Negotiations well nigh completed by representatives of the Board of Trade of Wheeling, W. Va., and the Hercules Tire & Rubber Company, Pittsburg, Penn., contemplate the removal of the company to Warwood, near Wheeling, where a factory and facilities for manufacturing are available.

Mansfield Company Is Reorganized.

The Mansfield Tire & Rubber Company, with capital of $300,000, has been organized by B. L. Chase, who was president of the Mansfield Rubber Company, Mansfield, O., to succeed to the business of the original company. Associated with Chase as incorporators are Walter F. Heene, George W. Heene, C. R. Grant and F. M. Bushnell.

A bronze alloy known as Littand bronze, which can be worked when heated and has six times the strength of bronze or brass is to be produced by the Littand Manufacturing Company, Kenosha, Wis., which concern is composed by A. Littand, president; Charles Anderson, vice president; William Anderson, secretary, and George Fisher, Jr., treasurer.

FROM EVERY POINT OF VIEW.

Will Form Indiana Branch S. A. E.

An Indiana branch of the Society of Automobile Engineers is to be formed with headquarters at Indianapolis, where about 40 of the 80 members of the national society reside.

Look for General Cut in Tire Prices.

It is expected that a number of the tire manufacturers will follow the example of the Michelin Tire Company which has announced a reduction of prices for standard shoes and tubes which approximates 10 per cent.

Prest-O-Lite to Stay at Indianapolis.

The Prest-O-Lite Company has been authorized by an ordinance passed by the city council of Indianapolis, Ind., to locate a plant within the city limits, subject to certain conditions, and is now seeking a site. This precludes the removal of the gas manufacturing and assembling plant from Indianapolis, which was stated to be determined before the passage of the ordinance. The company has a plant about five miles south of Indianapolis, which it will probably continue to utilize.

Madison Square Garden Show After All.

The F & D Company has taken title to the Madison Square Garden property, this being transferred by the Madison Square Garden Company, the owner of this noted metropolitan exhibition building. It is stated that there is no immediate prospect that the structure will be demolished, but possibly in another year the Madison avenue end will be destroyed and replaced by office buildings. So far as is known this means that the tower and that section housing the arena will be continued as they now are and will be available for shows and exhibitions.

Indiana Manufacturers Elect Officers.

The Indiana Automobile Manufacturers' Association has elected these officers: President, Frank E. Smith of the Maxwell-Briscoe Motor Company, Newcastle, Ind.; vice president, Will H. Brown of the Mais Motor Truck Company, Indianapolis; secretary, J. M. Ward of the Waverley Company, Indianapolis; treasurer, Fred N. Coates of the Lexington Motor Car Company, Connersville, Ind.; directors, George M. Dickson of the National Motor Vehicle Company, H. H. Rice of the Nordyke & Marmon Company, and E. M. McMorris of the Great Western Motor Car Company, Peru. The association is considering the organization of a tour by motor wagons that will traverse about 1500 miles and visit many of the principal cities and towns in Indiana, Ohio, Kentucky and Pennsylvania.

CHANGES WITH GOING CONCERNS.

Post & Lester Company's Broad Charter.

Through an amendment to its charter filed at Hartford, Conn., the Post & Lester Company, of that city, is authorized to manufacture and sell goods of all kinds.

P. H. P. Becomes Westfield Company.

The P. H. P. Motor Truck Company, Westfield, Mass., has been succeeded by the Westfield Motor Truck Company, which organization is headed by M. J. Macgill, who with others is interested in the Atlantic Motor Truck Company, New York, N. Y. The Westfield vehicles range from 1000 pounds to two tons capacity.

Lansden Not in International.

There is no connection whatever between the International Motor Company, which is the consolidation of the Mack and Saurer companies, and the Lansden Company, maker of electric service wagons, which concern was recently purchased by interests represented by W. L. Case of the Mack Bros. Motor Car Company.

Pope Company to Change Charter.

Preparations are making for the dissolution of the Pope Manufacturing Company as organized under Connecticut laws and its incorporation under Massachusetts law, this to be done to insure to the Massachusetts stockholders, who are in the majority, certain advantages in exemption from taxation in Massachusetts, which exemption does not include corporations organized under the laws of other states.

New McAdamite Factory at Detroit.

The United States McAdamite Metal Company, Brooklyn, N. Y., manufacturer of metal products, has purchased a site at Isabella avenue and E street, Detroit, Mich., on which it will erect a one-story steel and concrete building 90x150 feet as a branch factory.

Swetland Is Chairman.

Having acquired a substantial interest in the concern H. M. Swetland, formerly president of the Class Journal Company, has been elected chairman of the board of directors of Wyckoff, Church & Partridge. This company has the sales agency for the United States for the Commer trucks, and is now manufacturing the machines in this country under license from the English company.

Will Establish Town and Plant.

A town to be known as Appleby is to be established near Davenport, Ia., by the Western Implement and Motor Company, which recently acquired control of the Colby Motor Company of Mason City, Ia., where a tract of 80 acres of land has been bought on which it is planned to build seven factory buildings, two storehouses and three 100,000 gallon tanks for storing water, gasoline and fuel oil. The buildings are to be one story, save the office, which will be two stories, of reinforced concrete, and will be of sawtooth roof design. One building is to be 1000 by 80 feet.

SEEKING SITES FOR FACTORIES.

Grand Rapids Wants Hoosier Company.

The Association of Commerce of Grand Rapids, Mich., is endeavoring to raise $100,000 to secure the location of the Hoosier Limited Truck Company in that city.

Ford Factory at Los Angeles.

If the policies of the Ford Motor Company are not changed a branch factory of considerable proportions will be built on the Pacific Coast, probably at Los Angeles, Cal., from which it would be possible to distribute cars to the states west of the Rocky Mountains, to Hawaii and the various Asiatic countries.

Fishback Company Wants Factory Site.

With an authorized capital of $3,000,000 the Fishbach Motor Company, Newark, N. J., is seeking a site for a factory and announces its intention to begin the construction of a plant by June 1. Overtures have been made to bodies promoting local industries in several cities.

Lauth-Juergens Branch at Gibsonburg.

The Lauth-Juerbens Motor Car Company, Fremont, O., has completed plans for the establishment of a branch factory at Gibsonburg, O., and is also to enlarge its Fermont establishment.

Receiver Controls New Albany Concern.

The New Albany, Ind., Trust Company has been appointed receiver of the American Automobile Manufacturing Company of that place at the petition of several stockholders who maintain that control by a court is necessary for the protection of their interests, although they maintain the assets largely exceed the liabilities. Several suits instituted by holders of stock revealed conditions which threatened the disruption of the concern, and some who were considerably interested decided upon the course taken.

Read Great Money Making Agency Proposition on Pages 45, 46, 47.

ACCESSORY MAKERS MEET.

The annual meeting of The Motor & Accessory Manufacturers held at New York City recently was unusually well attended. In his annual report, President H. T. Dunn announced that the membership had been increased to 251. The following were re-elected as members of the board of directors to serve for three years: H. T. Dunn, Fisk Rubber Company; L. M. Wainwright, Diamond Chain & Manufacturing Company; E. S. Fretz, Light Manufacturing & Foundry Company. F. C. Billings, Billings & Spencer Company, was elected to succeed F. E. Castle. The new office of assistant treasurer also was created.

The election of officers resulted as follows: President, H. T. Dunn; first vice president, James H. Foster; second vice president, C. E. Whitney; third vice president, Claire L. Barnes; secretary and assistant treasurer, L. M. Wainwright. The following committees were appointed by the president:

Show and allotment: D. J. Post, H. E. Raymond, C. T. Byrne, James H. Foster, F. C. Billings.

Finance: James H. Foster, H. E. Raymond, C. T. Byrne, W. H. Crosby.

Traffic: D. J. Post, Claire L. Barnes, George Baum.

Membership: L. M. Wainwright, C. E. Whitney, T. J. Wetzel.

CHANGES AMONG THE TRADE.

Steenrod to Make Spark Plugs.

George Steenrod is the head of the Steenrod Auto Supply Company, which has begun the manufacture of spark plugs at Wheeling, W. Va.

De Long Joins Apple Company.

R. B. De Long, formerly with the Dayton Motor Car Company, has been engaged as manager of production for the Apple Electric Company, Dayton, O.

Neighbors Is Hupp Sales Manager.

R. G. Neighbors is now sales manager of the Hupp Motor Car Company, Detroit, Mich., a position which he filled from the appointment of C. D. Hastings to the general managership of the company several months since.

Smith Leaves Metzger for R-C-H.

After a service of a year with the Metzger Motor Car Company, Detroit, Mich., and previous to that five years with the Packard Motor Car Company, Walter R. Smith has been made chief accountant of the R-C-H Corporation.

Bailey Active in Abbott Company.

Clayton E. Bailey is now an active element in the Abbott Motor Company, Detroit, Mich., in which he is heavily interested, he having resigned as president of the Bailey Table Company, Jamestown, N. Y., to remove to Detroit.

Wilson to Head Warren Interests.

L. E. Wilson is to succeed J. G. Bayerline as vice president and general manager of the Warren Motor Car Company, Detroit, Mich. He was formerly secretary of the Detroit Board of Trade, from which position he recently resigned.

Hewitt Is Northway Superintendent.

The production of the Northway Motor & Manufacturing Company, Detroit, Mich., is superintended by G. H. Hewitt, formerly chief inspector for the F. B. Stearns Company, Cleveland, O., and before that for six years superintendent of the Garford Company, Elyria, O.

Carter Motor Car Corporation Fails.

Wilton J. Lambert and A. Gary Carter are receivers for the Carter Motor Car Corporation, Washington, D. C., with a factory at Hyattville, Md., a concern that has existed for about eight years and has during that time marketed but few machines. The first machine built was known as the Carter, which was equipped with two engines, but the Washington, the latest vehicle, was conventional

Bennett Making Good Recovery.

The climate of Florida, where he recently went to combat an illness that prevented the use of his vocal organs, has been so beneficial to George W. Bennett, vice president and general sales manager of the Willys-Overland Company, that he expects to return to Toledo, O., early in March well advanced toward complete recovery.

United States Tire Managers Change.

Joseph C. Weston, manager for the western district of the United States Tire Company at San Francisco, Cal., has succeeded to the management of the central district of the company's organization, with headquarters at Chicago, replacing A. I. Philp, resigned. Mr. Weston's former position has been filled by C. A. Gilbert, who was assistant manager of the eastern district with headquarters in New York.

Pelletier Handling Universal Copy.

In addition to his duties as advertising manager of the Studebaker Corporation and the Flanders Manufacturing Company, E. LeRoy Pelletier has assumed the conduct of similar work for the Universal Motor Car Company, Detroit, Mich., which concern may be merged with the Flanders Manufacturing Company, negotiation to accomplish this now being in progress.

Federal New Plant Occupied.

The Federal Motor Truck Company, Detroit, Mich., has practically completed the removal from the old factory to the plant of the Van Dyke Motor Car Company, which was recently acquired. The structure is modern in every respect and there is abundant room for expansion. The plant has a capacity of about 1000 trucks a year.

Beaver Brings Out New Model.

A new model Beaver, four cylinders, with bore of 3.25 inches and stroke of five inches, has been placed in the market by the Beaver Manufacturing Company, Milwaukee, Wis. The cylinders are cast en bloc, which is a departure from the practise obtaining with the other engines produced by this company.

Will Build New Goodyear Branch.

To replace the branch that was recently destroyed by fire at Detroit, Mich., the Goodyear Tire & Rubber Company will erect a new structure especially designed for the needs of the business. The loss suffered with the burning of the building was approximately $160,000.

Cleveland Company May Buy Plant.

The Cleveland Motor Truck and Manufacturing Company, Cleveland, O., has made a proposal to the Howard Motor Company, Galion, O., for the purchase of the plant of the latter concern, and if it is accepted the factory may be continued as a branch.

Akron May Secure Ideal Company.

Negotiations are progressing between representatives of the Ideal Commercial Car Company, Detroit, Mich., and Akron, O., capitalists, which have as an object the removal of the concern to Akron provided a sufficient investment is made to justify this change. It is proposed, if the deal is made, to materially increase the producing capacity of the company's works.

R-C-H Corporation Increases Capital.

The capital of the R-C-H Corporation, Detroit, Mich., has been increased from $800,000 to $1,000,000 and the several interests represented by the concern are included in the corporation. Plans are made to produce 10,000 R-C-H cars and 1000 Hupp-Yeats electric cars for the present season. The works of the corporation will be considerably expanded with the advent of propitious weather.

THE ACCESSORY AND GARAGE JOURNAL

Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. I. PAWTUCKET, R. I., MARCH, 1912. No. 5

TRADE INFORMATION EXCHANGE.

Free Service Established by the Accessory and Garage Journal to Furnish Confidential Business Intelligence, Relating to Production and Distribution, to the Buying and Selling Interests of the Nation.

The demand by the trade, as represented by the dealers in and agents for both pleasure and commercial vehicles, accessories and supplies, the garage and public service stations and repairmen, for information relative to the qualities and merits of all marketable products in the automobile industries, has attained such proportions as to impel the establishment of a Trade Information Exchange, in connection with the publishing of the Accessory and Garage Journal.

This service, complete and comprehensive in every detail, is absolutely without charge to all concerns listed in the Buyers' Guide in The Automobile Journal, Motor Truck and the Accessory and Garage Journal, and to all automobile dealers, accessory and supply dealers, garage and public service station owners, and repairers, who are regular subscribers to the Accessory and Garage Journal. This service does not extend to manufacturers and selling agents for manufacturers not listed in the Buyers' Guides of the publications named.

This service offers to all manufacturers of power driven vehicles, equipment and supplies, who are entitled to its advantages, the opportunity to reach those interested in selling and distributing in any town, city, state or section of the country.

No business man has always at his command the trade information that might be desirable. Demands made upon the trade are such that no one can compile such reference as will inform him of every industrial fact it may be imperative to know. He has no source available from which this information may be obtained. This Exchange has been established to supply any industrial or trade fact to its members at request. This service economizes the time of the business man and his customer; it minimizes correspondence; it places the dealer in contact with every product in the particular line under consideration and the manufacturers' selling propositions; the dealer purchases that which will best meet his requirement and satisfy his customer, and the dealer has the use of this information in all his future transactions. It gives every interest in the market equal consideration and opportunity.

Thousands of active enterprises, seeking expansion or desirous of making new connections, have in this service the means of conducting their negotiations confidentially and securing information that must be beneficial to all manufacturing and distributing interests.

All trade information passing through the Exchange is of a confidential character. Inquiries received from those in the trade relative to prospective connections or associations are distributed to the manufacturing interests of which information is desired. The replies of the manufacturers or selling agents pass through the Exchange direct to the inquirer, who then conducts his negotiations as his judgment dictates.

Manufacturers through this service will be able to reach desirable trade interests in territory now having no representation, and complete their organizations.

To illustrate the Trade Information Exchange service:

John Smith of Phoenix, Ariz., desires to secure the agency for a car selling for $1200. He communicates with the Exchange, stating his limitations and that he is desirous of obtaining sales rights for a specified territory. His inquiry is given a number. Its purport is submitted to all makers of cars within the price limit fixed entitled to the service. The replies of the manufacturers to the number are received at the Exchange and are forwarded to John Smith. He considers the facts and propositions submitted and closes the contract.

John Smith has had opportunity to pass upon all the qualities of every car and every proposal. He selects that which he judges will be the best from a business point of view. Every manufacturer has received equal consideration and each has the knowledge that his production has been approved or rejected from its actual qualities and merits.

Thomas Jones, who is to establish a garage, desires a full equipment. In his letter of inquiry to the Exchange he states his exact requirements, and these are submitted to those producing the lines in which he has interest and from which he will make a choice.

Any dealer desiring to expand his business and make new connections can make the fullest inquiry in the market through the Exchange.

This service extends to all branches of the industries. The correspondence is passed and submitted as stated, the negotiations being as confidential as those concerned in them may desire.

To facilitate the interests of the Exchange and those whom it is intended to serve, address all correspondence to the Trade Information Exchange, Accessory and Garage Journal, Times Building, Pawtucket, R. I.

MAILING LIST COST AND SERVICE.

Expense of Doubtful and Limited Publicity Conducted by the Individual or Enterprise, Reduced 80 Per Cent. and Its Efficiency and Scope Extended to the Entire Industry and Trade.

EVERY business of consequence, no matter whether its market is local, sectional, national, or international, is exploited by the distribution of information to its regular, occasional or prospective customers. The purpose is to bring to the direct attention of those constituting its market facts that cannot be supplied through other channels. To gain publicity at an opportune time is the main object, it being believed that this can best be accomplished by what is regarded as nearest approaching a personal appeal. The mail is the natural and most systematic means for distribution and it is always available. It affords to all the same rapid and economical facilities. The value of its service has been recognized and utilized to an extent that is little realized save at periods when the enormous resources of the government are temporarily inadequate to maintain the scheduled collections and deliveries.

The man who maintains the local enterprise finds it profitable to make announcement through the mail. He can secure the attention of those who are directly concerned and the number of replies or inquiries is generally sufficient to justify the expenditure. Oftentimes the returns are exceedingly large. A means is afforded of tracing the direct results of the publicity sent out, and drawing customers to a special line or sale.

As the business is extended the use of the mail facilities affords every quality that caused its adoption in the community, with the additional merit of greater economy proportionate to the area covered. With the manufacturer the mailing list permits announcement at will to all engaged in the distribution and sale of his products. With the jobber similar advantages obtain, and with the representative there is for the third time the need of the systematized statement to probable customers.

Thus it will be seen that as the market is increased there is greater necessity of informing the public of every detail of purchasing knowledge. The mailing list was first adopted as a convenience. Now it is one of the most important divisions of a business, particularly if this business is transacted over a large area. In fact the disposition is to create such proportions for any enterprise engaged in.

The preparation of mailing lists is now specialized and these can be purchased as desired, but the purchaseable list, no matter how complete, must be constantly revised to maintain its value. The percentage of changes is decidedly large. The larger the number of addresses the greater the difficulty of maintenance and revision. The only possibility is through the use of first class postage, which just doubles the stamp cost. This is a decidedly heavy price for this insurance. The expenditure is the same for each time the list is utilized.

Some concerns practically departmentalize their mailing and combine it with their correspondence so far as this can be done, but divisions of this character require the services of several clerks and more or less special equipment. Careful system may be followed but the uncertainty is never eliminated because of the character of the lists. An average mailing list may include 3000 names and 5000 may be considered large. Few will reach 10,000 and more than that number is rarely ever accumulated. It will not be denied, however, that the larger the number of addresses reached by any given distribution of publicity matter the percentage of inquiries ought to be maintained. Not only this, but the cost is decreased as the list increases, because the initial expense is relatively less.

Considering a reasonably accurate list the purchase price would approximate $100, and if this is of 5000 names to properly maintain it and to do the addressing, folding, stamping, etc., would cost $30 a month. To use a list of 10,000 or 12,000 names would cost at least $50 a month for maintenance. These figures are reasonably accurate and are not more than a fair average cost for the service. To employ such a list to good advantage let us say that it it is used once a month, for active concerns can and do reach their customers and prospects much oftener.

The next item is the printing, and this means that the copy must be prepared, the cuts made and the proofs revised by direct supervision, and a very low estimate of the cost by pages follows:

	Copies		
	5,000	10,000	12,000
One page	$15.00	$20.00	$22.50
Two pages	20.00	30.00	35.00
Three pages	22.50	37.50	42.50
Four pages	25.00	45.00	50.00

The cost of a fair grade of envelope is not less than $1 a thousand, and the cost of stamps is not varied by the quantity purchased.

Estimating the cost of circularizing by using the mailing list the following figures will be a reasonable average:

One Page—

Copies	5.000	10,000	12.000
Printing	$15.00	$20.00	$22.50
Envelopes	5.00	10.00	12.00
Stamps, (1c)	50.00	100.00	120.00
Addressing, maintenance	30.00	50.00	50.00
	$100.00	$180.00	$204.50
Cost per copy mailed	2.00c	1.80c	1.70c

Two Pages—			
Copies	5,000	10,000	12,000
Printing	$20.00	$30.00	$35.00
Envelopes	5.00	10.00	12.00
Stamps, (1c)	50.00	100.00	120.00
Addressing, maintenance	30.00	50.00	50.00
	$105.00	$190.00	$217.00
Cost per copy mailed	2.10c	1.90c	1.80c
Three Pages—			
Copies	5,000	10,000	12,000
Printing	$22.50	$37.50	$42.50
Envelopes	5.00	10.00	12.00
Stamps, (1c)	50.00	100.00	120.00
Addressing, maintenance	30.00	50.00	50.00
	$107.50	$197.50	$224.50
Cost per copy mailed	2.15c	1.97c	1.87c
Four Pages—			
Copies	5,000	10,000	12,000
Printing	$25.00	$45.00	$50.00
Envelopes	5.00	10.00	12.00
Stamps, (1c)	50.00	100.00	120.00
Addressing, maintenance	30.00	50.00	50.00
	$110.00	$205.00	$232.00
Cost per copy mailed	2.20c	2.05c	1.90c

The above tabulation relates only to the use of the cheapest postage. To give the insurance of delivery and attention that desired first class postage must be used, and this will increase the cost of mailing 5000 copies exactly 100 per cent. One may ascertain from the above that it approximately increases the cost of mailing 10,000 four-page circulars 50 per cent. It will be seen that the actual printing expense is from 15 to 22 per cent. of the bill, and the remainder goes for the mailing, and maintenance. With first class postage this percentage is materially decreased.

Considering the facts stated it will be understood that the cost of the number of copies that reach live purchasing interests is relatively larger than is indicated by the tabulation, for everything depends upon the mailing list. For instance, if there be 10 per cent. "dead" this increases the cost in the same ratio, and taking the single piece it will be seen that this is a material advance. There is no good reason for using a poor mailing list and if it is kept to the highest standard, systematic and careful supervision is necessary. It is not uncommon for lists that are assumed to be high class having names of persons dead for years, and of addresses of persons not even known.

In contrast with this form of publicity may be noted the service afforded by the Accessory and Garage Journal, which has a circulation in excess of 12,000, guaranteed to any advertiser. The cost for a page a single time is $60 and by yearly contract this price is reduced to $50. Comparing this with the tabulated facts it may be noted that the cost of a single page is but half the expense for reaching 5000 persons, and less than 25 per cent. of the cost of reaching 12,000 persons, with a single page circular.

The price of two pages would be $100 in the magazine and a two-page circular to 5000 addresses would cost $105, and $217 if sent to 12,000. Three pages of the magazine would entail an expense of $150, and a three-page circular sent out with penny postage to 12,000 would cost nearly 50 per cent. additional, while the $200 charged for four pages would be less by $32 than the expense for reaching 12,000 with a four-page circular. Taking first class postage it will be understood that one could advertise in three pages of the Accessory and Garage Journal regularly by contract for the cost of sending a single page circular to 5000 addresses.

Regarded from any angle it will be found there is surprising cheapness in the service of the Accessory and Garage Journal. Its mailing list is the most complete compilation of actual buyers that exists. Its real value is in the thoroughness of its compilation and the completeness of its revision, a work that has been systematized with extreme care and with the one purpose of establishing its commercial worth. It deals with a market and a series of industries that have grown with marvellous rapidity and with widely extended relations, and its specialized intelligence has a distinct place and is depended upon as authentic. It is the only publication of its kind in America and as a trade paper for the trade it reaches the executives and the buying interests of every industry directly identified or allied with the vehicle production or marketing.

HOW SHOULD SHOP CHARGES BE ESTABLISHED?

Editor Accessory and Garage Journal:—

The problem of arriving at the cost of an overhauling job before the work is completed, has been satisfactorily solved by some of the larger automobile concerns in the manner stated below.

When a customer takes his car to a repair shop for an overhauling, he naturally wants to know the approximate cost of the job before authorizing the work. He cannot be blamed for taking this attitude, as the charges for overhauling are, in some cases, greatly out of proportion to the value of the machine. The automobile manufacturers are largely responsible for this condition, owing to the extreme prices charged for repair parts compared with the selling price of the car.

It is, however, poor policy to estimate the expense of overhauling a car, for the following reasons:

First—It is utterly impossible for the repair man to know the extent of work necessary before dismantling the machine, and consequently he cannot make a fair estimate to himself or the customer.

Second—The repair man must make the price high enough to protect himself, and by so doing he is apt to lose the job by frightening the customer away.

Third—When an overhauling job is undertaken at a fixed price the question naturally arises as to whether the charge should include the replacing of all parts which are worn to any appreciable extent. There is such a vast difference between giving a machine a "thorough overhauling" and putting it in "shape to run" that it is unsafe to proceed until this point has been definitely settled.

Experience has shown that the following method is the only businesslike and satisfactory way of dealing with a proposition of this nature:

Explain to the customer who inquires as to the cost of overhauling his car how impossible it would be to make him an estimate before inspecting the dismantled car. Advise him that when you have taken the car down you will call him in or write him a letter explaining the exact condition and will then be able to give the approximate cost of doing the work. It is a good plan not only to furnish an itemized list of parts that must be replaced, but also to state the condition of such parts as gears, shafts, etc., which may be partially worn and yet good enough for several thousand miles additional service. If the questionable parts are not readily accessible, the customer will usually prefer that new parts be put in, rather than run the risk of laying up the machine for further repairs during the season. The easiest way to convince the customer that you are not trying to "pad the order" is to show him the worn parts, and explain from a mechanical standpoint the advisability of substituting new material. This procedure will prevent unpleasant arbitration of the bill, and the customer will go away with a feeling that the garage man has given him a square deal.

When a customer absolutely refuses to have his car dismantled without being given an idea of the cost, inform him that the charges will simply cover the catalogue price of the parts plus the time at a certain stated price per hour. Few drivers are, however, expert enough to determine from operating the car what parts require renewal, consequently it is out of the question to properly estimate work of this character. E. P. HOBART.

Detroit, Mich., March 14.

Editor Accessory and Garage Journal:—

In discussing this subject from a practical standpoint, it must be assumed that the car owner is satisfied that he will not be imposed upon. It would be useless to attempt to devise a system by which the manager of a repair shop could hope to handle repair work to the satisfaction of a customer whose confidence he does not possess. However reasonable the charge or thorough the work performed for a customer who distrusts the management, he will always have a lurking feeling that something is wrong. If the charge is as high or higher than he anticipated he feels sure he has been overcharged. If it is lower, he is afraid the work has been slighted. An owner's confidence, once forfeited, is extremely hard to regain, and it is a wise garage manager who early grasps the fact that the car owners as a class are possessed of more than average business ability and are quick to detect fraud in any form.

When extensive repairs are required, the owner is apt to hesitate to place the car in the hands of a repair man without protecting himself by securing an estimate of the repair cost. Not having been given the opportunity to disassemble the car to determine the extent of the trouble, the repairer is placed in a difficult position. He knows that a number of parts not actually the seat of the trouble will have to be repaired or replaced to put the machine in good order, and also that unforeseen difficulties may be experienced in effecting some usually simple operation. Under these circumstances it becomes evident that the best course to follow is not to attempt a definite estimate of repair cost.

It is at this point, that the manager of a repair shop appreciates the advantage of a strong hold upon the confidence of his customer, enabling him to explain that it is obviously impossible to furnish an accurate estimate, but that he is confident he can make the repairs as economically as anyone and believes that their previous dealings will substantiate his assertion.

Being able to convince the customer of these facts he should question him carefully as to the operation of the car when last in service and, if advised of unsatisfactory operation under certain circumstances, he should suggest what repairs are probably needed to overcome these difficulties. The more fully the ground is covered at this time, the less possibility there will be of controversy arising when repairs are begun and the need of various adjustments becomes evident.

Should the customer, for any reason, insist upon an estimate, the best course to follow is to fix the price considerably over the usual cost of such work, after having impressed upon him the difficulty of arriving at an accurate estimate. The customer naturally expects the repairer to state the maximum price for such work, and should it become necessary to charge the exact amount quoted he will assume that the charge has been raised to the limit, whereas, if the actual charge made is comfortably below the estimate, he is likely to feel that he has been given a square deal. There can be no excuse for a repair man taking advantage of a customer who has accepted such an estimate. If, when the work is completed, he finds that the price stated is higher than necessary to give him a fair profit, the actual charge made should be at the proper figure. He will thus obtain his just dues, and without question gain a satisfied customer, whose recommendation will be of inestimable value. A. L. WHITE.

Detroit, Mich., March 18.

ENGINE NOISES AT HIGH SPEEDS.

The experienced repair man has often noticed that some engines which operate very smoothly and quietly at low and medium speeds become coarse at higher velocities. It is often difficult to determine the cause of this peculiar and undesirable action. Sometimes it may be due to poor design or construction of the engine, but if the power plant has been produced by a reputable maker it is natural to assume that the question of balance of rotary and reciprocating parts has received the attention it deserves. As a rule, the objectionable sensation is a combination of very small but noticeable vibrations communicated through the floorboards and accompanied by more noise than the speed of the car seems to warrant.

In cases of this kind, the trouble is very often due to a slight slipping of the clutch, either of the plate or cone type, though it is more apt to happen between the plane frictional surfaces of the former than with the cone shaped members. When the engine is running fast and developing high power, it may produce just a little more than the clutch will transmit, especially where there is a very close margin in the design. The resulting slip makes for noisy operation. The slipping will not be as pronounced as though the clutch was inadequate for the work, and the engine does not race. There is, however, a small amount of slip each impulse this setting up the rhythmic and penetrating vibration that is distinctly annoying.

Another insidious cause of coarse running of good motors at high speeds is in unbalanced clutch parts. It is often noticed on examining the flywheel that it has one or more holes drilled in its rim, the purpose being to balance the wheel.

HOME MADE WATER PAIL.

A collapsible water pail is useful in the equipment of the car especially when touring. While this may be purchased one can be made easily and without expense. From an old inner tube select three or four feet of the rubber that is water tight. Cut the desired length from it and close one end by cementing it under pressure.

VALUE OF TRADE MARKED GOODS.

Worth of Guaranteed Products Evidenced by Imitations by Industrial Highwaymen, Who Exist by Cheapening the Standard of the People.

In industrial and commercial competition nothing has so much value as the distinction between productions made possible by the use of a trade mark. When it is placed upon the products by the maker it is guarantee of quality and value as standardized by the producer, and the existence of the brand is guarantee to the purchaser that the recognized qualities have been supplied at his demand. To establish public recognition of a trade mark is an undertaking of larger proportions. It can only be obtained by satisfactory and efficient publicity and by the distribution of production that inspires confidence and impels patronage through personal experience. The cost may be either large in amount of money invested to attract attention or in a long period of time devoted to patient and careful exploitation and in systematic maintenance of quality.

Under any circumstances a trade mark identifying goods has the same relative merit that has the name of an individual or firm in the business world. Either may be sacrificed, but both have value that is quite beyond price. Perhaps no better illustration may be made than to contrast the worth of the publicly recognized product with that unknown. With the former the purchaser is assured of what is regarded as worth the price. With the latter there may be equality in every respect, or there may be decided inferiority. One is known and the other is unknown. Human nature impels confidence in what we know. The assurance is given for the difference in price.

These facts have been especially emphasized in the lubricants industry where manufacturers have sought to produce what has been determined by scientific methods and practical and continued experiment to be best suited for specific purposes in internal combustion engine operation. These products have been standardized as to quality after exhaustive chemical research, perfected refining processes, and constant observation of operating conditions and requirements with many classes and types of motors. The natural purpose of those producing these lubricants has been to perfect manufacturing and preserve, if not improve upon, the standard.

In gas engine lubricity deterioration of quality is abundantly evidenced. It is manifested unmistakably and results are always clear to experts, but they are not always understood by those less experienced. There are those who regard the use of a cheaper article an economy, while there are others who believe that the real saving is in using that which will insure the largest production of power and the preservation of their machinery. The former class must be taught by experience and this knowledge is often costly. Under any circumstances quality is the real value and when merit has been established and is generally known it is guaranteed to those purchasing by the brand or trade mark.

Some manufacturers have individualized by a name, others by a design, still others by a form of container, each seeking what will be recognized by the public and will be accepted without question by the buyers. This has meant the education of the people to the merit represented by the name. While the identification means much to the owner it is even more valuable to the consumer, and it is the sole protection for both.

As in all other industries, there are those engaged in the manufacture and sale of lubricants who have sought to profit by imitation of marks and brands, placing in the market products that may be far inferior as to quality, and literally pirating upon the reputation of what they imitate. There is seemingly no limitation to the methods of those who are unscrupulous. They seek to reap large profits by obtaining relatively high prices, for the standards of the market are invariably selected for their attacks, and often distribute the cheapest products, for they realize that it is only a matter of time before means will be taken to restrain them, and their deception, when known, will eventually eliminate them from legitimate business.

Industrial highwaymen base their campaigns on the cupidity of the people, believing that the desire to seemingly economize will warp better judgment and impel the purchasing of what is apparently cheaper and is not guaranteed. One fact is evidently lost sight of, and that is that it would be immensely profitable for those whose products are imitated to sell the same qualities as the imitations. There is but one reason why this is not done, and that is the reputation established by the superior article, and the knowledge that what has been developed, oftentimes at enormous cost, would eventually be lost.

There are those who fail to realize that the manufacturer of the high grade products must necessarily pay the cost of protecting his customers. This adds materially to prices charged. Without this protection the products could be sold lower, and as a matter of fact it is the fostering of illegimate competition by the people that necessitates safeguarding a production and they compel themselves to pay more than might be required were it not for the consequences of their own false conception of economy. Manufacturing can be cheapened by producing in increasing volume and distribution expense can be likewise lessened when a sales organization has been perfected, but reputation cannot be continued save through continued satisfaction.

Because of the willingness of those who are ignorant, or who attempt to deceive themselves by attempted economy, there are men who are existing commercially on the reputation of enterprises of undoubted standing, who are the sharks and jackals of business, and who prosper proportionately to the audacity of their methods and the tolerance of those who are their victims.

While imitation and substitution may be regarded by some as competition it is apparent that those who substitute and imitate are the gainers only, and the purchasers are even the more imposed upon because they not only receive an inferior article, to their own direct loss, but they do not realize the quality, which is the sole recommendation of the superior product.

Notes on Working Steel—To drill and file hard castings or hard iron use turpentine on drill or file; you will be surprised at the result.

To restore burnt steel, heat to a red, cool in water and repeat two or three times. It will restore steel, to a certain extent, if not burnt too badly.

To caseharden anvil tools made of iron, heat to a bright red and rub on prussiate of potash or cyanide of potassium and cool in water immediately.

To weld low steel or iron to malleable castings, use one part of sal ammoniac, 10 parts of borax. Melt together, then grind fine.

A good and reliable welding compound is made of two parts of borax, one-half part of sal ammoniac. Mix and melt them together. When cold reduce them to a powder. Use same as borax.

THE BUSINESS MAN AND THE PATENT.

Protection of His Products by the Patentee Are Important Factors in Selection of Lines of Marketable Goods.

Immediate results are seldom considered by the business man when he takes up the distribution of an article, commodity or product. Establishment is always the first desideratum, recognition the second, and continuous patronage and continuity the third and real purpose to be accomplished. To attain what is regarded as success it is essential to build upon a foundation that will endure, and for this reason it is imperative that the lines dealt in be selected with extreme care.

No man cares to engage in what is even known to be uncertain as to outcome, and seldom it is that a man will undertake what appears to be a risk, especially when he has another choice. Men may be over-confident and take too much for granted, but the average individual will enter into business only after careful investigation of what he is to deal in and with at least reasonable knowledge of his line and knowledge of his probable trade.

It is evident that it is becoming more and more a problem for the man who is desirous of establishing himself as a representative, or handling the products of another, to select what will become a stable article of trade. This has been emphasized in many ways, but one of the most pronounced influences is the disposition of those producing under patent rights to protect themselves against imitators and imitations so far as this may be done through the medium of the law.

It is guaranteed to the owner or licensee by the issuance of a patent that a measure of protection shall be afforded, which is justification for organized industry and the exploitation of the product. The right of the patentee to the monopoly thus created has never been questioned or denied. Each person would not hesitate to benefit through the law, and there is no criticism when the penalties are imposed upon those who infringe upon it. It is true that the inherent desire to trade or economize dictates the lowest price obtainable for the buyer and the highest for the seller, but this is merely a matter of individual satisfaction and does not concern the masses.

The law exists and its protection is insured to all alike. Those who violate it must assume the consequences. The patent is based upon what must be regarded as good authority and is so accepted. Those who essay improvement or perfection must obey the legal requirements. The same restriction as to manufacture applies equally well to use, so that there is a responsibility shared by the distributors and the consumers, which seemingly has not been generally understood or realized.

Business ventures are not usually "get-rich-quick" propositions. This being so they must conform to and accept conventional methods. Public patronage as bestowed is with recognition of commercial conventions and these must be lived up to by the seller and buyer. Because there is willingness to embrace the fullest opportunities and the largest measure of privilege afforded by the patent law, and there is better realization of the benefits obtaining, is the more reason why there should be even extreme care in dealing with patented products.

There are recognized lines, many of which are standard in the market, and these are usually distributed with publicity that is productive of custom. The business man who deals with these has support in his endeavors that is far-reaching and he has reasonable assurance that he will be far more successful, both immediately and in future, for promotion by the producer must be proportionate to the demand. Neither is there a possibility that what has been created by conscientious and persistent work may be destroyed by conditions entirely beyond his control and by circumstances which his activities may have in part brought about.

SENSATIONALISM IN TRADE INTELLIGENCE.

Economy of Truth or Unfounded Comment to Inspire Fear the Weapon of Those Who Live by Wielding the "Big Stick."

Of utmost value and importance to the industries and commerce of the nation is dependable trade and industrial intelligence. One of the greatest of all modern business problems is the dissemination of information relative to those engaged in it. Public knowledge of an enterprise is its largest asset because primarily a demand must be created. Production is governed by the requirements of those who are informed and it may be adapted to any conditions. Sentiment is natural and is the strongest characteristic of human nature. It has material influence in shaping our lives, and often against our better judgment. Opinion is based by judgment of facts as we understand them. Sentiment has no actual place in industry or commerce, but opinion governs both. Primarily, facts must be reflected by mediums for public intelligence, and for this purpose the trade publications exist.

Because of the acceptance of the facts as published by those who have no better sources of information there is a responsibility among publishers that is extremely large. Public prints can accomplish vast good or cause great injury or damage by presentation of what may be accepted as authentic by those who read them. There are legal proscriptions which seemingly prohibit the publication of what might be regarded as directly or indirectly, intentionally or unintentionally, malicious or damaging. These restrictions differ in many states. It is probable that no laws are less understood than those relative to libel, and for this reason there is little public realization of the possible results of assumed occasions for redress.

Aside from the legal aspect there are moral and ethical restrictions that cannot be denied or evaded by those whom they concern, and these require that the information published should be facts, and facts that may be established beyond any possibility of doubt. This does not mean that what is generally known as promotive publicity should be rejected, because this serves a decidedly useful purpose, but it does mean that whatever will be misconstrued or misunderstood by the industry and trade should be verified or qualified. The reason for this is the natural tendency to comment and amplify and conclude and assume, to the injury of those who are the victims.

A rumor, a suspicion or an assumption may be seized upon as opportunity for trade sensationalism that cannot be otherwise than destructive. Actual facts when regarded without prejudice or purpose and fully understood may appear entirely different. It is not possible for any person responsible for the conduct of a publication to be fully informed as to concerns widely scattered, which are often written of without thought of the consequences when such writings are read and believed by those more or less interested.

Where there is possibility of erroneous information, and there is no attempt at verification, then the only conclusion that can be reached is that there is intent to mislead or unduly influence those who shall read the publication. Where there is economy of the truth, misrepresentation must at least be charged, and if there be comment that will create suspicion or loss of confidence there can be no other supposition than that actual injury has been attempted.

The results of statements published cannot be predicted. The reputation of a firm may be shattered, its credit may be impaired or its product discredited by the publication of what may appear to be a fact. The public does not wait for complete knowledge before judgment is given, and the effects are cumulative. The damage has been wrought and it cannot be repaired. Even in the event of no cause for speculation, and no occasion for comment, much time and great effort is necessary to restore confidence.

Business men, whose products are sold generally, and whose reputations must be maintained with much care because of their extended relations, are exceedingly careful to protect themselves against erroneous or misleading intelligence, and this condition seemingly makes possible the wielding of a "big stick" by those who might believe that fear is a more potent influence than actual merit of their publication in securing patronage. The sensation monger is a dangerous element in society, but he can destroy instead of smirch, and ruin instead of annoying when he attacks the legitimate business interests of many, perhaps through one firm or enterprise.

PROTECTING CELLULOID WINDOWS.

Some operators whose cars are not equipped with the glass type of windshield utilize the front curtain of the top for protection against the weather. These members are fitted with celluloid and many drivers cut small openings for the purpose of obtaining a clear vision of the road, and the practise is adopted more especially as rain or snow on the window obstructs the view.

Unless care be exercised in cutting the holes, the material is likely to be torn easily, especially when the member is rolled up and fastened to the top. Some fit a binding of leather around the edges of the aperture and cement it to the celluloid. A better method is to cut a ring-shaped strip of celluloid and attach it, which operation may be performed by making a solution comprising one dram of fine shredded celluloid dissolved in two ounces of acetate of amyl. This will create a thick, sirupy mixture and should be applied with a camel's hair brush. The material to be joined should be cleaned thoroughly, and the parts should be allowed to dry for several hours before using.

LENS MIRROR LAMPS AND BURNERS.

When one has disbursed a large sum for new head lamps provided with genuine Mangin mirror lenses of large diameter, it is very annoying to dismount and find both lenses cracked right through to their base. This is likely to occur if the lamps be fitted with burners which create a flat flame by the impingement of two jets of gas at right angles in the plane of the car's direction of travel, and actually befell the writer last week. It was partly his own fault, as the light had commenced to grow pallid, but as his destination was near he drove on stubbornly instead of stopping. Each burner was found to be choked from some mysterious reason, in spite of a new filter figuring in the gas circuit, and the front jet was directing a spear of flame right on to each mirror, with the inevitable result. Burners of a different type have now been fitted, and these cannot throw a spear of flame astern. —B. H. D. in Autocar.

Rust Preventative—To prevent rust, dissolve one ounce of camphor in one pound of melted lard, remove the scum, mix as much black lead with lard and camphor, as will give it an iron color, clean the machinery well, smear with the mixture, and after 20 hours rub off, clean and polish with soft cloth.

REMOVING STUCK WOOD SCREW.

A handy way to remove a wood screw that has stuck, and is so tight that there is danger of twisting off the head, is as follows: Heat a poker or a piece of round iron red hot, and hold it against the screw head for a little while. Wait a few minutes for the screw to cool off, when it will be found that the screw can be removed quite easily with the same screw driver that just previously would not perform the work. The explanation is simple. The red-hot poker heats the screw; the screw expands, and makes the hole it is in just a bit bigger. The screw then cools down and resumes its original size, leaving the hole in the wood a size larger. The writer has given this little kink a fair test in taking screws out of some oak boards that were built in a refrigerator where the wood had become set around the screws.

DRAINING THE PAN.

Cars not fitted with some method of draining the pans of the accumulation of grease or oil deposit lubricant while ascending grades and sometimes when entering the garage where the approach is at an incline. In addition to being unclean there is more or less danger where the shields are in this condition, because gasoline may gather as a result of the carburetor flooding and should the fuel catch fire it would be difficult to extinguish the blaze.

Removing Rust from Nickel—To remove rust spots from nickeled surfaces grease the rusty part well, allowing the vaseline or similar substance to remain for a number of hours, when it should be rubbed with a rag dipped in ammonia. This treatment will do away with most rust spots, but if any of these are difficult to remove, they should be carefully dampened with a little diluted hydrochloric acid and quickly wiped dry. The surfaces so treated should be washed with clean water, and when dry, rubbed with polishing powder.

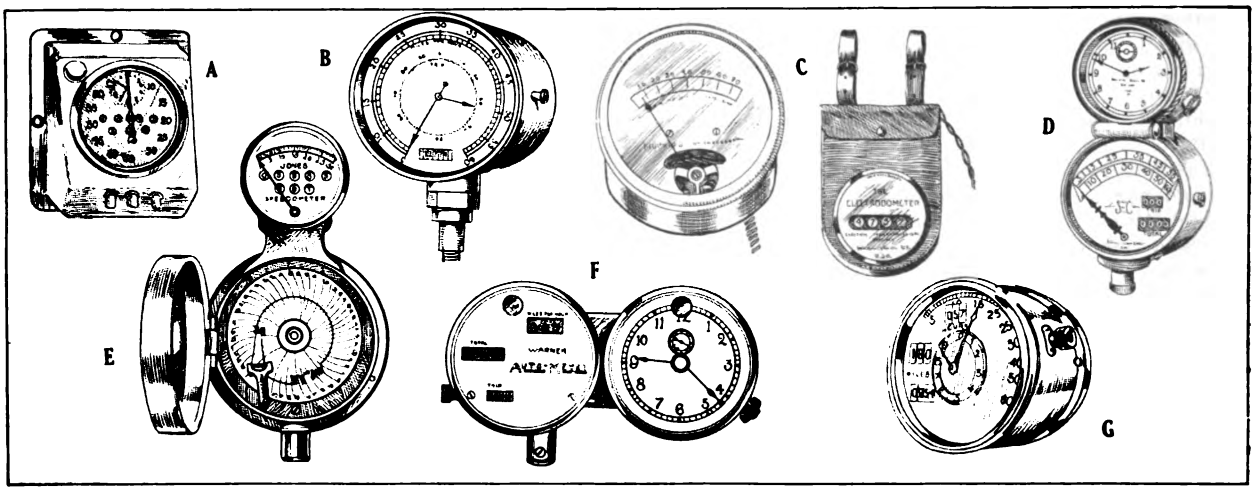
Hardening Reamers—Heat slowly and evenly to a bright cherry red, quench quickly and immediately immerse in a bath of linseed oil, holding the reamers vertically, and then draw the temper to a straw color, as for a tap or die.

ACCESSORIES AND APPLIANCES THAT SELL.

CONTINUING the discussion of prominent accessories from the last issue of The ACCESSORY and GARAGE JOURNAL, herein is set forth many of the leading makes of supplies and fittings designed for the proper maintenance of the car or the convenience and enjoyment of motoring. As has been stated, many cars are sold today with what is known as complete equipment, but in spite of this the purchasers often have occasion to add details which more nearly approach their ideals, and there are some so-called accessories which require renewal from time to time. In any event it is desirable to become thoroughly acquainted with the standard productions. The illustrations and brief descriptions below will serve to call more forcibly to mind those devices or supplies which have been most extensively exploited and therefore recognized as measuring fully up to the demands of the modern automobile.

SPEEDOMETERS.

The automobile owner who would comply with the requirements of the laws will find one of the most necessary equipments for his vehicle to be a speedometer, and these instruments have been improved and perfected in many ways. There is a very wide range of qualities and values in these indicators.



Speedometers: A, Stover-Lang; B, Reliance; C, Hopkins (Electric); D, Sears-Cross; E, Jones; F, Warner, G, Cleveland.

Stewart.

The Stewart, made by the Stewart & Clark Manufacturing Company, Chicago, Ill., is produced in numerous models and in combination with clocks suited for all purposes. The principle of operation is by magnetic influence. One feature is a provision for the regulation of some models by micrometer. Another is that the trip register may at any time be set to any tenth of a mile. Besides refining and improving the indicators, the shafts and fittings have been considerably perfected.

Jones.

Besides the standard Jones models, produced by the Jones Speedometer Company, New Rochelle, N. Y., which have been little changed, aside from the use of nickel and black enamel for case finish, the truck service types have been improved by heavier fittings. There is in addition the Jones hub odometer for service wagons and there is as well the Jones recorder, which will register the period of service, distance and speed, when the vehicle is in motion, duration of stops and driving, on a chart that may be removed and preserved for record.

Warner.

Made by the Warner Instrument Company, Beloit, Wis., the Warner is the pioneer magnetic instrument and has been so perfected that little change has been made in the 1912 models other than to install a reset for the trip register on the bezel types. This is designed for the benefit of those who desire to make deviations from routes and yet be able to employ the routed information without recourse to making notes.

Hoffecker.

The new instruments made by the Hoffecker Company, Boston, Mass., include model D, which has a 100,000-mile register and a trip register that may be set to zero at will by a side button reset, or to a tenth of a mile. Model H is a vertical type of combination clock and speedometer designed for use with cars of moderate cost. The other types have not been changed, save in minor detail.

Veeder.

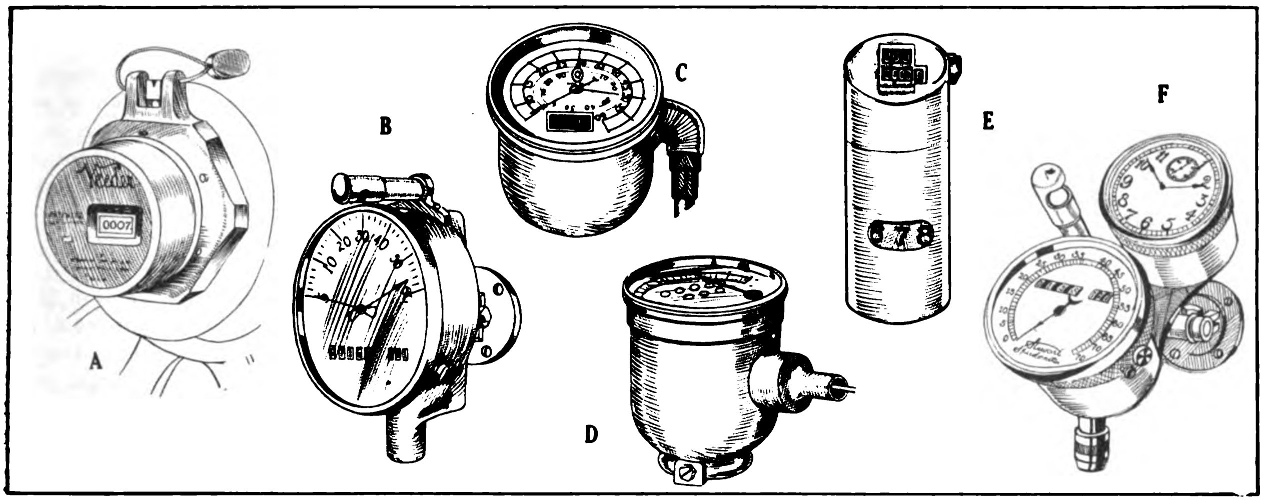
The Veeder indicator is made by the Veeder Manufacturing Company, Hartford, Conn., and with a tube containing colored fluid mounted in a metal frame carrying a scale. There is a reservoir for fluid and the momentum of a small centrifugal pump carrying this fluid upward into the tube indicates the speed of the car. There is a trip and season odometer, the assembly being operated by a flexible shaft from the vehicle wheel.

Forse.

Produced by the Forse Manufacturing Company, Anderson, Ind., this instrument has been improved by the change of the shaft opening to eliminate a turn in the flexible shaft. The type is centrifugal and the construction well designed, there being double ball bearings for the governor shaft, radial raceways and four point suspension. No springs are required for steadying the indicating hand. The drive is by a special cable of piano wire in a steel-lined brass tube.

Sears-Cross.

The 1912 model of the Sears-Cross, made by the Sears-Cross Company, New York, N. Y., is built with a double governor, the second functioning after a speed of 15 miles an hour has been reached, the one



Speedometers: A, Veeder; B, American Metric; C, Hoffecker; D, Forse; E, Casgrain; F, Stewart.

first used steadying the hand. The instrument as built is assembled within a case and this is installed within the housing. An odometer reset is a feature. There are six sets of ball bearings in the fittings.

American Metric.

Made by the American Eveready Company, New York, N. Y., these instruments are in 12 models and are of the magnetic type, the former centrifugal constructions being abandoned. They range from 50 to 80 miles an hour indication and vary in size and price. Besides these changes a swivel joint is now used at the steering arm and the flexible shaft has been decidedly improved.

Hopkins Electric.

This device, produced by the Electric Speedometer Company, Washington, D. C., includes a direct current generator geared to the vehicle wheel, a voltmeter, a commutator, an indicator, a revolution counter and an electrodometer. There are gold brushes for the commutator and the voltmeter, sapphire bearings and exceedingly accurate and careful construction. The electrodometer is for the use of the tonneau passengers. The record is of speed, distance, and travel in a given period.

Cleveland.

Made by the Cleveland Speed Indicator Company, Cleveland, O., this instrument is intended to register by indication speed averaged for each 176 feet of distance traversed, trip miles, actual running hours for the trip, average speed for trip or day, complete season's mileage, actual running hours for the season and average speed for the season. The indicator is a clock with registering device governed by a shaft driven mechanism, and it is self-winding.

Reliance.

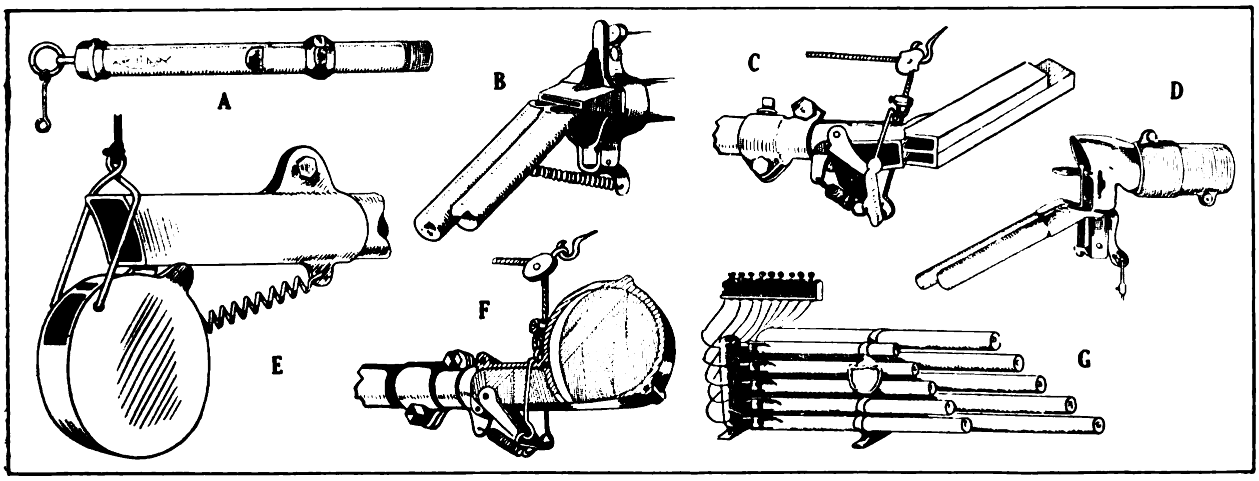
Produced by the Reliance Speedometer Company, Boston, Mass., extreme accuracy is claimed for these instruments through the use of a flexible driving shaft carried on ball bearings, which shaft has a swivel union at either end. All extreme movements of the indicating hand are eliminated by this shaft and mounting. The method of attachment is such that the driving pinion is always in the same plane as the ring gear on the vehicle wheel.

Casgrain.

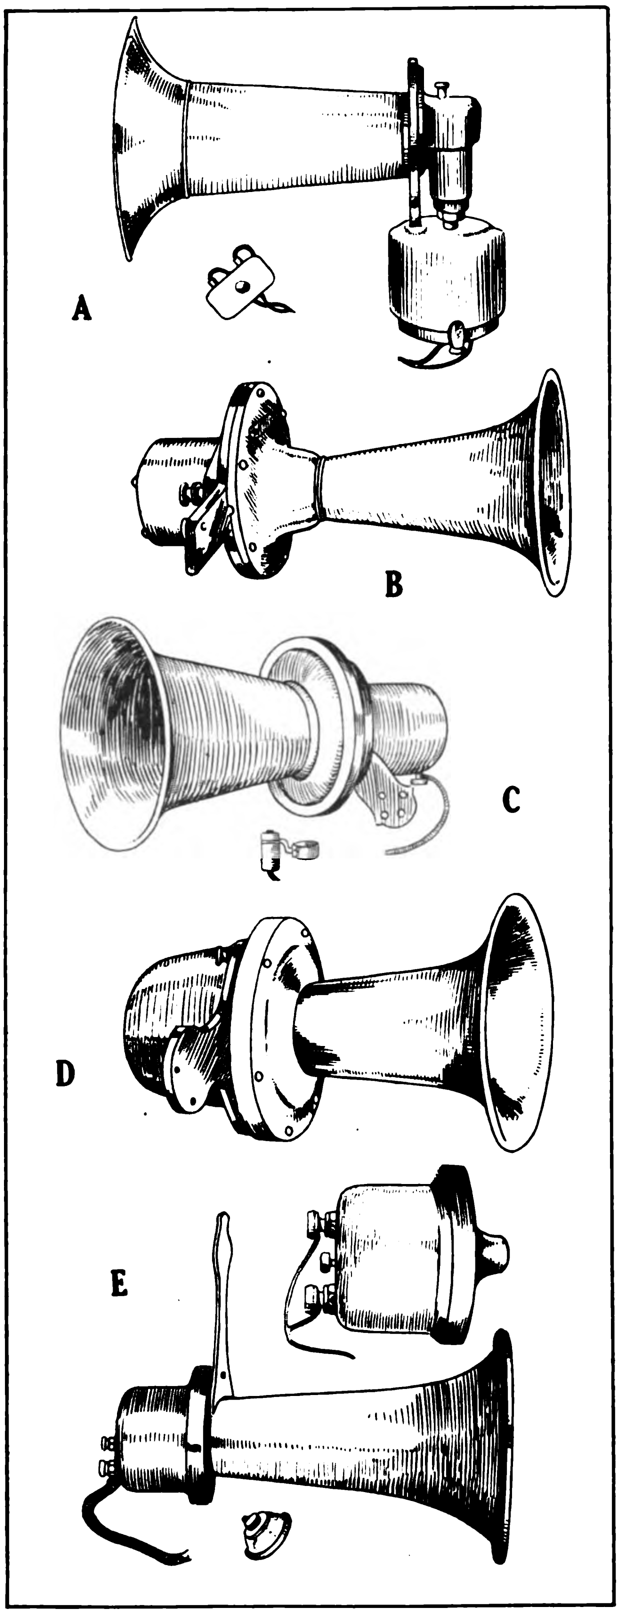
In this speed and distance indicator, made by the Casgrain Speedometer Company, Boston, Mass., the register is by figures carried on a cylinder that is actuated by the motion of the fluid contained within a sealed glass casing. The movement is by a rotary pump turned by a shaft driven by a flexible shaft from the front wheel. The device is carefully calibrated and as the shocks are cushioned by the liquid it is said that it is free of all influences that might in any way disturb its accuracy.

Troy.

The Troy Carriage Sunshade Company, Troy, O., produces the Troy pneumatic speedometer, which is actuated by an air draft forced through a flexible tube and which operates the indicating device. In a test, an instrument was driven 2508 hours at speed of 120 miles an hour, a total of 300,960 miles, and after this run by micrometer measurement no part showed measurable wear.



Exhaust Horns: A, Nightingale; B, Exo; C, Jubilee; D, Waymaker; E, Hough; F, Jericho; G, Gabriel.



Electric Horns: A, Klaxon; B, Oneita; C, Duplex; D, Hipwell; E, Typhoon, and Attachment for Bulb Horns.

Stover-Lang.

In the product of the Stover-Lang Company, Boston, Mass., the rate of speed, distance and time are recorded by a combination clock and recorder. A clock escapement is automatically wound by force of air driven through a tube every half-revolution of a wheel by a diaphragm. Every five seconds the wheel revolutions are counted and recorded. There are no springs, cams or magnets used in this device, which is claimed to be absolutely accurate.

HORNS AND SIGNALLING DEVICES.

While bulb horns are still offered, many concerns have turned their attention to the production of electrically or exhaust operated devices in addition to the older lines. Some of these present new shapes and designs, and taken as a whole the signalling situation has changed quite as much as any other in the so-called accessory field.

Sonora.

In the Sonora, made by the Sonora Motor Horn Company, New York City, the usual diaphragm has no button or stud riveted into the centre. Instead a little spring member beats against this drum head disc, producing a deep toned whistle. It is claimed that it may be operated an entire season on one set of batteries.

Newtone.

The Auto Supply Manufacturing Company, Brooklyn, N. Y., is featuring the Newtone Torpedo electric horn, in which the motor comprises a field of 75 laminated pieces. By the adoption of a vanadium steel diaphragm .03125 inch in thickness, it is claimed that the consumption of current has been reduced some 40 per cent. The same quality of construction is maintained in other members of the line.

Tuto.

The Dean Electric Company, Elyria, O., continues the Tuto horn, electrically operated, with which a button is attached to the steering wheel spoke, and the cord is encased in a fixture on the steering column. Pressing this button instantly causes the device to give forth a mellow note, while additional pressure brings about a more penetrating sound. An addition to the line is the Tutoette, a smaller replica of the Tuto, and a new bulb horn, known as the Tally-O-Horn.

Monoplex.

The Monoplex is made by the Atwater Kent Manufacturing Works, Philadelphia, being presented in three types, A and M for automobile service, and D for marine use. The operating button is clamped to the spoke of the steering wheel, and the principle of operation is that of a steel diaphragm being struck by an electro-magnetic mechanism. The sound thus produced is intensified by the bell of the horn.

Klaxon.

The product of the Lovell-McConnell Manufacturing Company, Newark, N. J., is almost too well known to need comment. Practically no change has been made in the Klaxon, but the Klaxonet is now offered as a combination instrument, which may be used as an electric device or as a bulb horn. For the first time the line is being offered in colors to match the cars on which the members are to be used.

Typhoon.

The Typhoon is produced by the Typhoon Signal Company, Chicago, and is a motor driven electric horn. The interior mechanism is new, and patent claims have been allowed, which the company holds is proof that it does not infringe upon any other device. In addition to the regulation Typhoon horn, the compartment containing the sound producing mechanism is furnished for attachment to the ordinary bulb horn if desired.

Hipwell.

An electrically operated horn, for which simplicity of internal mechanism is the prominent feature claimed, is the Hipwell Autophone, made by the Hipwell Manufacturing Company, Pittsburg, Penn. All working parts are sealed and water proof. Operation is by push button on the steering wheel.

Oneita.

The Mutual Auto Accessories Company of America, New York City, is placing in the market the Oneita electric horn, for which it is claimed that it has a tone 50 per cent. louder than usual. A large hammer vibrator is used, striking a 5.5-inch diaphragm, which, due to the peculiar construction of the casting, is held under considerable tension and causes the deep, clear tone. This casting is of solid brass, absolutely water and dust proof.

Duplex.

The Electric Auto Horn Company, Pittsburg, Penn., makes the Duplex, which operates from either the regular ignition or lighting battery, six-volt storage or six dry cells. The construction is held to be so simple as to present nothing to get out of order. With each horn is furnished a special steering wheel push button and three-way cable for connecting.

Jericho and Jubilee.

The Randall-Faichney Company, Boston, Mass., continues its Jericho exhaust horn with practically no change. This is installed in the rear of the muffler, either by clamping over the muffler stem by a double clamp coupling, or by screwing into the muffler by a threaded coupling. A simple pressure of a pedal gives a pleasing tone, clear and distinct, at any speed without racing the motor. This concern also makes the Jubilee, a chime horn, operated in the same manner as the Jericho.

Gabriel.

The Gabriel Horn Manufacturing Company, Cleveland, Ohio, has brought out a new form of its 10-tone Gabriel musical horn. Heretofore, this well known signalling device has been designed primarily for use on high powered cars, but the new instrument enables the owner of a 30-horsepower machine to utilize one of these as well. The line also includes musical signals of one or more notes, all operated by the exhaust.

Long Horn.

The G. Piel Company, New York City, produces the Long horn, operated by hand. Any volume of tone desired is said to be at the command of the operator, a sonorous and penetrating note being obtained instantly. The weight of the Long horn installed complete is about five pounds, which is cited as of special importance in selecting such equipment.

Clymax.

The Nonpariel Horn Manufacturing Company, New York City, presents the Clymax, an electrically operated signalling device. Within the rear end portion is placed a small electric armature, which a flow of electricity causes to rotate and drive forward four striking points, which hit the metallic diaphragm at three spots, set 120 degrees apart around the circumference. The point is that the action is not a continuous hammering on one place, but with this distributed over a series of places.

Exo.

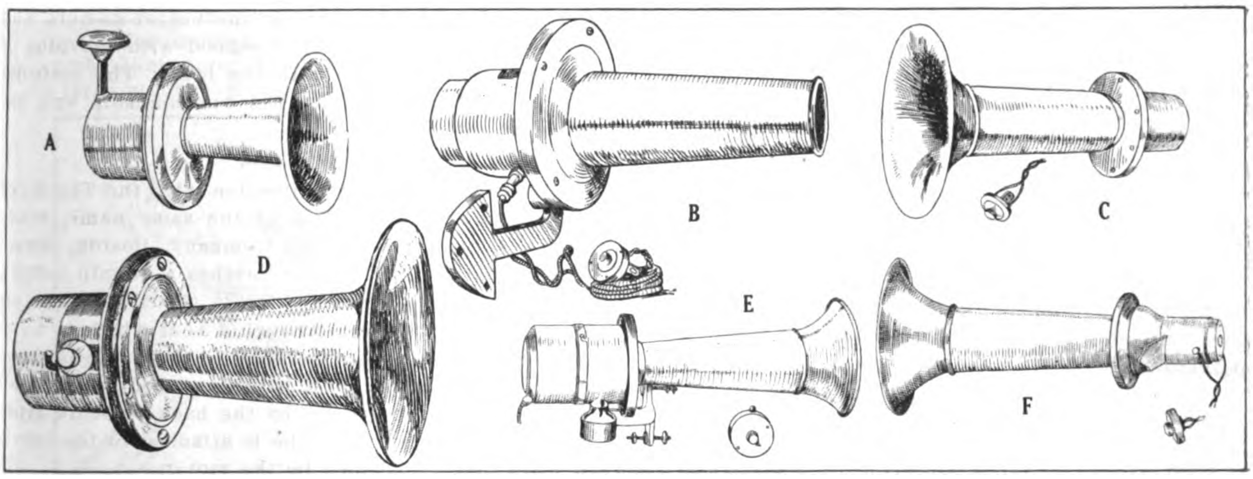
The Troy Auto Specialty Company, Troy, N. Y., makes the Exo, which is a double-toned exhaust horn, attached at the rear of the muffler. When in use the exhaust gases pass through the two pipes, giving forth a clear, well defined note. A spring pulls it back out of the way, when not in use.

Waymaker.

The Lee Tire & Rubber Company, Conshohocken, Penn., produces the Waymaker, a double-toned instrument operated by the exhaust. When brought into use by the depression of a pedal the exhaust gases are deflected by means of a centrally located valve, being thrown through a thick slot immediately across the ends of the chime tubes.

Nightingale.

The Nightingale whistle is made by the Riley-Klotz Manufacturing Company, Newark, N. J. This is an exhaust device, connected at the rear of the muffler, where it causes no back pressure and operates as well at low as at high speeds. The interior is designed so as to present a chromatic scale of bird-like notes.



Electric Horns: A, Long Horn; B, Newtone; C, Sonora; D, Monoplex; E, Tuto; F, Climax.

Hough.

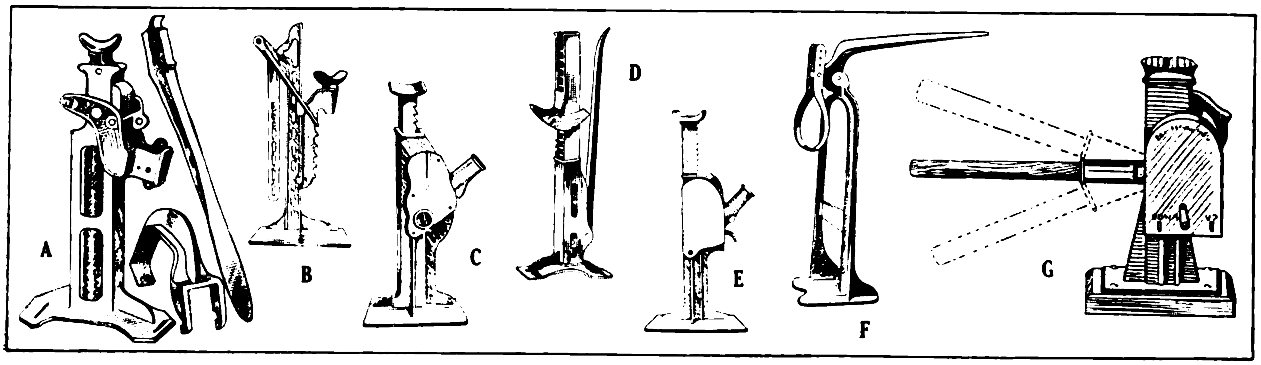
The Auto Improvements Company, Bristol, R. I., presents the Hough exhaust whistle, designed primarily for use on model T Ford cars. It is attached easily and quickly to the rear of the muffler by means of a tapered tube, which is split at one end and locked by a threaded bolt and nut. The other end fits over and partially closes the opening of the drum member.

JACKS.

One of the tools which are indispensable around the garage is a jack. Several forms have been in the market for a number of years and still continue to offer as good service as when they were originally brought out. A few new designs have been produced.

Hartford.

The Hartford Auto-Jack is produced by the Hartford Suspension Company, Jersey City, N. J. It is claimed for it that a pressure of 15 pounds on the handle will lift 1000 pounds on its rack. Gears, cut



Jacks: A, Peerless; B. Reliable; C, Miller; D, Oliver; E, Buckeye; F, Moore; G, Hartford.

from steel and hardened, ingeniously arranged, wonderfully multiply the little power applied to the long lever with its short stroke.

Raiswell.

The Raiswell, made by the Lovell-McConnell Manufacturing Company, Newark, N. J., has its entire mechanism enclosed in a neat housing, this being a series of gears. The only exposed portion is the thumb wheel on which fits the brace bit designed for turning these gears and lifting the load.

Barrett.

Barrett jacks, made by the Duff Manufacturing Company, Pittsburg, Penn., may be regarded as standard for motor car use. They come in four sizes, designed for light and heavy cars, trucks and general garage work. The construction is simple and compact, and the various models are as light as consistent with the work for which they are intended.

Oliver and Peerless.

The Oliver, made by the Oliver Manufacturing Company, Chicago, has a straight lift of 1.5 inches and locks by passing the centre. The bracket slides up and down on a standard and is instantly adjusted to any height. The same concern makes the Peerless, which not only is smaller in size but may be utilized in removing the tire from the wheel, by placing the bracket between the spokes of the wheel and using the handle as a tire tool.

Miller.

The Miller, produced by Chas. E. Miller, 97-103 Reade street, New York City, is a quick acting, automatic lowering jack, designed especially for automobile use, and is adapted to the factory or garage, as well as being so arranged as to be carried as a part of the regular car equipment. The construction is of the best material and every part is machine finished.

Reliable and Ideal.

The Reliable is made by the Elite Manufacturing Company, Ashland, O. With the Ideal, produced by the same concern, this line is fitted with swivel tops to permit of their being set in the most convenient position for operation. They are strong, compact and small, occupying very little space in the tool box, and yet large enough to do their work well.

Moore.

While J. C. Moore & Co., Racine, Wis., has brought out a full line of Moore lifting jacks, suitable for every class of automobile work, the new tire saving jack of this name is of particular interest. The loop is placed over the hub, and the handle pushed down until the car is lifted to the desired height.

Buckeye.

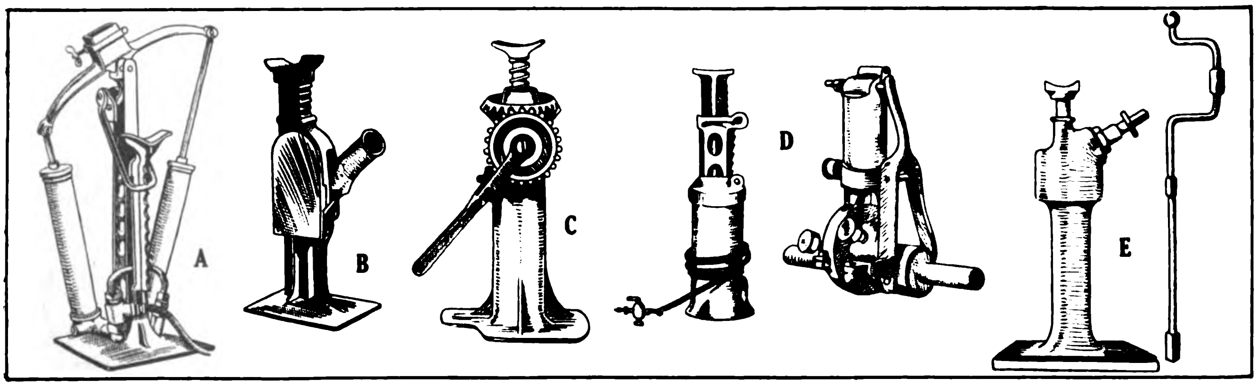
The Buckeye Jack Manufacturing Company, Alliance, O., is making a full line of Buckeye automatic jacks, which are intended for the use of owners who desire a safe, reliable tool, designed with the idea of not being able to drop with the load. The material is drop steel forgings, and the workmanship and finish is of the best.

Ten Eyck.

Designed for use in connection with the Ten Eyck tire pump, the lifting jack of the same name, made by the Auburn Auto Pump Company, Boston, Mass., is regulated so that when it reaches a certain height, the control valve of the pump is closed and the air from the pump escapes through a vent which is automatically opened. The operation of the pump is automatic, the driving clutch being engaged by a small piston which is forced up by the back pressure from the tire, the instant the tube is attached to the valve. Of course, it is operated by the motor.

Warner-Service.

Another combination jack and pump is the Warner-Service Jackpump, made by the Warner-Service Manufacturing Company, Jersey City, N. J. It is claimed that this device will lift the car three inches off the ground with one stroke of the lever. Connected with the jack are two high pressure compound pumps capable of delivering 60 cubic inches a stroke at a pressure of a 150 pounds. These cylinders are made of special heavy gauge seamless brass tubing, and the jack, yokes and levers are of the toughest malleable iron.



Jacks: A, Warner Service and Pump; B, Barrett; C, Ideal; D, Ten Eyck and Pump; E, Raiswell.

MECHANICAL POINTERS for GARAGEMEN AND OWNERS

DOUBLE IGNITION ON A PLUG.

A method of using two separate ignitions on one plug is shown in Fig. 1 A, and the device is easily made and not expensive. It consists of two resistance spark gaps mounted on a fibre base which is placed on the terminal of the sparking plug. The gaps are adjusted about five times that at the plug points, which can be very small, as the resistance of firing gas under compression is, approximately, about four times as much as atmospheric pressure, so that the spark will choose the path by the way of one resistance gap and the plug points, rather than by the two resistance gaps, and back through the other high-tension winding. The spark from either magneto or storage battery ignition will not be weakened appreciably by the extra gap, as no trouble is found with two plugs, one a double pole, in series.

BATTERY TERMINAL PROTECTOR.

Although the storage battery is not used so commonly for ignition in connection with the internal combustion motor as formerly, it is still employed by a large number of cars for that purpose, as well as for lighting. Terminals of this type of battery give trouble as they corrode, especially if the owner does not give them proper attention. A device that will not only aid in preventing the corrosion of these members and wires as well, but also prevent possible short circuits, is shown in Fig. 1 B. It consists of a piece of rubber hose through which the wire is passed and after the cable is attached to the terminal the rubber is slipped down over the terminal.

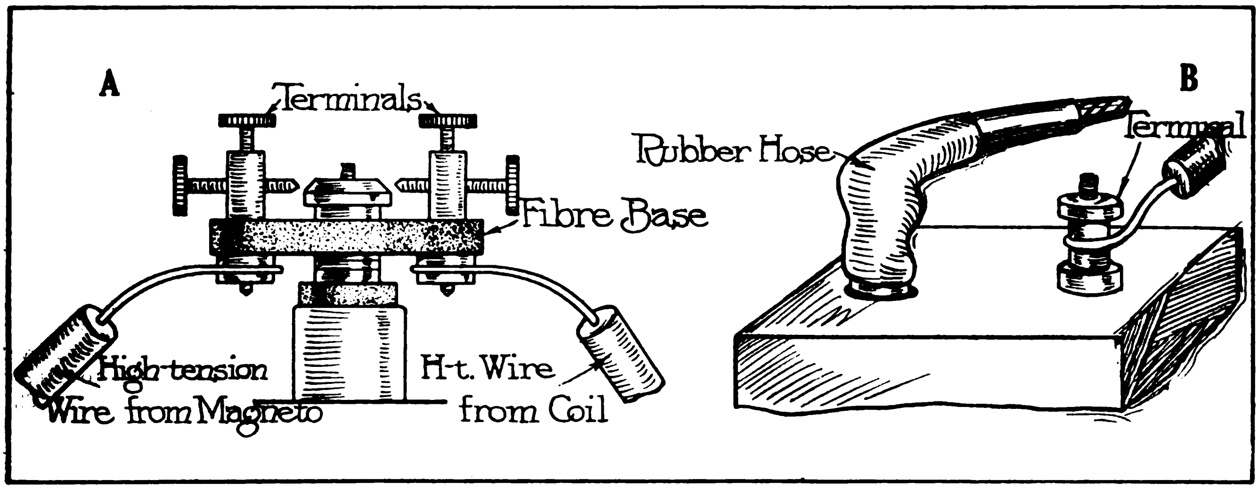


Fig. 1—Some Ignition Hints: A, Double Ignition on One Plug; B, Storage Battery Terminal Protector.

MAGNETIZED PLIERS.

A pair of ordinary pliers, the ends of which have been magnetized, are very useful and should be included in the tool kit. The expense attached to having the tool magnetized is very slight and any electrician can do the work. The pliers will be found very handy when extracting cotter pins and other small parts which will have a tendency to stick to them even if the grip be slightly relaxed. Another device of this nature which is handy around the garage is a piece of drill rod .125 inch in diameter, the end of which is magnetized. Sometimes in drilling blind holes there is difficulty in cleaning out the drillings which often means broken drills. By use of the magnetized rod the drillings can be removed. The tool can also be utilized for picking up small parts that have fallen into places apparently inaccessible.

AN EMERGENCY FILE.

A motorist who had occasion to replace a taper pin while on the road, discovered to his dismay that the tool kit did not include a file. The pin was slightly large and it would not do to force the member by driving. Having some emery cloth, the automobilist placed a strip about an inch wide on a flat piece of wood, with the emery side facing outward. Not having tacks or nails to hold the cloth, he cut a notch at either end of the stick, and by means of wires, held it in position. With this home made file he smoothed the taper pin to the required size, effecting his repair.

LOOSE SWITCH CONNECTIONS.

Loose connections in switches will cause skipping of the motor that is sometimes puzzling to locate. This is particularly true of that type of switch with the kick throw, that is, where the operator shifts the switch by means of the foot. This method imposes a strain upon the device which loosens it. It is a good plan to remove the switch occasionally and tighten the connections.

RADIATOR CAP REPLACEMENT.

While radiator caps are not often lost they sometimes are jarred loose by the vibration of the motor and if not attended to fall off and are lost. A road replacement can be effected by the use of a piece of chamois and string or wire. The chamois should be cut slightly larger than the diameter of the cap, placed over the radiator opening and the string or wire wound snugly around the ends.

WATER IN GENERATOR.

Certain types of gas generators give trouble, which is due to water in the tubing. The tubes should be blown out with the tire pump. It is a good plan to disconnect both the generator and lamps before cleaning the tubing.

SLIDING RING VALVE ENGINE.

A slide valve engine of ingenious design and extreme simplicity of construction, known as the Reno and of French origin, is shown at Fig. 2. The valve gear is in the form of a split ring H fitting closely in the cylinder and provided with a bearing block which is engaged by the rocking lever J, this in turn being actuated by the tappet K. The tappet is raised and lowered by means of a short bell crank, one leg of which engages the tappet and the other the double face or channel cam carried on a camshaft parallel with the crankshaft. To allow the rocking lever J to pass into the cylinder a slot is provided in the latter, which is always covered by an extension of the ring valve whatever the valve position. The split ring valve in its travel moves over the annular chambers L and M, which are cast in the cylinder wall and form the inlet and exhaust ports respectively, these being in communication with the inlet or exhaust openings E and F.

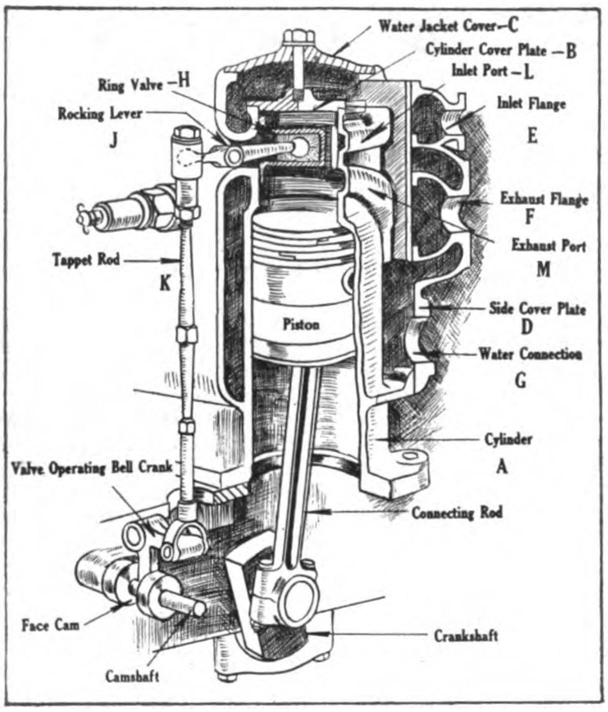

Fig. 2—Part Sectional View of the Reno Sliding Ring Valve Engine.

The diagrams at Fig. 3 show the valve in the induction, compression, firing and exhausting positions. The inlet port is designated by A, the exhaust passage by B and the ring valve by C. At 1 the inlet ports are uncovered, and the gas is entering the cylinders. At 2 and 3 both ports are closed by the valve while at 4, the exhaust is open. The principal parts of the engine are clearly depicted in part sectional view Fig. 2. A is the cylinder casting with the detachable head B, the central bolt of which holds the water jacket cover C. The side plate D carries the inlet union and chest E and the exhaust trunk and union F, also the water connection G. This valve system has been tried with satisfactory results on a four-cylinder car engine with a bore of 3.4 inches and a stroke of 5.2 inches. During the bench test this developed 28 horsepower at 1350 revolutions a minute, which was found to be its most efficient speed, and it was accelerated during the test up to 2200 turns a minute.

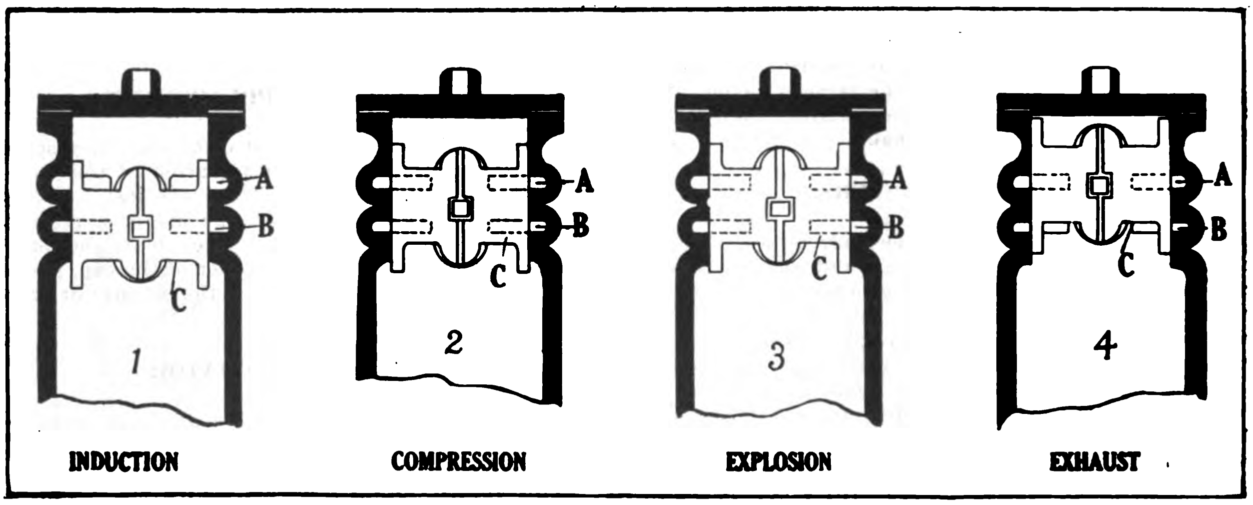

Fig. 3—Diagrams Illustrating Position of Sliding Ring Valve During Various Portions of the Cycle of Operations.

AIR IN WATER CIRCULATION.

One of the causes of the motor overheating is the water circulation system. An instance of this kind was noted recently by an owner who was at loss to account for the trouble as he had a few minutes previously refilled the radiator. The motor began knocking and became exceedingly hot, while the radiator was cold. It developed that there was an air pocket. The petcock on pump was opened and engine started. Circulation was restored after which the radiator was refilled.

Care should be exercised in adding water to the radiator. It should not be added before it has sunk low enough to expose the tops of any of the tubes. If the level be lower than this, the incoming water creates and imprisons a pocket of air in one or the other of the many narrow tubes in the system. It is natural to expect that the rush of water from the pump would force this pocket of air up into the space beyond the tubes in the radiator, but it often fails to do so.

If a replenishment is necessary, and the level of the water is below the tubes, the best method is to open the petcock at the lowest point of the circulation system, and drain off water, and continue to do so until a steady stream is pouring, to prove that the circulation is clear. It is then safe to add water and restart the motor.

Cutting Off Steel Shafts—The following little kink may be appreciated by many machinists who have had more or less trouble when cutting off steel shafts. By simply turning the cutting-off tool upside down, and running the lathe backward, it is possible to almost entirely eliminate any digging in of the tool. This method will be found to be far superior to the ordinary method of cutting off stock. Of course it works to better advantage when using a cutting-off tool. It is necessary that the lathe be reversed, or, if the cross-slide permits of the tool being placed on the opposite side of the lathe in the rear, then the reversing is unnecessary.

SIMPLE VALVE TRUING TOOL.

When overhauling gasoline engines, one of the essential operations invariably performed is truing and grinding the valves. If the valve heads are scored or have ridges in them, it is necessary to smooth the faces in contact before grinding to obtain a perfect seating, because the abrasive will get into the ridges and only intensify them instead of reducing them as is necessary. The valves are usually placed between centres on a lathe and driven at high speed, the high spots being turned off by taking a light chip off the face with a regular turning tool, or the roughness may be eliminated by using a file or piece of emery cloth if the grooves are not too deep. This operation should be performed only by a skilled mechanic however, and makes it imperative that a lathe be utilized. The valve seat must be trued to the same angle as it was when new in order to correspond to the seat in the cylinder.

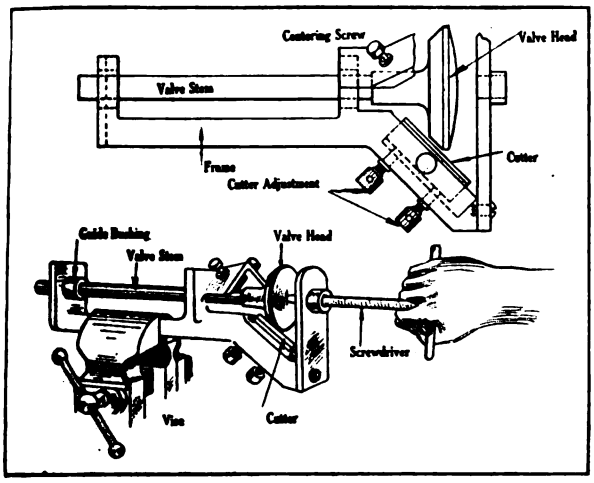

Fig. 4—Sargent Valve Truing Tool and Method of Application.

The simple tool shown at Fig. 4 is one recently patented by Allan Cameron Sargent, Lowell, Mass., and has been devised to make it possible to true up valve heads by hand. It consists of a forging or frame of metal having guide pieces for the valve stem and also acting as a support for the adjustable cutter against which the valve head is pressed and revolved by a screw driver or other suitable tool. Centring devices are provided and any size valve can be accommodated. The end piece that serves as a guide for the screw driver is removable to allow the valve to slip in place. Bushings may be provided so different diameter valve stems can be accommodated in the guide pieces. The cutter can be adjusted so the angle will conform to that of the valve head to be trued. The parts of the device are clearly depicted in illustration as well as the application, and the simplicity of the tool and the ease with which it may be used are apparent.

AN EASILY MADE EMERY GRINDER.

The equipment of the small repair shop or the private garage need not be costly and many useful tools and appliances can be made at very small expense by the motorist of average mechanical ability. J. D. Hopper describes an efficient and cheaply constructed emery grinder in the American Blacksmith. This utilizes odds and ends and which is not difficult to make, yet which would be of obvious utility to the man making his own repairs. His instructions follow:

"Take an old bicycle (drop frame preferred) and saw off top bar just in front of seat post. Saw lower braces about eight inches in front of hanger. Place it in a wooden frame and fasten as shown in the engraving. Take the rear hub and babbitt it or otherwise fasten it in the hub of an old cultivator, or similar wheel. This wheel must, of course, have a flat face for the belt. A wheel 30 inches in diameter can be used in most cycle frames. This wheel serves both as pulley and flywheel. The cycle should be geared about 66 to 70 to get proper speed for six-inch emery wheel. Place the wheel in the frame same as cycle wheel and use original pedals, cranks, hanger and chain.

"The emery stand may be bought or made from pipe fittings as previously described. By studying the engraving it can be easily seen how to complete this

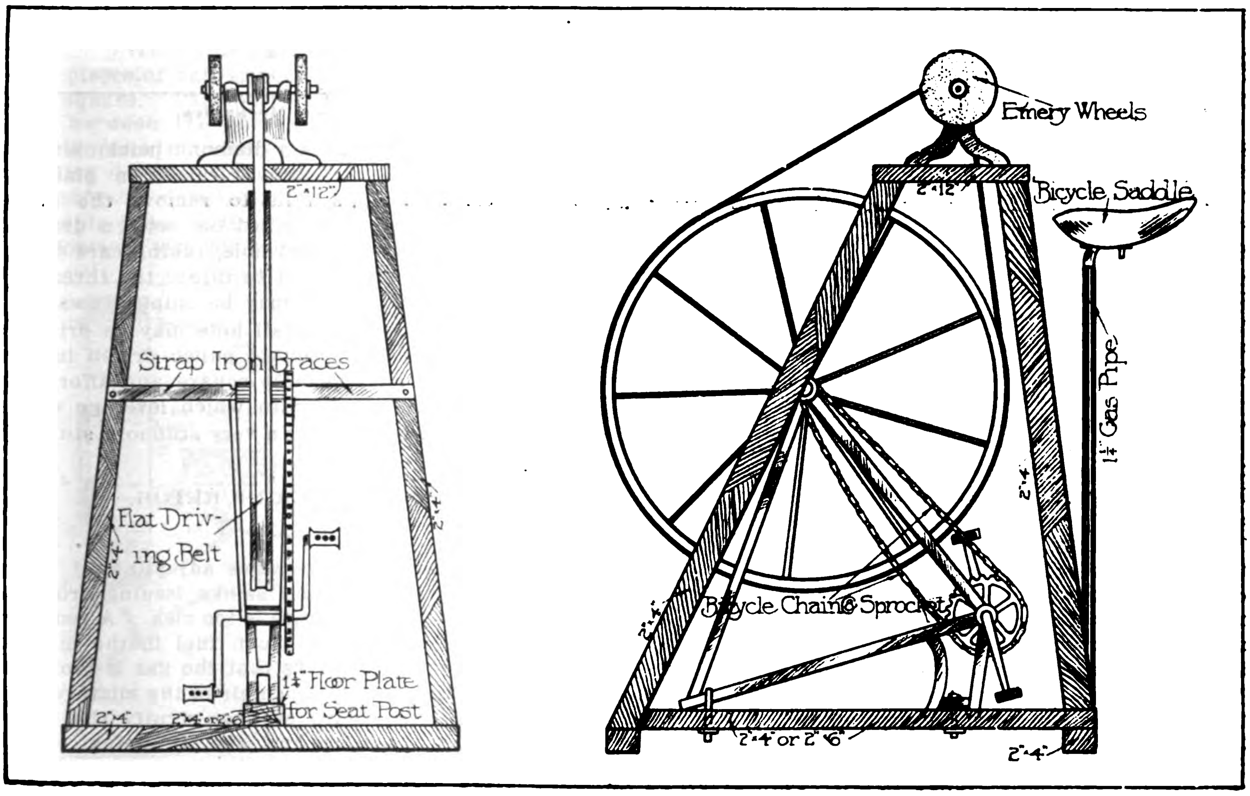

Fig. 5—How a Portion of an Old Bicycle Frame and Some Scantling May Be Converted Into a Power Emery Grinder.

machine, which will prove to be more efficient than any factory made machine on the market. I have used mine continuously for four years, and it has never been out of order."

SOME THREAD CUTTING KINKS.

The repair man often has occasion to cut left hand threads in nuts or on bolts and it sometimes happens that a left hand tap or die is not available at the moment. A right hand tap can be used to thread a rod to make a bolt or for tapping a nut with a left hand thread by observing a few simple precautions. The illustration at Fig. 6 A shows how to thread a rod with a right hand tap so it will act in the same way as a left hand die. Two holes are drilled in a piece of hard wood in such a manner that they cut into each other, the size of the hole being equal to the diameter of the piece to be threaded. The tap is screwed into one and held rigid, the other serves as a guide for the bolt or rod upon which the threads are to be cut, causing it to bear against the outside cutting edge of the tap. By turning the rod in a left hand direction a left hand thread will be cut, both the pitch and cutting edge of the tap being true enough for this purpose. Parallelism of threads will depend on operator.

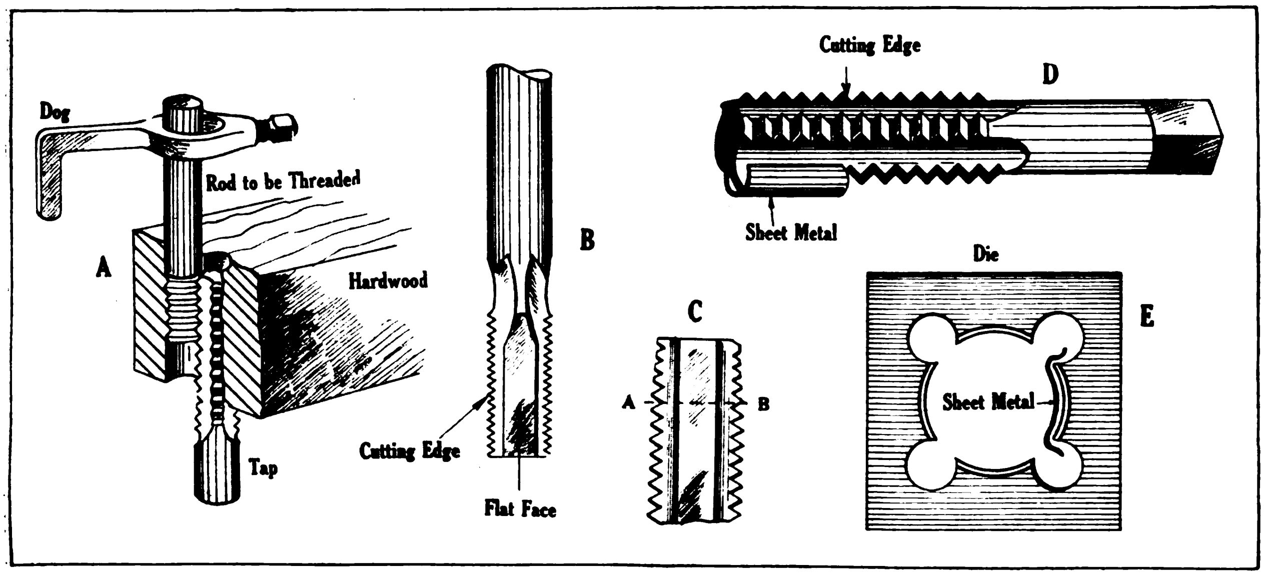

Fig. 6—Illustrating Simple "Kinks" on Thread Cutting Used by Practical Mechanics.

When the tap is to be employed in tapping out a nut, the alteration shown at Fig. 6, B and C, is necessary. A four-fluted right hand tap is changed into one having but two cutting edges by grinding off two of the flutes. On considering the remaining two cutting faces, it will be seen that the point of the thread on one side is on a line with the bottom of the thread on the other. This form of tap will cut either right or left hand threads depending upon the direction of rotation. Steel and brass, as well as cast iron, have been tapped successfully by this method.

After a nut is tapped, should it prove too small for the bolt it is intended to fit, it may be easily made larger. A small piece of tin is placed over the end of one of the flutes of the tap, as shown at Fig. 6 D. The tap is "run through" again and it will be found that the piece of tin crowds the tap to one side and cuts a considerably larger hole than before. If the nut should not prove large enough, another piece of sheet metal may be placed over the first one, which has assumed the contour of the threads.

If a solid die is used in cutting a bolt and the threads prove too large to fit the nut, a piece of light sheet metal may be formed and placed over one of the cutting faces, as shown at D, its function being the same as on the tap, namely, it forces the cutting edge opposite the piece to cut deeper.

GAS FILTERS NEED ATTENTION.

Some cars have a filtering device interposed between the fuel tank and carburetor. Its object is to catch dirt and water that may be in the gasoline. Filtering gauzes are also placed in the fuel pipe near the carburetor and these become clogged with sediment which results in the carburetor being starved of fuel.

It is a good plan to open the drain cock, of the filter near the gasoline tank occasionally and drain out all sediment and water, and continue to do so until clean gasoline appears. The filtering gauze near the carburetor should also be cleaned.

REMOVING BROKEN STUD.

The work involved in removing a broken stud is difficult enough when there is a bit left above the surface to afford a hold, but when the stud is twisted off flush with the top of the hole, the difficulties are increased proportionately. The best way to extract it is by making a slot across the face of the bolt with a cold chisel and use a screw driver to unscrew the offending part. If it is too firmly seated to yield to this treatment, the metal surrounding it may be heated and the stud well lubricated with kerosene. Then, tap close to the edge with a diamond point chisel and hammer, and the stud, unless rusted in place will usually turn. If this fails to remove the broken stub, it will have to be drilled out with a drill just the body size of the tapped hole, taking care to bore only in the centre so as not to injure the thread, the thin shell then remaining may be chipped away with a small cape chisel. A small hole may be drilled in the centre and a taper square punch driven into the stud, broaching out the hole square and affording a good grip for a wrench, with which leverage enough can be obtained to turn out a very stubborn stud.

ADJUSTING CARBURETOR.

When a carburetor requires adjusting, it should be remembered that black smoke issuing from the muffler indicates the mixture is too rich. A red flame also denotes there is too much fuel in the mixture, while a yellow flame shows that the gas is too weak, that is, that there is too much air in the mixture. Blue flame and a clear sharp exhaust signify the proper proportions of gasoline and air are being burned. Backfiring in the inlet pipe is also a symptom of weak mixture while a rich gas is sometimes indicated by explosions in the muffler.

MAKING PATCHES STICK.

The usual method of procedure after a puncture is to replace the defective tube with a perfect member. Sometimes the supply of extra tubes becomes exhausted, a not uncommon occurrence in touring. The motorist is then required to resort to patching the tube, which repair frequently is not effective due to haste in applying the patch before the cement is dry.

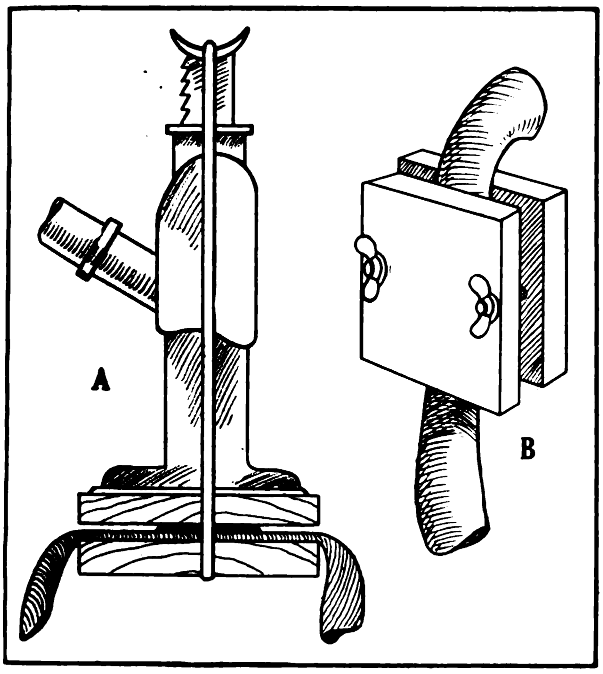

Fig. 7—Suggestion for Patching Tubes: A, Utilizing Jack to Secure Pressure; B, Home Made Tube Vise.

A certain length of time should elapse between each coat of the cement and the final coat should be allowed to dry thoroughly. Various methods of hastening the drying process are employed. It is essential that the patch be securely set before replacing the tube in the casing.

In the illustration appended herewith is shown a device for pressing the patch to the tube. It consists of two pieces of flat, smooth board about four or five inches square. That part of the tube with the patch is put between the boards, over which is placed a jack. A piece of wire or rope is then passed over the lifting device of the jack and carried down under the boards, as depicted in Fig. 7 A. By raising the jack ample pressure is secured.

A form of vise for the same purpose is shown in Fig. 7 B. It is made easily by taking two pieces of wood with smooth surfaces, about .5 inch thick. These members should be about five or six inches square. Holes are then bored, .375 inch in diameter, and two bolts, two inches or more in length, with nuts, preferably wing nuts, are used to draw the boards together after the tube is inserted as shown in the illustration.

USEFUL HINTS FOR REPAIRMEN.

It is not always easy to remove a key holding a flywheel or gear in place, though if it is a gib, as shown at inset in A, Fig. 8, a simple hooked member made of steel may be utilized as indicated. The hook, which has a rounded back, is placed between the head of the key and the hub of the wheel or gear, and a few blows with a hammer upon the other end are sufficient to start the key. The puller is made of tool steel, its size will depend upon that of the key to be removed. The method of pulling a key is also shown.

Protection for the speedometer driving gears is the object of the arrangement shown at Fig. 8 B. It is evident that there is considerable mud thrown on the mudguards from the tires and that drippings will get on the gears, causing rapid deterioration. The guard consists of an aluminum, brass or sheet iron cup that encloses the gears, and prevents deposits of mud accumulating between the teeth, as well as keeping small stones from being thrown between them and damaging the driving or driven member. The guard is easily made and attached and is adaptable to almost any make of car.

No class of workmen has the same difficulty in keeping hammer heads on the handle as those engaged in motor car repair work, or in general metal working. The constant jar of the head striking a non-yielding material inevitably loosens the wedge, which gradually works out and permits the hammer head to work off the handle. This tendency can be easily overcome by drilling a hole in the head, about .1875 inch in diameter, as shown at Fig. 8 C, and using a wooden wedge. Slot the handle for the expanding member, and after it is driven in tight, put an ordinary wood screw through. If a metal expander is used, it can be driven in place, and the hole drilled to include it as well, and the screw passed through into the handle just as though a wooden wedge was employed.

To temper knife blades of thin steel without warping, lay the blades between two pieces of iron, bolt together and heat to a cherry red, cool in rain water and draw temper by dipping the back of the blade in hot lead until you get a dark stone color on the edge, then quench.

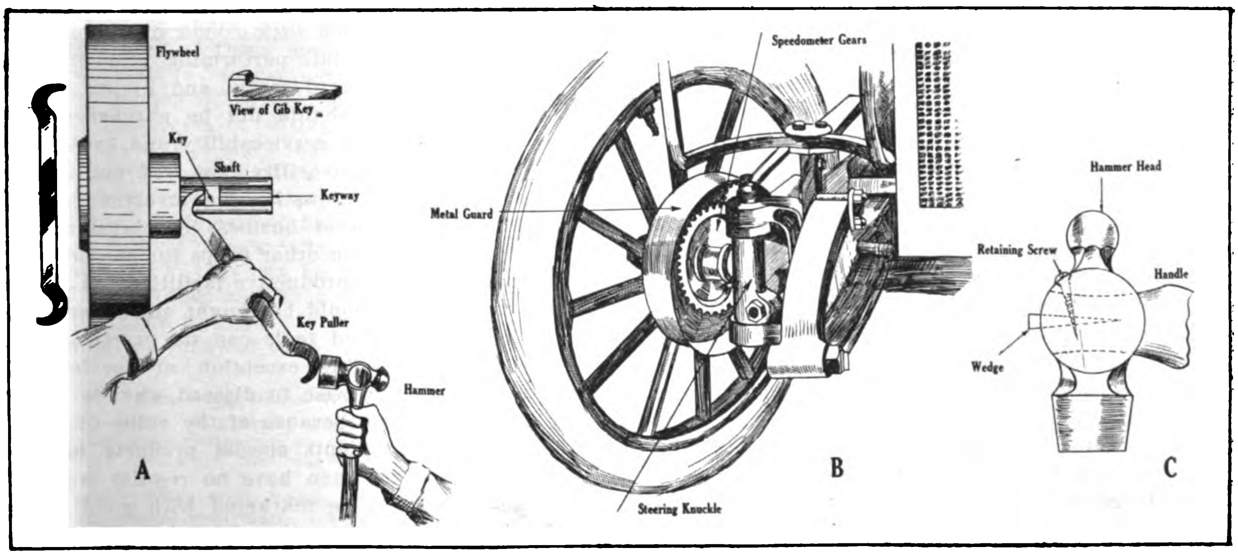

Fig. 8—Helpful Suggestions for Practical Repairmen Which Are Also Useful to Motorists.

THE ACCESSORY —AND— GARAGE JOURNAL
Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. I. MARCH, 1912, NO. 5.

AUTOMOBILE JOURNAL PUBLISHING CO.
Times Building, Pawtucket, R. I.
Publisher of
THE AUTOMOBILE JOURNAL THE MOTOR TRUCK

PUBLISHED THE 15TH OF EACH MONTH.

SUBSCRIPTIONS:
The United States and Mexico, the year, **$1 in advance;** Canada and Foreign Countries in Postal Union, the year, **$2 in advance. Fifteen cents** the copy.

CONTRIBUTIONS:
Anonymous communications not considered. Correspondence on subjects relating to the motor industry and the trade will receive attention. Stamps must be enclosed to insure return of unsolicited contributions.

ADVERTISING:
Information supplied at request.
Advertising Copy for the ACCESSORY and GARAGE JOURNAL requiring submission of proof must be received by 5th of month to insure publication in issue of the 15th of month.
Advertising Copy, proof not required, accepted to morning of the day before publishing day (unless such day is Sunday or holiday, when previous day is limit) of each publication.
Remittances should be made by Check, Draft, Postoffice or Express Money Order, or Registered Letter. Money enclosures must be at sender's risk.

STANDARDS OF SPECIFICATIONS.

The makers of pleasure and service vehicles assume to give those interested detail relative to their machines that is known as specifications. Such data are supplied to meet innumerable requirements and may be much or little, complete or vague, according to the inclination of those preparing them. Some builders are careful in the preparation of the facts they give to the market. Others are extremely careless and neglect what is essential or important. Those who have to depend upon literature for their information cannot be satisfied with what is insufficient, nor can they be influenced by what is denied to them by those who should be chiefly concerned in obtaining the fullest publicity. Whatever loss may experienced because of negligence is borne by the manufacturer primarily, and such loss is another's gain. There is much to be gained and nothing to be lost by the issuance of standard specifications. The manufacturers and the distributors of cars must thoroughly understand this. Why not give some thought and attention to so important a subject?

ENGINE RATING BY DIMENSIONS.

The accepted rating for engine power is established by the formula of the S. A. E., which regards merely the cylinder bore. Without question this is uniformity, but many manufacturers maintain a greater power is developed with their motors than is indicated by the rating. No one will take issue with this contention, but what is true of the one is probably true of the others, especially when stroke and engine speed are quite as important factors as the bore. Some makers claim the maximum power, others the normal. As a matter of fact the formula rating is more or less disregarded or rejected. Power delivered at stated speeds on dynamometers that are recognized as standard would be the accurate and reasonable manner of establishing rating. It would be the more satisfactory method, and it would certainly create a value that could not be discounted nor discredited. The merit of such a standard in a competitive market cannot be over-estimated.

THE DEALER'S REFERENCE LIBRARY.

The season of the year when the motor vehicle owner most desires to complete his equipment is the spring. While he may have knowledge of what he may require it is by no means certain that he is familiar with every article that may serve his purpose. He may be advised by those not better informed than himself. The one reliable source of information available is the man with whom he does business. If the dealer is alive to his own best interests he will have filed for convenience whatever data he may have received to which reference may be made, and with the facts so classified the business man may be able to secure continuous and profitable patronage.

This means that there is a value to all publicity received and that this is governed by the valuation placed upon it by the dealer. He alone can make its worth much or little. Everything depends upon his realization of the possibilities or utilizing the information, while in these days of specialized quick delivery it is the equal of a much larger stock and consequently greater investment.

EQUIPMENT OF THE GARAGE.

The equipment of the garage or public service station must be equal to the demands made by patronage. It should be chosen with a view of economizing time, labor and material, performing and finishing any ordinary or standard work, and giving results that will satisfy. It should not be purchased with any other purpose than serviceability and endurance, and there should be no utility that will not in productiveness and saving justify the investment, with reasonable expectation of business development. It is better to depend upon other shops for special work rather than to have unproductive facilities. It is constant economy that should be sought and a resourceful mechanic with good tools can do practically all work, with the possible exception of special machine methods. It is wise to discard what is not in every way serviceable because of the value of space. With some establishments special products may be turned out when the men have no regular work on hand and these may be marketed with good profit, but this becomes merely a manufacturing proposition. The main thing is to attract patronage and retain it.

CORRESPONDENCE ON MECHANICAL SUBJECTS.

Proper Method of Using Cotter Pins.

(45)—Will you please tell me if there is a right and wrong way of fitting together a pin connection held with a cotter pin and washer, particularly if the pin is set vertically? I have had an argument over this with a friend and would like to have you settle it.

D. W. HOBEN.

Springfield, Mass., Feb. 22.

If the pin be set horizontally, there is no choice, as the head of the pin may just as well be on either side. In this case, the way to assemble is the most accessible one; that is, place the head opposite the least accessible side, so the cotter pin will come on the other, or accessible one.

When, however, the pin is set in a vertical position, it is advisable to set the head on top, as then the loss of the cotter pin and washer would make no difference in the action of the joint. The pin will usually stay in place until given a very severe upward jolt, something that seldom happens; in fact, cases have been known in which an uncottered pin of this kind went for months of hard driving without trouble.

If, on the other hand, the head be put at the bottom and the cotter on top, the loss of the latter allows the pin to drop out, in which it is materially assisted by the downward action of the force of gravity acting on the pin. If a loose fit, as most of such pin connections are, the pin will not stay in place a mile after the cotter goes.

Rejuvenating Dry Cells.

(46)—Will you please tell me if there is any method of treating dry batteries to renew their lost strength; that is, bring up the amperage so they can be used again? I have always thrown mine away when they gave out, but have been advised lately that they can be rejuvenated by some process, so as to make them fit for use again.

D. W. ALDRIDGE.

Corning, N. Y., Feb. 22.

There are several methods, no one of which can really be said to be very successful. The old cells can be stood on a high, dry shelf of a dark closet for a couple of months, when they will recuperate to a large extent the lost amperage. This is not permanent, however, and will be lost afterward fairly rapidly, more so than a new cell.

Another method is to punch holes through the sealing wax on the top, and then pour water or a a weak acid in onto it. This will soak into the dry powder within, loosening it up when caked, and helping a whole lot. Muriatic acid is good for this purpose. Cases have been known in which this "stunt" brought the amperage from three up to 18. Like the other method, this is but temporary, as the cell after "fixing" loses strength more rapidly than a new battery.

If either of these methods be used, they should be worked in connection with the mutiple-series wiring spoken of in the last issue and elsewhere in this. This form of wiring seems to build up a low amperage cell to the equal of the other cells, so that a few rejuvenated batteries may be used with a large number of new, good ones. The results from this combination are said to be almost equivalent to those from a full set of new cells. When the new ones grow old and weak, they can be rejuvenated or put on the shelf while other new ones replace them. Then when the old ones give out, their places can be taken by the shelf or renewed cells.

Renewing Gears Without Recutting.

(47)—Will you please advise me if there is any way in which gear teeth can be formed on a broken gear, to allow of use only for reaching home? I refer to the case of a friend of mine, who, while out on a long tour and many miles from home, stripped four teeth off one gear in the transmission. He had access to a blacksmith shop, there being no repair shop within miles. Finally, he gave up and rode home by train, for an extra gear, then went back the next day, replaced the broken one, and drove home.

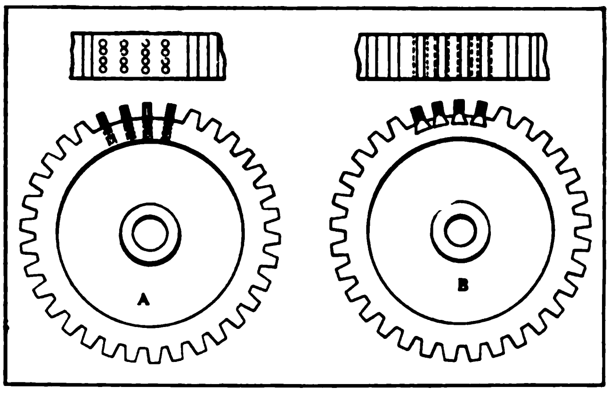
J. L. DUVEEN.

Hackensack, N. J., Feb. 21.

There are several ways in which your friend might have fixed up the broken gear well enough to get him home, after which he could secure a job as elaborate as he wished, even to a new gear. Two of these suggestions are shown in the accompanying sketch. In this, A depicts a gear with rows of pins screwed in place, these forming four lines across the face of the gear and being about the same diameter as the thickness of the teeth at the top.

If a tap and die are available, this is not a difficult job as compared with riding home and back by train, while the material and tools would be available in practically any blacksmith's shop. If not, the same scheme could be followed, driving the pins into place rather than threading them in.

The second sketch, B, shows how the same job is accomplished using a series of wedge shaped pieces to form the individual teeth. Undercut slots would be cut across the gear, where the teeth are broken off, and then the four pieces forged up to fit them. By driving in from the side and peining over the metal at the ends to prevent them from backing out in either direction they can be used for some time.



Two Methods of Temporarily Renewing Gear Teeth, When Several Have Been Broken Out.

To Color Brass Dark Blue.

(48)—In a recent issue of your publication I noticed a formula that would turn brass a dark blue. It was as follows: Copper carbonate 6.4 ounces, ammonium hydrate 3200 cc, water 1600 cc. Now I have been unable to find out what ammonium hydrate is after careful search and would thank you to inform me on the same. Any special directions you could give as to its application would also be appreciated as I want to use this on my lamps.

C. F. NUTTER, M. D.

Nashua, N. H., March 6.

Ammonium hydrate is nothing more nor less than the commercial ammonia or spirits of hartshorn as it was formerly called. It can be purchased almost anywhere for about 10 cents a pint. Clean the parts to be colored very thoroughly, making sure that no grease and oil adhere to them. This can be done with gasoline, or with kerosene and then gasoline. When clean, dip the brass in the solution and let it remain there for about 10 minutes, or if this be impossible, wash the parts over with it as frequently as possible for a space of say 15 minutes. When this has been done, wash in clear, running water.

Materials Used in Anti-Freezing Solutions.

(49)—Will you please tell me the composition or nature of the various substances used in the making of anti-freeze solutions? I do not care to have you give me a table of the temperatures of the mixtures, or anything of that sort, just a description of the chemicals used and their action on various substances.

FRED A. FRENCH.

New Britain, Conn., Feb. 16.

The following information relative to the most generally used chemicals, alcohol, glycerine, calcium chloride, will doubtless answer the purpose:

Alcohol is prepared by destructive distillation of various vegetable substances which contain starch or sugar, such as potatoes, beets and numerous grains and fruits. Any starchy material will serve for the production of alcohol and the real question is one of cost, which varies with the locality in which the manufacture is carried on. It mixes readily with water, and does not congeal at any known temperature, though its boiling point is about 175 degrees Fahrenheit, and above this point evaporation is rapid. It is a very volatile liquid and will evaporate at very moderate temperatures. The alcohol generally used is denatured by the addition of a substance which renders it unfit for drinking purposes and because of the recent removal of the government tax it may be obtained for about 60 cents a gallon.

Usual Number of Piston Rings.

(50)—What is the standard number of piston rings for an automobile engine? I have an old motor in which but three are fitted, while a friend with a similar sized modern machine has four. In arguing over this, I raised the point that the greater number of rings increases the amount of internal friction, and thus lowers the power. Am I right in that contention?

HOWARD C. DAVIS.

Stamford, Conn., March 5.

There is no standard, although motors usually have three up to four inches in diameter and four above that size. The contention as to power lost by the larger number is only partly correct; more rings with great stiffness would cause some loss, but this would be so small in amount as to be comparatively insignificant. This being the case, the number would have a very minor influence upon the power developed. This, on the other hand, would be more than offset by the increased compression resulting from the use of the greater number. It seems to be the modern tendency to fit many rings.

Home Made Distilling Apparatus.

(51)—I have an electric car with the old lead type of batteries, which use up a great amount of water in the electrolyte on account of the necessity for frequent refilling. The battery people advise me that they will not be responsible for the results, unless I use pure water for this purpose. Will you please advise me of some way in which I can purify ordinary water from the city faucet, so as to be able to utilize that?

DEWITT R. THOMASON.

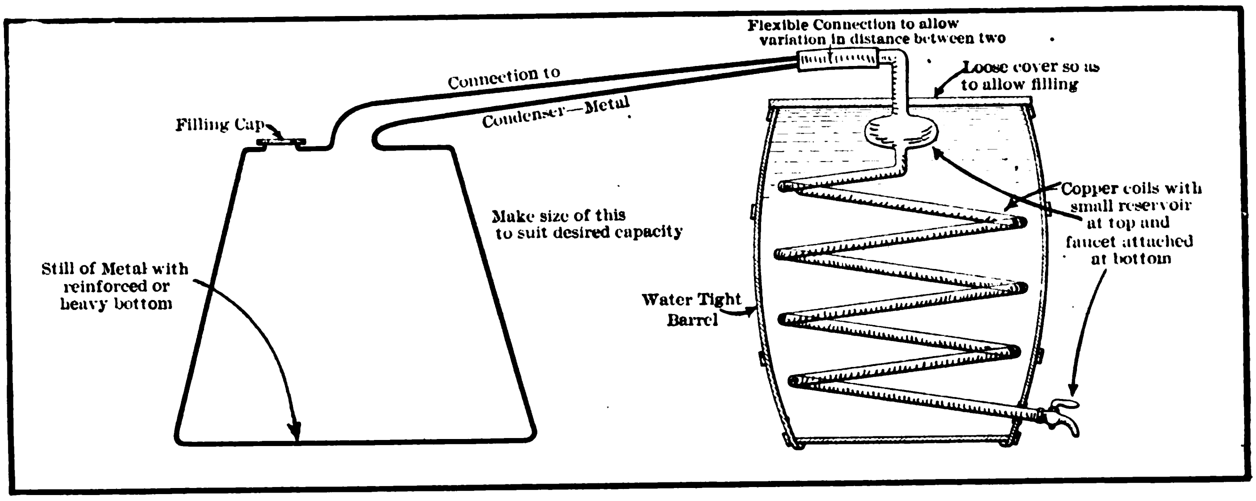
Chicago, Ill., March 1.

Pure water is obtained by boiling any available liquid, and condensing the vapor. This process eliminates all impurities from it, and if carried out in a careful manner, and repeated several times, almost chemically pure water may be obtained. For commercial purposes, however, this repetition would be unnecessary as the single distillation would purify it enough.

A simple apparatus which can be constructed by anyone in a short time is shown in the accompanying illustration. For this, obtain a stout barrel, and a coil of pipe, preferably copper, fitted into it in such a manner that the water surrounding the coil and filling the cask has no possible communication with the interior where the distilled product will come through. The only other need is a kettle or still in which to boil the water, this being of such capacity as to make frequent use of it unnecessary.

To utilize the outfit, fill the tank with water and start the fire. As soon thereafter as possible, fill the barrel with cold water, or arrange for running the same through it continuously. If the distilled, pure product must be kept on hand or retained for any time, it should be preserved in bottles with ground glass stoppers, as otherwise it will absorb impurities from the atmosphere, which will nullify the work of condensation. The best way is to make only what is needed at the immediate moment.

After a few trials, it will be found that the operation of the apparatus is simplicity itself, requiring only the filling of the still and kindling the fire.



Flexible Connection to allow variation in distance between two
Loose cover so as to allow filling
Connection to Condenser—Metal
Filling Cap
Make size of this to suit desired capacity
Still of Metal with reinforced or heavy bottom
Water Tight Barrel
Copper coils with small reservoir at top and faucet attached at bottom

Outline Sketch of Still and Condenser for Making a Supply of Pure Water, Depicting Pipe Connections; in Fact, Everything But the Fire.

Gasoline Engine Flywheels.

(52)—Will you please advise me how the limiting size of flywheels for automobile engines is determined, and what would be the objection to changing the size now on the motor to a larger and heavier one? It is an old car and the engine balance is so much out that I want to put on more weight, and in such a way as to get the best results. Can you give me any assistance in this matter?

GEORGE W. DOOLITTLE.

Boston, Mass., March 3.

The diameter of a flywheel in such a case is limited usually by the space into which it must be put, as the distance between the two parts of the subframe, while the rim width is kept down by the permissible length. The high speed of the engine brings about a big rate of travel at the rim, so that if the enlargement is too great, bursting may result.

The permissible tensile strength of cast iron, the usual material, is but 10,000 pounds a square inch, which with a factor of safety of 10, not too high for this material, gives a rim limiting velocity of 6085 feet a minute. This would keep the revolutions down to 1368 a minute, which being too low for ordinary engines causes a lowering of the factor of safety to give the turns desired.

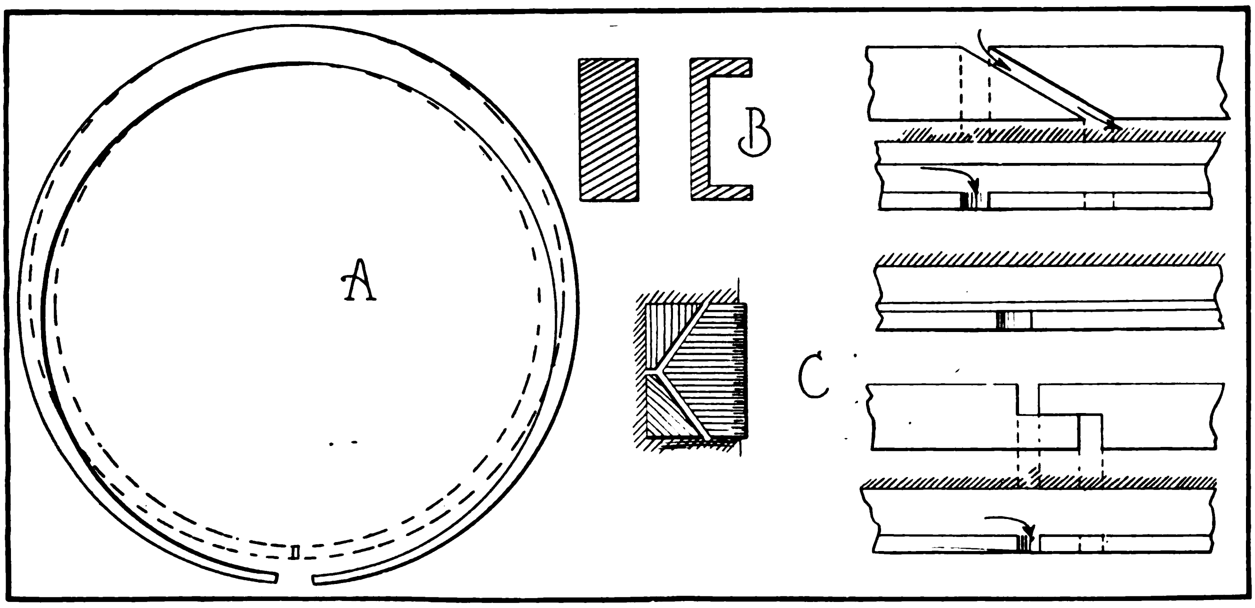
If a sub-frame or other parts limit the diameter, the width of face can be increased, or should that be kept down in any manner, the rim thickness can be made greater Either one of the latter is satisfactory, and the weight should be put on in several trials, if this can be done without objectionable expense, adding not over 25-30 pounds at a time.

Information On Piston Rings.

(53)—We are very anxious to have some good, reliable information on the subject of piston rings, so write to ask what is the best ring to your knowledge? How much pressure in pounds should each good ring exert on the cylinder wall, and what is the best method and instrument for determining this? Is a strong, stiff ring most beneficial for holding compression in the cylinder head and can the same be too strong, so as to score the wall? How weak can a ring be and still hold the pressure? Are additional precautions taken in the construction of these parts for racing cars?

C. W. & C. FOUNDRY CO.
Muskegon, Mich., March 2.

There is no such thing as a perfect piston ring, therefore there can be no best, at least none upon which an agreement would be found. The form most used is the eccentric, in which the width tapers from a very narrow edge at the cut to the extreme size at the back opposite this point. This results in a ring of uniform spring, those ends which are forced to contract and expand being the smallest in section and thus most easily compressed or allowed to extend. In the accompanying sketch, A shows this, the solid line depicting the open ring out of the cylinder and ready for use, while the dotted portion indicates the same when compressed into position within the cylinder. This brings out clearly the method in which the spring is obtained, as well as the tapering section.



Sketch of Piston Rings, Showing at Left, Usual Form, Open and Compressed; in Middle, Various Shapes of Joints, and at Right, Some Sections.

In machining, both outside and inside are turned to exact circles, the full circle depicting the normal condition, the opening being cut out after finishing. This form has the section shown at the left of B, that at the right being a new English shape, for which great things are claimed. It is said of this that the spring is greater with equal strength, while the weight is but slightly more than half. The latter multiplied by 16 (four rings in each of four cylinders) should have a large and favorable effect upon the running balance of the motor.

At C, on the right, are seen a number of methods of cutting the ring. Practise in this respect varies, although it is thought that there are more diagonals, like that at the top, than any other. In this form, the gas may leak through the cut, as indicated, there being an opening clear across the ring at the thin edge. This has been avoided by placing a pair in a groove with the thick edge of the outer one opposite the cut of the inner. Thus, while there is a small space inside the latter, there is none between the two, and no gas can leak through. A top view of this construction is shown in the middle figure.

At the bottom is seen a step or lap joint as it is variously called. This has the cut made in two sections, so that an extension of half-width is formed on each end, these being of equal length. When the ring is sprung into place, these almost meet, but a small half-width hole is left at the top on one side and the bottom on the other. The space behind the ring connects the two, so there is possibility for leak here also. This, too, is sometimes avoided by the use of two in a groove, one the inversion of the other.

The section in the middle of the drawing shows a ring made in three parts. The object of this was to make a more uniform, more springy type which absolutely would not leak. A pair of small members of triangular section occupy the inner, upper and lower corners, and present faces tapering towards one another. The outer or wearing part has a flat exterior, but a tapering interior to fit against these. The inner ones exert pressure on the outer and that in turn, upon the cylinder walls. It is good, but expensive.

Racing engines and aeronautical motors are usually altered to save weight, the rings being lessened in numbers and stiffened to make up for this. Sometimes, a compound fitting takes the place of all others, as on the Gnome rotating engines of seven and 14 cylinders, where a single compound ring answers for each piston.

Other things being equal, it is generally considered that as weak a ring as will hold the pressure is better, for this consumes less of the engine power in frictional losses.

Why a Mixture Backfires.

(54)—Will you please advise me why it is that a weak mixture will backfire when a rich one will not, that is, what is the theory of action in this case?

J. R. COYLE.
Fall River, Mass., March 2.

A weak mixture is one which contains too much air relative to the amount of gasoline vapor present. Such a mixture fires more slowly than does either a rich one or a vapor which is exactly correct. The latter will explode most quickly, the overrich combination next and the lean mixture slowest.

When a spark is produced in a mixture which is too weak, there is a tendency to do one or two things;

either not explode at all but burn instead, this being continued through the engine, exhaust manifold and sometimes muffler, or the igniting spark will run through the mixture in the opposite direction; that is, pop back in the carburetor.

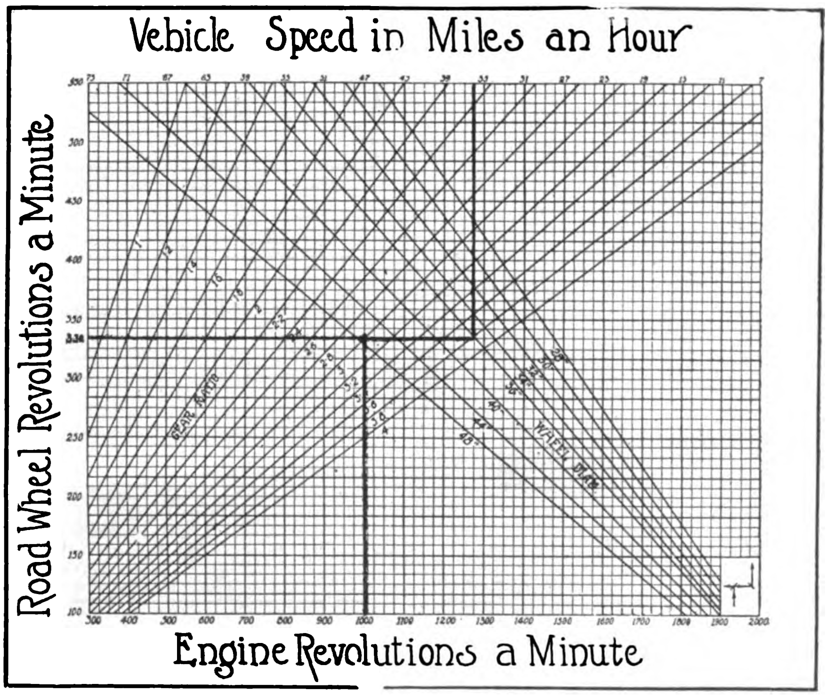
The former action causes what is called a muffler explosion, the slow burning gases carrying on their action until in the muffler they meet with additional gas, which takes fire rapidly and causes an exploding noise. This latter action may also be produced by running with a rich mixture but no spark, thus filling the muffler with combustible gas. Then a stroke or two which is properly sparked will carry flame to this unburned gas, causing an explosion there.

Handy Speed Chart.

(55)—Will you kindly give me a list, a chart or table which will show at a glance the speed of the car, when the engine turns and gear ratio are known? I find that such would be very useful to me, as well as a number of friends, since at present we are obliged to figure out each case separately. A proper form of table or chart would allow of taking these off by inspection.

W. H. SONNSCHEIN.

Boston, Mass., March 5.



Speed Chart from Which Either Road Wheel Revolutions or Miles an Hour May Be Obtained, Knowing Engine Revolutions, Wheel Diameter and Gear Ratio.

A chart is appended herewith which gives all that is asked by the subscriber above, and in addition several useful items. To figure the vehicle speed, it is necessary to know the engine revolutions, the gear ratio and the wheel size, not the two former alone, as mentioned above. Having these it also is possible to determine the road wheel speeds.

To explain the chart: The engine revolutions are laid off on the horizontal base, from the right hand corner of which a series of diagonals represent the wheel diameters. From the left hand lower corner another set of diagonals indicate the gear ratios. At the left side, the vertical units represent wheel revolutions, while at the top will be found the vehicle speeds. To use: Start with the engine speed, follow the line indicating this vertically upwards until it intersects the gear ratio inclined line. By following that to the left margin, the wheel revolutions will be given, while following it to the right will intersect the wheel diameter. Thence, a vertical to the top will result in the desired quantity.

An example is worked out in heavy lines. This is for the following data: Engine revolutions, 1000 a minute; three-to-one gear ratio, 46-inch wheels. Followed through, as indicated, this gives 36 miles an hour, and incidentally, 330 turns of the wheels.

Oil and Kerosene Mixtures.

(56)—Will you please advise me whether it is necessary to drain off the oil from the crankcase when cleaning out the carbon with kerosene?

A. M. De GRUCHY.

Newark, N. J., March 3.

It is advisable but not necessary to drain off the oil, when cleaning the carbon out in this manner. If the crankcase is not drained, the kerosene will mix with the lubricant, diluting the same. While oil is a good lubricant, kerosene is poor in this respect and should be used only in cases of absolute necessity.

The case should be drained clean, and the drain cock left open so the kerosene can drain through. This will serve the double purpose of cleaning the case as well as the cylinders. The carbon removal process having been completed to the owner's satisfaction, clean, fresh oil may be put back in the case.

Installing a Steam Power Plant.

(57)—I have a job of placing a steam power plant in a gasoline chassis, and would like to have some help as to the location of the various parts. The burner is similar to the Borg and has the porcupine type of boiler. How should this be placed; that is, how much space left between burner and boiler, and how should it be jacketed? It is a second hand outfit and no directions are furnished.

J. E. WHITMORE.

Scranton, Penn., Feb. 29.

Of necessity the placing of all the parts will depend upon the amount of available area left by the gasoline engine. In this will enter the width between the two sides of main or sub-frame, the height of the bonnet at the centre and sides, also the length from front end to dash. It is barely possible that this will be so limited that some of the parts will have to be located beneath the floorboards.

The burner should be slightly more than three inches below the lowest tubes of the boiler, this forming the combustion space. It would be regulated best from the burner and boiler used, the distance varying to give the quickest steaming and best all around results. The boiler should be covered with sheet iron and that in turn, jacketed with about an inch of asbestos pipe covering plaster. This material comes in the form of a coarse, stringy powder, which combines with water to form a cement like plaster. When mixed, this is applied with the bare hands, shaping the same as it is put on. With care a neat, smooth surface may be produced.

For more specific information, it would be desirable to apply to some concern which is still making this type of car. The following are recommended: The White Company, Cleveland, O.; the Stanley Motor Carriage Company, Newton, Mass., and the Lane Motor Vehicle Company, Poughkeepsie, N. Y.

Preserving Drawings—To preserve sketches in pencil or working drawings in India ink, an authority advises a coating of photographer's collodion after two per cent. of stearine has been added to it. The drawing is laid on a sheet of glass, marble, or other smooth surface and the mixture poured over it and spread over its surface with a soft brush. The liquid dries rapidly, and after 15 or 20 minutes the drawing is perfectly dry and white.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS

The following companies have been incorporated recently to manufacture or deal in motor cars, accessories, etc.:

General Automobile Company, Boston; capital, $15,000; incorporators, Leonard M. Cotton, Herman P. Bell, Lemuel W. Peters.

Rowan Automobile Company, Dover, Del; capital, $5100; incorporators, Ludwig Isenberg, David Isenberg, Oscar Isenberg, all of Philadelphia.

The Burgner-Cade Auto Company, Veedersburg, Ind.; capital, $6000; incorporators, D. S. Cade, J. W. Burgner, O. E. Cade.

Buffalo Auto Novelty Company, Buffalo, N. Y.; capital, $5000; incorporators, George A. Orr, Donald S. Carroll, Henry L. Jauch.

Taylor Motor Company, Lynchburg, Va.; capital, $25,000; president, T. A. Jennings; vice president, R. C. Taylor; secretary, H. P. Taylor.

Cobb Motor Company, White Plains, N. Y.; capital, $5000; incorporators, Frederick W. Cobb, J. Oakley Hobby, Jr., Arthur L. Strang, Frank J. Lamb.

Mohawk Garage Company, Brooklyn, N. Y.; capital, $50,000; incorporators, B. J. Roesler, Jr., A. M. Roesler, W. Roesler.

Lichty Sales Company, 602 Blackhawk building, Waterloo, Ia.; capital not given; H. F. and O. Lichty, owners and managers.

Edwards Auto Company, Watertown, N. Y.; capital, $7000; incorporators, Frank H. Edwards, Rose E. Edwards, Ross C. Brimmer.

Universal Motor Car Company, Pittsburg, Penn.; capital, $10,000; incorporators, Jacob W. Kennedy, Harry A. Cornelius, William M. Carleton, Harry E. Weiskopf.

Allen B. Laing Company, Plainfield, N. J.; capital, $20,000; incorporators, Allen B. Laing, Isabel M. Laing, George F. Graves, Augustus V. Searing, Eugene M. Laing.

F. B. Williams Company, Cincinnati, O.; capital, $10,000; incorporators, Fanny B. Williams, George C. Kuhn, Dwight F. Jerauld, Samuel Hummel, David S. Buchanan, Jr.

Jay A. Rickard Company, Schenectady, N. Y.; capital, $72,000; incorporators, J. A. Rickard, Jesse A. Rickard, B. C. Wheaton.

The Herring Motor Car Company, Des Moines, which delivered 1146 Ford cars last year, is said to be one of the largest distributing houses in the country. The company announces that to date it is 267 ahead of the 1911 record.

The Abbott Motor Charlotte Company, Raleigh, N. C., announces a change in its name to that of the American Motor Car Company of which Julian L. Lummus is president and W. Ruffin Smith, secretary.

The Shawnee Motor Car Company, Topeka, Kan., which was incorporated recently, has taken over the business of the Shawnee Motor Company, a partnership consisting of Frank Holland and B. F. Taylor. The new company has leased a building at 928 Kansas avenue and will make extensive alterations.

Harvey Parker, Worcester, Mass., special agent for Batavia tires, announces that he has taken the agency for the Palmer-Singer line, made by the Palmer & Singer Manufacturing Company, Long Island City, N. Y.

S. G. Meredith, Richmond, Va., is building a garage on Monument avenue, between Sheppard and West streets.

The Broadway Motor Car Company has been formed at Columbus, O., to handle the Paige-Detroit in Franklin county and to do a general garage business. J. F. Morgan and H. F. Kaiser comprise the new concern.

Sperry & Hoover has taken over the repair business of the Adamson Automobile Company, at 35 West Mound street, Columbus, O. Mr. Adamson will continue to devote his attention to selling motor cars.

The Haus & Bitler Company, Wapakoneta, O., has taken the agency for Stoddard-Dayton cars.

The Albany Garage, Albany, N. Y., one of the largest and oldest in that state, will erect shortly a three-story building on Howard street to handle commercial vehicles. The concern has taken the agency for the White line, made by the White Company, Cleveland. Chauncey D. Hakes, who has had considerable experience in the automobile industry, is manager.

WITH THE MANUFACTURER

The Connecticut Shock Absorber Company, Meriden, Conn., announces the opening of an office, show and stock room at 231 West 54th street, New York City, where a complete line of Connecticut shock absorbers and fittings will be carried as well as installed.

The Velie Boston Branch of the Velie Motor Vehicle Company, Moline, Ill., announces the following appointments of agencies to handle Velie pleasure and commercial vehicles: J. T. Curtis & Co., Hartford, Conn.; C. H. Sawyer Company, Manchester, N. H.; Robert Kayser, Concord, N. H.; Walter Velie Johnson, Burlington, Vt.

"The Great Western Tattler," a publication devoted to the interests of the Great Western Automobile Company, Peru, Ind., contains several interesting as well as instructive articles pertinent to the motor car.

The Central Transfer & Storage Company, Indianapolis, Ind., maintains a fleet of automobiles and in the accompanying illustration is depicted four Mais trucks, made by the Mais Motor Truck Company, and six Premier delivery vehicles, manufactured by the Premier Motor Manufacturing Company of the same city. These machines are utilized by the newspapers of Indianapolis and one publication, the News, has 36 sub-stations which are supplied by 10 machines, these doing the work in about one-third the time formerly required by 18 horse drawn vehicles.

The Abbott Motor Company, Detroit, announces a sales agency at South Edmonton, Alberta. O. J. Edinger, an experienced automobilist, is the proprietor, and the agency will be known as the S'Cona garage.

Edward Wells of Boston has been re-engaged by the E. R. Thomas Motor Car Company of Buffalo, N. Y., as assistant sales manager of the factory.

A. C. Stebbins, secretary and general manager of the Lansing Company, Lansing, Mich., is making a trip through Guatemala and Panama.

The Stewart & Clark Manufacturing Company, Chicago, has moved its Minneapolis, Minn., branch from 45 South 10th street to 1202 Hennepin avenue, where larger and more convenient quarters will be had for the handling of the Stewart speedometer as well as its installation. The new office will be in charge of T. J. Snelling, who has been with the company for some time. A. H. Champlin, who has had charge of the office, will call upon the trade in Minnesota, outside of Minneapolis and St. Paul, and Iowa.

Charles F. Kellom & Co. the New England branch of which is located at 284 Columbus avenue, Boston, announces that the Darling Automobile Company of Portland and Auburn, Me., has secured the exclusive right for the sale of Invader oil in the entire State of Maine.

The Remy Electric Company, Anderson, Ind., maker of ignition specialties, has appointed the following concerns to act as Remy service stations in their respective cities: Child, Day & Churchill, Inc., Spokane, Wash.; Washington Auto Supply Company, Seattle, Wash.; Archer & Wiggins Company, Portland, Ore.; Ballou & Wright, 86 Sixth street, Portland, Ore.; Browne & Leacy, Savannah, Ga.; Joseph Woodwell Company, 201 Wood street, Pittsburg, Penn.

J. K. McKeough has accepted a position with the Chicago branch of the Velie Motor Vehicle Company, Moline, Ill. He will be connected with the commercial car department.

Edgar E. Muller has been appointed manager of the recently established service department of the Ohio Motor Car Company, Cincinnati, O.

The Abbott Motor Company, Detroit, announces that arrangements have been made whereby the White Automobile Company of Baltimore, Md., will have the exclusive sale of Abbott-Detroit cars for the States of Maryland and Virginia. Another contract is that with the Eastern Motor Company of Atlantic City, N. J.

The Stewart & Clark Manufacturing Company, Chicago, has leased the store and basement at 174 Columbus avenue, Boston.

Manager Westerdale of the Chicago branch of the R-C-H Corporation, Detroit, has appointed W. J. Williams manager of the local retail sales.

The Greenville Metal Products Company, Greenville, Penn., will engage in the manufacture of motor cars, having closed a contract, it is stated, for the delivery of 13,500 cars to a western concern. The officers of the Greenville concern consist of: President, S. H. Penfield; vice president, Fletcher Goodwill; secretary and treasurer, F. L. Fay.

The Omaha Motor Company, Omaha, Neb., which was incorporated recently, is to erect a factory on the site adjoining that of the Stroud Machine Works. The company is to build a five-passenger car of moderate price.

Hamilton Cowley, Elwood E. DeHart, Edward G. Richardson and Walcott V. Smith are recent additions to the sales force of the New York branch of the R-C-H Corporation of Detroit.

The Fishback Motor Company of Newark, N. J., is negotiating with the Bristol Business Men's Association of Bristol, R. I., relative to removing its plant to that town.

Lucius Wilson has resigned as secretary of the Chamber of Commerce, Detroit, to become associated with the Warren Motor Car Company of that city, maker of Warren cars, in the capacity of vice president and general manager.

The De Tamble Motors Company, Anderson, Ind., has been reorganized, and James W. Sansberry, president of the National Exchange Bank, has been appointed general manager. Charles H. Walters, who has been secretary and general manager, is to become general superintendent. The capital stock has been increased to $200,000.

The King Motor Car Company, Detroit, maker of the King car, is occupying its new plant formerly utilized by the Hupp Motor Car Company. The factory will provide a floor space of about 70,000 square feet, and comprises practically a group of four buildings.

The Steenrod Dual Ignition Spark Company has been organized and will locate in Wheeling, W. Va. The company will manufacture a dual ignition device which distributes two sparks to one cylinder at the same time by the use of a single distributor. The ignition system is the invention of George W. Steenrod. It is applicable to both new and old motors.

The Bridgeport Brass Company, Bridgeport, Conn., is issuing a neat postal folder calling attention to the Atlas pump and other products made by it.

The Remy Electric Company, Anderson, Ind., announces the establishment of a new service station with the Lamb Electric Company of Grand Rapids, Mich.

The Stewart & Clark Manufacturing Company, Chicago, well known maker of speedometers, completed recently a new building at a cost of $100,000 in which modern machinery has been installed to take care of the drop forging end of the business.

The Henderson Motor Sales Company, Indianapolis, Ind., distributor of the product of the Cole Motor Car Company of that city, announces the appointment of new agencies as follows: George Mills, Shreveport, La.; H. F. Russell, Ocean Springs, Mass.; Byron & Cunningham, 109 East Elm street, Waseco, Minn.; Warley & Terry, Viola, Ill.

George E. Daniels, general manager of the Oakland Motor Car Company, Pontiac, Mich., has appointed Thomas W. Wilson as works manager. Mr. Wilson has had an experience in the automobile industry extending over 15 years and was formerly general superintendent of the Fiat plant at Poughkeepsie, N. Y.

The Ohio Motor Car Company, Cincinnati, O., announces the opening of an agency at Toronto, Can., with Hess & Meyers. The latter has a sub-agency at Massey, Ont. A new garage and salesroom, 50 by 150 feet, will be erected at Toronto and will be located on Richmond street, the centre of the automobile district.

The Colt-Stratton Company, New York City, eastern distributor of the Cole Motor Car Company, Indianapolis, Ind., gave a banquet in the former city recently at which the eastern agents of the company were the guests. It was the second annual smoke talk and William L. Colt presided as host. Agents were present from Maine to Maryland, also G. E. Roberts of Aukland, New Zealand. The feature of the banquet was the presentation of a gold medal to Henry J. Habich of the Boston agency by President J. J. Cole of the company in recognition of the excellent work of the former with a stock car in racing events during the past season. President Cole spoke of the new factory being erected, and Treasurer Frank Morrison dwelt upon the racing situation. Charles P. and R. P. Henderson of the Henderson Motor Sales Company, Chief Engineer Charles Crawford, A. F. Knoblock and William L. Colt spoke upon subjects pertinent to the automobile industry.

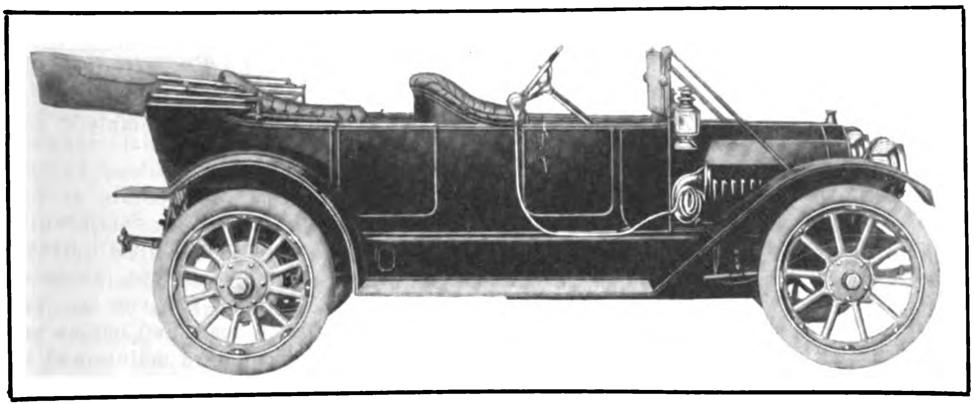
The OttoMobile Company, Philadelphia, which was organized recently to take over the manufacture of pleasure and commercial vehicles, formerly made by the Otto Gas Engine Works, Philadelphia, announces that a new factory will be built at Mt. Holly, N. J. The Delamater-Byrnes Automobile Company has been awarded the New York territory and quarters have been established at 10 West 60th street. L. F. Hewlett has taken the Brooklyn agency and is located at 1270 Bedford avenue.

The Shortsville Wheel Company, Shortsville, N. Y., maker of automobile wheels, is erecting an addition to its plant. The new structure will be of brick, 150 by 40 feet.

The Henderson Bulletin, issued by the Henderson Motor Sales Company, Indianapolis, Ind., contains in the current number a technical description of the Cole motor cars for which the company is distributor.

The Willys-Overland Company, Toledo, O., recently made a shipment of 99 Overland automobiles to New York City, whence they were consigned to foreign ports. A special train was made up consisting of 31 flat cars, each laden with three machines. In the accompanying illustration is depicted the train pulling into New York City, where the boxed vehicles were transferred to steamers.

ATTRACTIVE LINES FOR LIVE AGENTS.



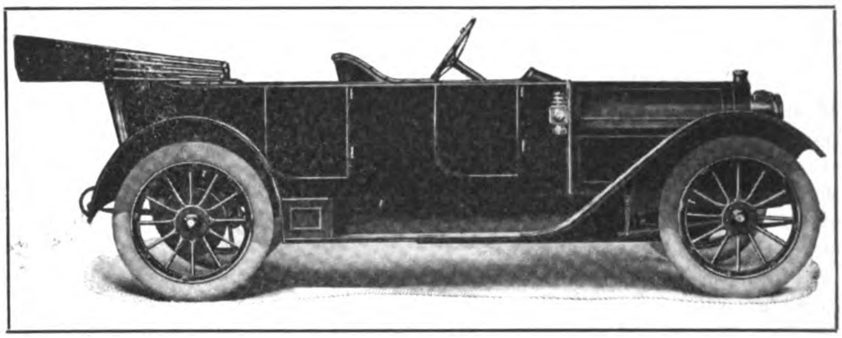
Marquette Model 25, Manufactured by The Marquette Company, Detroit Mich.—Price $3000.

Marquette.

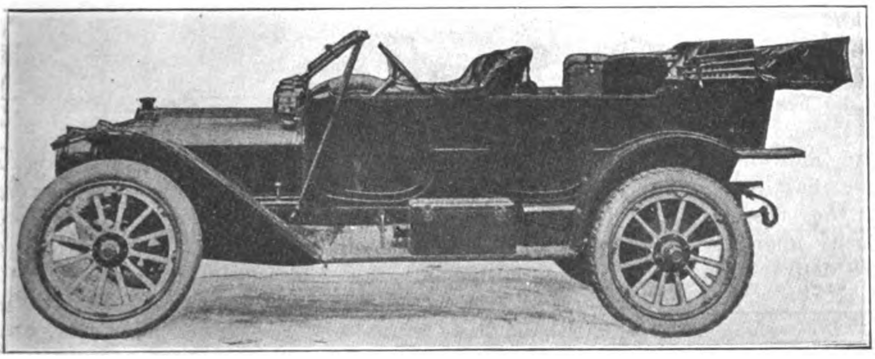
Motor—Four cylinders.
Bore—Five inches.
Stroke—Five inches
Horsepower—Forty.
Ignition—Dual.
Speeds — Three forward, reverse.
Clutch—Cone.
Drive—Shaft.
Springs—Semi-elliptic.
Tires—36x4.5.
Wheelbase—122 inches.
Body — Five-passenger touring.

Michigan.

Motor—Four cylinders.
Bore—4.25 inches.
Stroke—5.25 inches.
Horsepower—Forty.
Ignition—Dual.
Speeds—Three forward, reverse.
Clutch—Multiple disc.
Drive—Shaft.
Springs—Half and three-quarter elliptic.
Tires—34x4.
Wheelbase—116 inches.
Body—Five-passenger touring.



Michigan "40," Manufactured by the Michigan Buggy Company, Kalamazoo, Mich.—Price $1500.



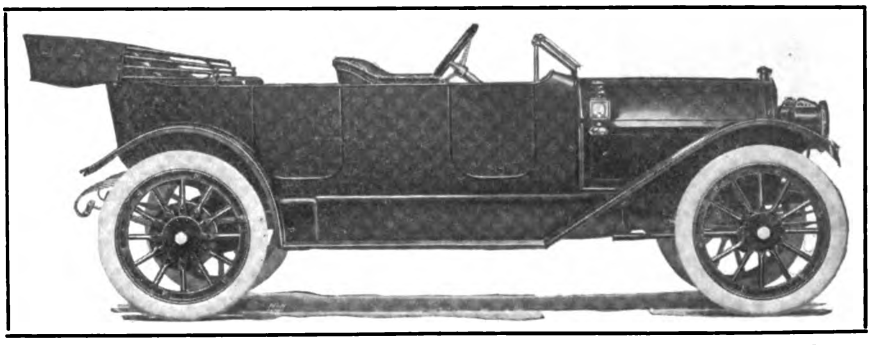
Berkshire, Four-Cylinder, 35-40 Horsepower, Manufactured by the Berkshire Motor Company, Cambridge, Mass.—Price $3000.

Berkshire.

Motor—Four cylinders.
Bore—4.69 inches.
Stroke—5.50 inches.
Horsepower—Thirty-nine.
Ignition—Dual.
Speeds—Three forward, reverse.
Clutch—Multiple disc.
Drive—Shaft.
Springs—Half and three-quarter elliptic.
Tires—36x4 front, 36x4.5 rear.
Wheelbase—124 inches.
Body—Five-passenger touring.

Imperial.

Motor—Four cylinders.
Bore—4.5 inches.
Stroke—5.25 inches.
Horsepower—32.4.
Ignition—Dual.
Speeds—Three forward, reverse.
Clutch—Cone.
Drive—Shaft.
Springs—Half and three-quarter elliptic.
Tires—36x4.
Wheelbase—120 inches.
Body—Five-passenger touring.



Imperial Model 44, Manufactured by the Imperial Automobile Company, Jackson, Mich—Price $1750.

STANDARD LINES OF RECOGNIZED LUBRICANTS.

Of prime importance in the proper functioning of the motor and other mechanical parts of the automobile is the matter of lubrication. Most manufacturers of oils and greases produce special preparations for the work they are intended to perform. This is a situation that had been developed with the motor car industry, until it is possible now to secure a grade of oil or grease designed especially for practically every make of car.

Lubricants: Havoline and Colonial.

Motorists cannot afford to experiment with lubricants of unknown or doubtful quality. The manufacturer of any product adopts a trade mark, or distinguishing feature, for the protection of the public. By continually making this feature prominent the user soon becomes familiar with the product and is intuitively warned against accepting substitutes under the plea that they are just as good.

Manufacturers of motor oils and greases have adopted distinguishing names and special cans whereby it is an easy matter for the motorist to recognize the article which he has found to be best suited to his needs. These names and cans, therefore, become the proper protection of the public, and their continued use insures to the purchaser that he will be able to rely upon the product which they represent.

Too much stress cannot be placed upon the admonition to see that the goods are delivered in the original package. Many makes are extensively exploited, and these have come to be recognized as standard productions. Herewith are presented a number of the better known oils and greases, the illustration of the cans being with the idea of causing them to be even more familiar. A brief description of the various products will suffice to indicate their particular features. The list is by no means complete, but includes those most extensively exploited.

Lubricants: Panhard and Pan-American.

Colonial.

The Colonial brand, made by Borne, Scrymser & Co., New York, Philadelphia, Boston and Fall River, includes Colonial motor oil, Colo grease, Colonial timing gear oil and Silex grease. The concern has been producing lubricants for 30 years and has an enviable reputation for the high standard maintained by its products. Colonial oil is made in varying consistencies for the differing designs of motors, while Colo grease is particularly adapted for use in the transmission gears, being made especially for gear lubrication. Colonial timing gear oil also has a special purpose as indicated by its name. Silex grease is a product designed to lubricate and last, and at the same time to reduce noise in an appreciable degree.

Dixon's Graphite.

The line of graphite products made by the Joseph Dixon Crucible Company, Jersey City, N. J., is most complete. Inasmuch as the object of lubrication is that of providing a film sufficiently viscous to prevent the metal surfaces from coming in contact, it is held that flake graphite will attach itself directly to the metal, filling all the microscopic depressions and forming a smooth, tough, durable coating. For transmissions, flake graphite grease is recommended, and in this a proper amount of finely ground fibre is thoroughly mixed. Graphite cup greases are made in six degrees of hardness, varying from the consistency of vaseline to that of tallow.

GREDAG

Lubricants: Dixon's Graphite and Gredag.

Eagleine No-Karbon.

Eagleine No-Karbon oil is made by the Eagle Oil & Supply Company, Boston, Mass. It is held to possess the proper viscosity and to be pliable under all conditions of heat and cold, working well in the heat of the cylinder and feeding perfectly from an oil receptacle exposed to severe cold. Special attention has been paid to the matter of carbonization, and the addition of No-Karbon in the name of the product appears to be warranted by the success which has attended its use under most severe conditions. The line includes oils and greases for varying purposes, and Solarine polishes.

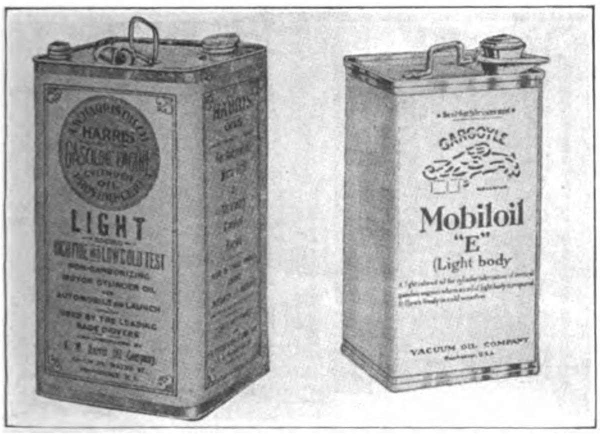
Harris.

Harris oils, the product of the A. W. Harris Oil

Company, Providence, R. I., are made in various degrees of consistency, each for the special purpose for which it is intended. The highest grade of Pennsylvania crude is utilized as a basis and the process of filtration is carefully watched and inspected. The ingredients which tend to form soot deposits are eliminated by a special process, and the result is such that the maker claims it is impossible to secure a higher degree of quality in this respect. Harris trans-compound is prepared for use with transmission gears and the same extreme care is taken in its production. A heavier bodied lubricant is provided in the gear and transmission oil made by this concern, which also specializes in a superheated steam cylinder oil for steam vehicles.

Havoline.

The Havoline Oil Company, New York City, absolutely controls its own oil fields, thus being supplied with a uniform quality of crude, which forms the basis for the well known Havoline oils. In its four refineries it maintains laboratories in charge of expert chemists who are constantly at work maintaining the standard set by this product. After the laboratory investigation and tests, which include a thoroughly scientific system of filtration for the removal of carbon producing elements, the oils are tested in engines on the block and on the road. Among the recent additions to the line is a special oil of heavier body and higher viscosity for motor truck use.



Lubricants: Harris and Vacuum Mobiloil.

Invader.

Chas. F. Kellom & Co., Philadelphia, has been producing Invader oils and greases for automobile work since the very inception of the industry, and of course, was interested in the manufacture of lubricants for many years previous to that time. About a year ago, it brought out the Invader gear oil, a special preparation for use in timing gears. This is a semi-fluid compound designed especially for the work it is to perform, and so successful has it been from the first that it has been adopted by numerous manufacturers for exclusive use in their machines. About the same time, a special motor truck oil was brought out as well.

Kincaid.

William T. Kincaid of the Kincaid Oil Company, Providence, R. I., is well known as a racing driver, although his attention has been turned toward the production and sale of lubricants in more recent years. His connection with the racing end of the industry placed him in close touch with the needs of automobile engines with respect to lubrication and this knowledge has been of material aid in the production of Kincaid oils. It does not follow, that Kincaid oils are designed especially for racing machines. The same qualities are needed for every day driving as in winning contests. These qualities, Mr. Kincaid has studied with the mind of an expert, and Kincaid oils are the result of this scientific and practical experience.

LUBROLEINE
LIGHT
MOTOR OIL
FISKE BROTHERS REFINING CO.
NEW YORK
POLARINE
Polarine
FOR MOTOR CAR AND MOTOR BOAT LUBRICATION
ZERO
STANDARD OIL COMPANY

Lubricants: Lubroleine and Polarine.

Lubroleine.

Lubroleine oils are made by the Fiske Bros. Refining Company, New York City, in three grades—heavy, medium and light. They are refined and made from the highest grade Pennsylvania crude, and are designed to meet the most exacting requirements of automobile, motorcycle, aeroplane and motor boat lubrication. The line also includes Lubroleine gearcase compound, a highly viscous grease of proper proportions; Phoenixo gearcase lubricant, in fluid, semi-fluid and heavy densities; and Slimax-Synovia, a solidified oil or cup grease. Special features claimed for all these products include their purity and uniformity, as well as their adaptability under any working and atmospheric condition.

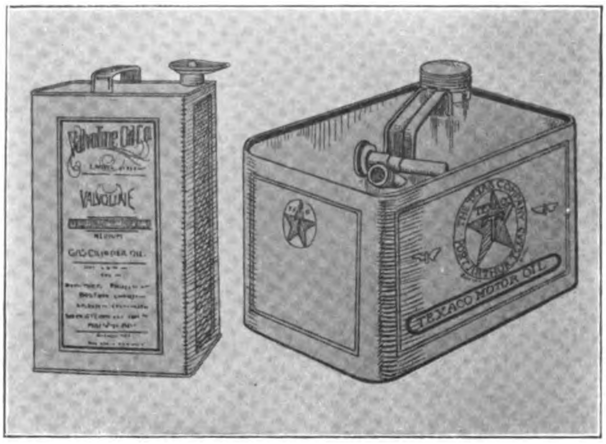
Mobiloil.

The Vacuum Oil Company, Rochester, N. Y., produces the Mobiloil line. Of the Mobiloils it may be stated that grade E is a light colored oil for cylinder lubrication. A is of medium body and is intended to hold its body under extreme heat. It may be used in electric vehicle lubrication as well as in gasoline engines. C is a heavy dark oil for transmissions and differential gears, especially for ball or roller bearing types. D is a heavy oil for steam cars. Arctic is a light colored oil which flows freely in the coldest

THE OIL YOU WILL EVENTUALLY USE
Kincaid Oil
INVADER GEAR OIL
FOR PACKARD TIMING GEARS
INVADER GEAR OIL

Lubricants: Kincaid and Invader.

weather. Vacuum transmission greases, made by the same concern, are in three densities. Vacuum Mobilubricant is a newer product, especially adapted for use in compression cups and for packing steering gears. All are of the best quality and have enjoyed a world-wide reputation for efficiency under all conditions of service.



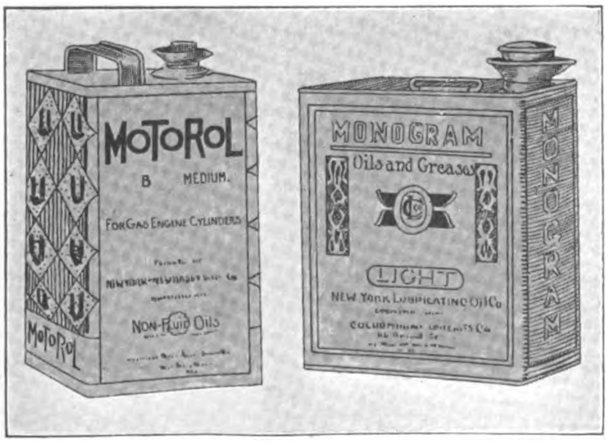
Lubricants: Valvoline and Texaco.

Monogram.

The New York Lubricating Company, now consolidated with the Columbia Lubricants Company of New York, has changed the style of its cans materially, the principal object being to insure that the purchaser shall receive Monogram oil just as it leaves the refinery. The cans are filled at the plant, and the sealed pouring spout is attached afterward. Monogram oil, therefore, comes to the user thoroughly sealed, and he must break the seal before it is possible to utilize the contents of the can. The maker has studied carefully the requirements of various cars and the lubricants are made in four grades, light, medium, heavy and V, for different makes of machines. Special attention is paid to the matter of eliminating all carbon producing impurities, and the success which has attended the use of Monogram oils in contest and road work is well known.

Motorol.

Motorol is made by the New York & New Jersey Lubricant Company, New York City, in varying densities to meet the requirements of a large number of cars. This is a cylinder oil designed to possess the most lubricating body with the least carbon. The same concern manufactures Non-Fluid oil for bearings, transmissions and differentials, this being a pure mineral oil lubricant which is claimed to possess decided advantages over greases and compounds. This latter oil is marketed in a patented can, styled Kejex, with a long grease gun spout and a key in the bottom to force the lubricant through this into the various grease cups, etc.



Lubricants: Motorol and Monogram.

Oildag.

The International Acheson Graphite Company, Niagara Falls, N. Y., is producing a line of graphite products in which the term Dag is used. The word "Dag" is made up of the initial letters of "Deflocculated Acheson Graphite." Therefore, Oildag is deflocculated Acheson graphite in oil, while Gredag is the same substance in grease. Mineral oil is utilized in Oildag, and it is claimed that this mixture will not deteriorate under any change in conditions of use. Gredag is made in four grades, semi-fluid, soft, medium and hard.

Pan-American.

Miller's Pan-American oils are made by Chas. E. Miller, 97-103 Reade street, New York City. They are refined from the highest grade Pennsylvania crude; are pure, distilled, highly filtered mineral oils, possessing a high fire test, low cold test, and are claimed to be unaffected by climatic changes. Three grades are provided for varying requirements. Under the same name is produced Miller's Pan-American transmission gear lubricant, also with low cold test and high melting points. This is made in three densities, light, medium and heavy, for transmission, sliding and planetary gears, respectively, the latter also being intended for cardan joints, ball and roller bearings, etc.

WOLVERINE LUBRICANTS COMPANY
WOLF'S HEAD

Lubricants: Eagleine No-Karbon and Wolf's Head.

Texaco.

Another oil which is guaranteed not to congeal at any temperature down to zero is the Texaco, produced by the Texas Oil Company, New York City, which has large oil fields in many sections of the country. Special filtration methods are employed for the purpose of entirely eliminating the carbon depositing features, thereby insuring that it will burn up cleanly after performing its legitimate function. The various grades are of uniform quality throughout and each is prepared with a view to performing its work perfectly under all conditions of service.

Panhard.

Panhard oil, made by George A. Haws, New York City, is refined exclusively from Pennsylvania crude and is held to be absolutely uniform in quality at all times. Six grades are provided, light, medium, heavy, extra heavy, special motorcycle and marine motor. They have been in the market since the automobile industry was in its infancy, and have been tested thoroughly in all classes of work. Other members of the line are the following: Panhard heavy gear oil for transmissions and differentials; gear compound, of similar design but of stiffer consistency; anti-fluid transmission greases, in three grades; cup grease, graphite lubricant and cork graphite compound.

Polarine.

It is not surprising that the Standard Oil Company, New York City, should have entered into the matter of producing automobile oils. With its vast resources in the production of crude oil, and its experience in handling oils of all character, it possesses an experience which should be of service in solving the problem of proper motor car lubrication. Polarine oil embodies all the resources and experience of this concern. As its name implies, it has a low cold test, flowing freely at temperatures down to zero. Special processes of distillation, pressing and reducing enter into its manufacture. Other members of the line are Polarine transmission lubricants, Polarine fibre grease and Polarine cup grease.

Wolf's Head.

The Wolverine Lubricants Company, New York City, produces Wolf's Head oils, these comprising a full line of cylinder and other lubricants, each prepared with special care and for a particular purpose. The basis is the best crude, and the process of refining is in charge of experts who have made a study of automobile lubrication since the very inception of the industry. The result is a cylinder oil in which the carbon producing feature has been eliminated and which will burn up cleanly under exacting conditions. Before being placed upon the market, the product is subjected to severe tests to determine that it measures fully up to the standard set by the concern.

Valvoline.

The Valvoline Oil Company, Boston, Mass., owns and operates three large refineries, in which Valvoline oils are produced from the best Pennsylvania crude. This crude is piped directly to the refineries through the company's own pipe lines, and it is claimed that the Valvoline Oil Company thus controls the product from the oil well to the consumer. The refining process is designed to eliminate the possibility of carbon deposits, and the product is not adulterated in any manner whatsoever. The cylinder oil is made in four grades, white, light, medium and heavy. In addition the line includes a solidified mineral oil for gears and differentials and a mineral grease for bearings.

ANNEALING STEEL.

Annealing or softening of steel is accomplished by heating the metal to a red heat and then cooling it very slowly to prevent it from getting hard again. The higher the degree of heat, the more it will be softened, until the limit is reached when the steel melts. It does not follow, however, that the higher the temperature the softer the metal will be when cooled, no matter how slowly, and this is proved by the fact that an ingot is always harder than a rolled or hammered bar made from it.

Nothing is gained by heating a piece of steel hotter than a good, bright cherry red. On the contrary, a higher heat has several disadvantages: First, if carried too far the steel actually will be harder than a good red heat would leave it. Second, if a scale is raised on the metal, this will be harsh, granular oxide of iron, and will spoil the tools employed in cutting. Third, a high scaling heat continued for a little time changes the structure of the metal, makes it brittle, liable to crack in hardening, and impossible to refine.

To anneal any piece of steel, heat to a red, uniformily throughout, taking care not to let the ends and corners get too hot. As soon as heated, take it out of the fire, the sooner the better, and cool as slowly as possible. A good rule for heating is at so low a red heat that when the piece is cold it will show the blue gloss of the oxide that was put there by the hammer or the rolls. Steel annealed in this way will cut very soft, harden very hard and without cracking, and when tempered will be very strong and will hold a keen, strong edge.

ANNOYING RATTLES.

Sometimes annoying noises which seem quite unaccountable proceed from the footboards of the driving seat. There is an occasional bang and then again there is a continual rattle which leads one to surmise that the boards are loose. As a rule this is due to the levers of the pedals. Where these pass through the holes cut in the floor, it may be that the clearance, particularly at the back, is very small, and if the lever be very loose upon its bearing it will rock to and fro, producing a chattering which is hard to locate, as it ceases when the car is stopped.

CLEANING CHAINS.

Although the chain driven vehicle is in the minority there are many of this type in use, some of which are utilized for business purposes. When properly cared for chains give good service, but on the other hand if neglected, considerable wear takes place and new members as well as sprockets will be required.

Chains should be well lubricated in the bearing surfaces and to accomplish this it is necessary to remove all dirt and foreign elements. An excellent method is to place them in a large receptacle filled with gasoline and wash them thoroughly. Then, melt mutton or beef tallow in another large vessel, and add a small quantity of fine graphite. Place the chains in this and bring to a boil over a slow fire. The hot material will penetrate to every crevice, lubricating each working part. The members are then hung up to allow the tallow to harden.

UTILIZED WATER IN LAMPS.

The motorist who is not lacking in inventive genius usually overcomes many seemingly difficult problems. One who was returning from the country early in the evening found his oil lights going out one by one, and at a time when without carbide for the generator. There was still some oil in the lamps but the wicks were short and did not reach the fluid. Drawing some water from the radiator he poured this into the kerosene raising the level sufficiently to permit relighting and resumed the journey.

RIVETING KINKS.

Rivets are commonly used in relining brakes, clutches, etc., and the novice is apt to choose a heavy hammer for peining over the head, wondering why he is not successful. The proper tool is a light hammer with which a number of light blows are struck, spreading out the end as desired. If a rivet were held rigidly in a tight hole a heavy blow would expand only the projecting end, but they are not usually so held, and the tendency of the heavy blows is to displace and force apart that which it is desired to bring together firmly.

YOUR EXPERIENCE WITH YOUR BUSINESS.

How Should Garage Charges Be Established?

A custom inaugurated with animal use and adopted by automobile public service stations in the absence of precedent or knowledge has established a monthly charge for care and protection, the price being minimum for simple storage and maximum for constant attention. There is no deviation (with rare exceptions) from the "dead" classification price, but with the "live" storage may be washing and polishing every day if used, or but an occasional cleaning. There is a very wide variance to the service that is given for "live" price. For the owner whose car is used occasionally the cost is decidedly more than for the man who uses his machine every day.

In any garage constant shelter and protection is worth a certain amount, and where practically there is no attention unless specially ordered the only foundation for a charge would be proportion of floor area occupied. Where the machine is washed, polished, dusted, and otherwise cared for daily it will be seen that an hour each day for this work would mean 30 hours a month, or practically three days' labor, that ought to be paid for by the man whose car is worked on. Allowing an average price paid for labor of 20 cents an hour, which is low rather than high, and a charge at 30 cents, a reasonable ratio, this shows that work that cost $6 has been sold for $9, indicating a profit of $3, less the cost of the water, polish, soap, waste, and other supplies used. There is the price paid for storage to be added to the bill.

With the machine that may be used half as many times as that which has been illustrated the profit on labor is $6 instead of $3 and there has been but half the value of supplies used, this being another considerable item. Taking these two to demonstrate the statement it will be found that with some the service is comparatively cheap, and with others it is relatively expensive.

Many cars are kept in private garages, convenience, economy and failure to secure the degree of satisfaction desired being some of the reasons. It is a good business proposition to make the garage attractive to the motorist, and when the charge for service is the fundamental it would appear that the problem is to more nearly equalize the expense rather than making blanket prices.

The opinions of garage managers and owners are especially desirable to logically consider this condition. It is a fair assumption that what we have can be improved upon and with a view to obtaining expressions from those who are active and interested, and whose knowledge is entirely practical, the editor invites written articles not exceeding 600 words dealing with the differing phases of the subject. These should be submitted within 30 days to "Garage Service Charges," the ACCESSORY and GARAGE JOURNAL. For the three most meritorious, prices of $5, $3 and $2, respectively, will be paid. The announcement of the names of those whose articles have been approved will be made in the May issue.

Source and Cost of Platinum—At present the price of platinum, such as used for spark plugs and other electric contact points, is $42 an ounce for hard and $41 for soft metal. This is the highest price it has ever reached. In 1905, the pure material was quoted at but $8.50 without much demand. The enormous increase in number of automobiles and use elsewhere, together with the failure to discover new fields, has combined to raise the price steadily. In fact, the present tendency is even higher. The chief source of supply is a mine or group of them in the Ural mountains,

Has the Automobile Machine Shop a Future?

When conducted in connection with the automobile garage the repair shop may be a department with fine equipment or have but indifferent facilities for meeting with the requirements of the work. There may be widely different conditions in the same community, for obviously much depends upon the management and the methods the vogue, yet there are well defined business principles that cannot be discarded, although they may be modified with reference to each particular instance.

The agent may be desirous of giving a certain service to his patrons, and he may install such machinery and tools as will make it possible for him to take up practically all work that may be necessary in ordinary repairs and restoration, but there are special works which must be sent to specialists, and which cannot be otherwise obtained. It should be understood that many changes are made in machines which require fittings and parts not stocked and perhaps in every way different than standard. The average garage may not be able to furnish these. While this is not the only reason for a machine shop devoted exclusively to automobile work it is one of the dependable sources of income to be relied upon.

There is much dependent upon the class of mechanics employed. Shops that do commercial work of all classes have not equipment suited for motor vehicle work and the workmen lack experience. All other conditions being equal the special work is to be preferred. This opens the way for the concern that can serve all or a number of the garages, insure a uniform class of work and material, and at prices which are moderate. The shop of this type lessens the need of garage equipment and the initial expense and consequent maintenance cost. It is possible for the automobile machine shop to do general work to whatever extent may be desirable, but it is always available and can, if occasion requires, turn out a rush order with celerity.

In the machine shop that is maintained poorly the tools may be indifferent and in broken sizes, stock may be poor or insufficient, and the character of the workmanship may be at least open to criticism. With the specialized shop the conditions are exactly reversed. The possibilities for concentrating the motor vehicle work of a community seemingly increase with the increase of the population to be served.

The subject seemingly has such merit as to justify careful consideration of the proposal, with regard naturally, to local conditions. The views of those experienced in the character of service suggested are so desirable that the editor of the ACCESSORY and GARAGE JOURNAL invites all readers to express themselves in articles of approximately 600 words, stating opinions as are warranted by knowledge. The character of the article may be specific or general. For the article having the most merit $5 will be paid, and $3 and $2 will be paid respectively for the second and third in order of merit. It is desirable that these be submitted within 30 days. The May issue will announce the names of those whose articles have been given preference.

Cleaning Brass Castings—To pickle brass castings, take three parts sulphuric acid, two parts nitric acid. Mix and add to this mixture one pint of common salt and stir until it dissolves. Use an earthen vessel and then dip the articles deep. Remove at once and rinse in clear water. This will clean and brighten the castings.

Should Car Commissions Be Uniform?

The conditions under which agencies have been established throughout the country differ materially. Many manufacturers assume they have unusually attractive propositions and allow small commissions, pleading the low prices and the high cost of manufacturing. Others establish a scale from a minimum to a maximum commission, assuming that the agent's commission will be increased proportionately to his endeavors. Another class has a general selling agent or several selling agents who establish agencies and when the original commission allowed by the manufacturer is divided between the selling agent and the agents the man who really sells the cars gets less than he would had he a direct agency. Several manufacturers give bonus on volume of business, this being a percentage proportionate to the total transactions consummated. The general disposition, however, is to give to the agents a stated commission and the agents in turn bear all the expense of marketing the cars delivered to them.

The selling cost differs materially. If the agent has a single car with which to demonstrate and makes headquarters at a garage he has much less chance for selling, but his expense is small. If he has salesrooms, salesmen, advertises more or less, has an office force and maintains a repair shop or a garage, his expenses accumulate rapidly. There are conditions between these two which may be found in practically every locality and where business differs materially.

The question presented when viewed from a purely commercial standpoint is what will be best for the development of the industry. Again much depends upon whether the agent sells pleasure or industrial machines, or both. Obviously the small commission will not always attract the man who is capable of doing a large business. Some hold that it requires as much salesmanship to sell the small car as the large. The scale commission is not attractive to the man entering into business, because he requires all the encouragement he can have financially. Where the sales agent and the agent divide the commission there may be a lessened return as compared with other propositions of about the same character. On general principle a bonus is a reward for endeavor and cannot be regarded as certain income.

The subject of selling is one in which every manufacturer and sales agent, as well as every agent, has decided interest. It is not to be assumed that there is protest made against any person or methods, but of all the plans that have been adopted there appears to be good reason to believe that so long as the cars are sold as they are there will be endeavor on the part of men who are qualified to serve as agents to select what will afford them the most certain and the largest return. This being so with a uniformity of method and proportionate revenue there would be greater prospect of constant and continuous representation, a condition greatly to be desired.

For the purpose of obtaining opinions as to what method has the most attractiveness and merit from the viewpoint of the agent, the editor of the ACCESSORY and GARAGE JOURNAL invites written articles from its readers expressing opinions based on experience. These should be of approximately 600 words and should be submitted in 30 days. For the three most meritorious, $5, $3 and $2 will be paid. The May issue will publish the names of those whose articles have been selected.

Heat Resisting Packing—To make durable and permanent joints between rough cast iron surfaces, mix asbestos and a small quantity of white lead sufficient to make a very stiff putty. This will resist any degree of heat and is not affected by steam or water.

What Class of Storage Custom Is Best Paying?

With the operation of an automobile for pleasure the expense is often found to be such that economy is naturally regarded by the owner, and one of the fixed charges is for storage in the event the machine is kept in a public station. The storage is usually divided into two classes; live, which is usually accepted to include cleaning (washing and polishing) after use, or dead, in which no attention is given aside from shelter and protection. The charges vary because of differing reasons and the character of service. With the live cars there is a certain income assured the garage, while with the "dead" machines, though there is a minimum charge there is additional revenue because of extra work.

With exclusive dead storage, however, it is not necessary that the garage management furnish attendance other than to insure against theft and the like. With live storage washing and polishing means work that must be done regularly as often as desired, a rather uncertain demand in one sense, and constant attention. Some cars are used at all times and others are used but little during certain periods of the year, which increases the uncertainty.

It is the general experience that the proportions of the two classes differ materially during the year and that with many owners the service varies from the one to the other to best meet convenience. Because of the varying return from cars which are either "live" or "dead" at pleasure and the fixed charges of the garage, the income of the station is less per car than may be estimated by average, and this cannot be provided for unless the charges are made entirely on the basis of storage alone and other charges for cleaning according to the work performed, or the prices uniformly increased.

There are many garage managers who find that there is little, if any, profit in dead storage, but who are forced to accept such business with the expectancy that the customers may eventually become identified with the other class. There have been many experiences and convictions formed as to the productiveness of the two classes with reference to garage facilities and garage income, and it is for the purpose of obtaining such opinions that the editor of the ACCESSORY and GARAGE JOURNAL invites the readers to submit articles dealing with the subject. These should not be more than 600 words in length and may deal with any aspect that may be desired. These expressions should be submitted to the attention of "Storage," the ACCESSORY and GARAGE JOURNAL, and all articles must be received within 30 days. For the most meritorious review of the subject the price of $5 will be paid, and prices of $3 and $2, respectively for the second and third best considerations. Announcement of the names of the authors whose articles have been selected will be made in the May issue of the magazine.

GAS TANK PRESSURE.

Many motorists complain of the low pressure registered by the gauge on their gas tanks during cold weather and the following explanation is given by the Prest-O-Lite Company: "The correct pressure should be 225 pounds, or 15 atmospheres at 65 degrees Fahrenheit. When the tank is chilled this drops rapidly. A decrease of 49 degrees temperature causes the pressure to drop one-half. Nine to 10 atmospheres or 135 to 150 pounds pressure in cold weather is not unreasonable. To prove this, place the device in a room of normal temperature for one day and note the result."

WHO'S WHO IN THE INDUSTRY.

EDWARDS IS MARQUETTE MANAGER.

Clifton C. Edwards, Manager Marquette Boston Branch.

Clifton C. Edwards, well known to motorists throughout New England, has been appointed manager of the Boston branch of the Marquette Company, maker of Marquette cars, at 733 Boylston street. He assumed his new duties immediately preceding the Boston show, and was busy throughout that exhibition receiving the congratulations of his many friends who visited the Marquette display.

Mr. Edwards has been connected with the automobile industry for a number of years. For the past two years he has been connected with the E. R. Thomas Motor Car Company, Buffalo, N. Y., representing the Thomas car in the South and in Mexico. Previously, he was associated with the sale of Panhard cars in New York City.

DICKSON BELIEVES IN QUALITY.

George M. Dickson, General Manager, National Motor Vehicle Company.

George M. Dickson, general manager of the National Motor Vehicle Company, Indianapolis, Ind., whose likeness is shown herewith, believes in Quality with a capital Q. Mr. Dickson is a graduate from the bicycle industry, and even his competitors were compelled to admit that he understood the selling end of that business. Despite the fact that he is still young in years, he is a veteran in the manufacture of motor vehicles, having been connected with the production of National cars for a number of years and general manager of the company for some time. Like most successful men he has some very well defined ideas as to how the automobile business should be conducted. After 12 years of experience he is justified in feeling that he can offer a few suggestions, and among these is that of Quality. Mr. Dickson says that no matter how large the factory may be, and no matter anything else, a motor car must be measured by but one standard—Quality. He adds that even if the builder wanted to unload an inferior product upon the people he would be unable to do so, because the public is now motor-intelligent. He also takes comfort in the fact that every day sees the sum total of motor-intelligence increased, and holds that this is the salvation of the industry.

JOINS ABBOTT MOTOR COMPANY.

Clinton E. Bailey, Vice President, Abbott Motor Company.

At a recent meeting of the directors of the Abbott Motor Company, Detroit, maker of the Abbott-Detroit line, Clayton E. Bailey of Jamestown, N. Y., was elected first vice president of the company and chairman of the board. For several months past C. W. Jamieson, president of the company, has been seriously ill and his condition is regarded such as to compel the selection of a man capable of assuming direct charge of the business.

Mr. Bailey has been associated in other business enterprizes with several of the principal stockholders in the Abbott company for a number of years, and recently acquired a heavy financial interest in this concern. He is well known in New York City as a financier and manufacturer and brings to the Abbott company a wide knowledge of business methods.

For several years he has been president and the moving spirit in the Bailey Table Company at Jamestown, one of the largest and most successful furniture manufacturing establishments in that section. He also has been closely allied with the management of numerous other manufacturing and financial institutions in that city. In addition he has large financial interests in the Southwest and has shown a very considerable amount of strength in handling transactions involving large capital with business interests in New York City.

It is anticipated that Mr. Bailey's policies, which are conservative and at the same time progressive, will continue to develop the business of the Abbott Motor Company and cause it to become one of the best manufacturing concerns in the industry. It is Mr. Bailey's intention to remove his family to Detroit and take up his permanent residence there in the immediate future.

MAGNETOS FOR GAS ENGINE SERVICE.*

Principles Involved in the Design of Standard Instruments, Features of Construction and Conditions Essential to Efficient and Continued Operation of This Generally Adopted Source of Electric Energy.

(Continued from February Issue.)

The method of operation of the independent system is by what is known as the closed circuit plan, the armature being short circuited while the contact points are closed, though as soon as the circuit is broken, the current generated in the winding must take the longer path which includes the primary of the induction coil. Thus, as soon as the points separate, there is a sudden rush of current through the transformer, and a high-tension current is produced in the secondary as previously described.

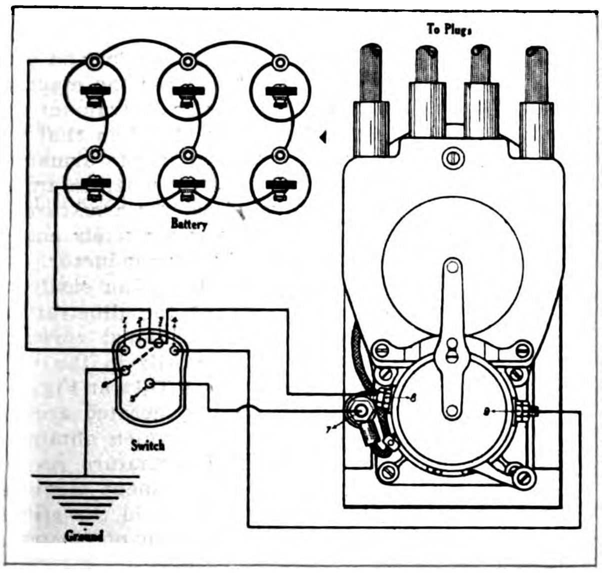

Fig. 18—Wiring Pfanstiehl Dual System.

When used in connection with a set of batteries, there is a slight change in the contact breaker, consisting of adding another terminal 9, as shown in diagram Fig. 18. This makes three terminals, 7, 8 and 9 as indicated, whereas the magneto, when used alone requires but two.

The location of the transformer coil makes it possible to cut it in either a battery or magneto circuit, depending upon the switch lever position. We have seen that one end of the coil was grounded, while the other end is brought out to terminal 7, which is coupled to terminal 5 at the switch, this making contact with the switch arm. Connections 4 and 9 carry current from armature to switch, and the wire leading from 3 to 8 permits the magneto to operate as a self-contained instrument when the switch lever is in magneto position. One end of the battery is connected to point 3, the other to terminal 1, but as the circuit is open when the switch lever is either in magneto or off positions, the battery is inoperative at this time. The wire connecting switch terminal 3 to contact breaker terminal 8 forms the connection whereby the armature current is intermittently connected and separated by the breaker points.

When the switch lever is thrown to battery side, coil connection 7 is placed in circuit with 5 and 1, making it possible for the battery current to flow to the coil. In longitudinal section shown at Fig. 17, in February issue, connection A corresponds to and is coupled with terminal 7. The other battery lead is intermittently grounded at terminal 8. A push button is provided at the side of the switch for starting, when this is depressed the ground connection 6 is brought into electrical connection with point 3, and the battery current is grounded through a short shunt instead of by the contact breaker points at terminal 8. With this system one taps the button instead of maintaining a continual contact as with the vibrator previously described. Attention is called to the method of battery connection advocated by the Pfanstiehl engineers. While six cells are used, one utilizes only the voltage of two cells because of the series-parallel connection. This is sufficient as the resistance of the primary of the transformer coil is so proportioned that the core is energized with very low potential current.

In the Pittsfield magneto, the current is produced by transforming mechanical energy into electric power through a distinctive principle depending upon induction. The rotating member employed, as can be seen at Fig. 19, which depicts a longitudinal cross section, or at Fig. 20, a lateral section, is an inductor composed of laminated iron sections. This revolves through a magnetic field formed by permanent steel magnets. The winding, instead of being on the inductor, is placed at the back of the instrument and is stationary. It is a complete transformer coil in itself and is so placed between the pole pieces that it may be easily removed, core and all, and a new one substituted should this be necessary because of damage. The coil consists of two windings, a primary and secondary, and the principles of operation are the same as in those previously described, and the high-tension current is distributed by the usual means. The contact breaker is located between the coil and the bearing plate of the inductor, and is easily reached by removing the transformer.

Referring to lateral cross section Fig. 20, it will be seen that the field has four pole pieces instead of two as in the usual type of instrument. Two of these are attached in the conventional manner to the magnets, the others, together with the iron core of the transformer coil, are also in the magnetic field. The rotation of the inductor in the field serves to reverse the flow of magnetism alternately from the magnets to the pole pieces forming a magnetic circuit with the transformer coil core. While it is possible to obtain a change in magnetic strength four times a revolution,

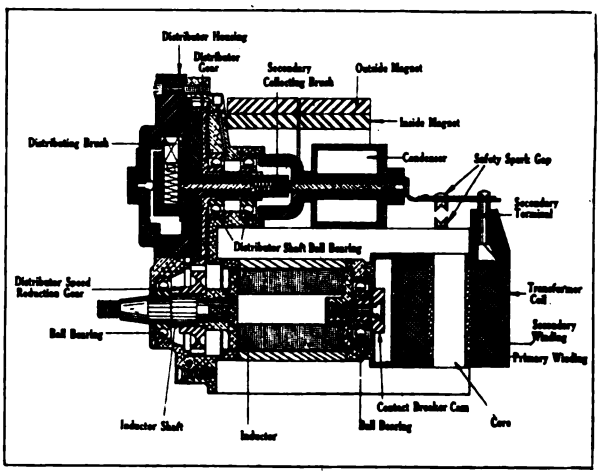

Fig. 19—Pittsfield Inductor Magneto Employs Stationary Winding and Works on Distinctive Principle.

---

*This article, which is descriptive of a number of the best known magnetos to be found in the market, and which are standard with motorists, is reproduced from the "A B C of Magneto Ignition Systems," one of the series of Standard Handbooks of Automobile Mechanics published by The Automobile Journal Publishing Company.

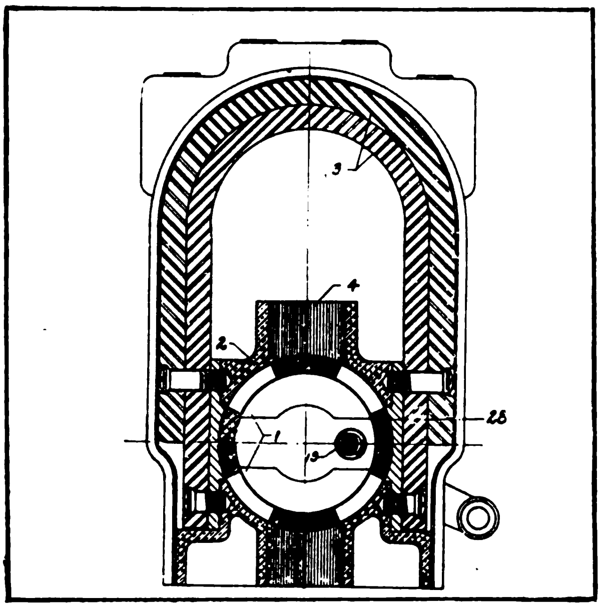

Fig. 20—Lateral Cross Section Pittsfield Magneto.

or for each 90 degrees rotation of the inductor instead of for every 180 degrees as in other instruments, a two-point cam is fitted to the revolving member and the maximum current is obtained but twice each revolution, so that the magneto may be run at twice the crankshaft speed when applied to a four-cylinder engine, just as other makes. When the magnetic flow reaches its maximum in the coil core, the contact breaker points separate and a high-tension impulse is obtained in the secondary coil of the transformer.

The timing arrangement is different from that of other magnetos, and it is claimed that a variation of timing of 30 degrees is possible without reducing the efficiency of the spark, which is the same either at maximum advance or retard. The change of timing is effected through changing the position of the coil field poles by means of an oscillating sleeve on which the interruptor is fastened, this being actuated by the spark advance lever. The sleeve consists of four pole pieces of magnetic material mounted between ends of non-magnetic metal, and when oscillated serves to distort the magnetic flux, and at the same time, causes the contact points to separate sooner or later in relation to the engine piston travel and thus vary the time of sparking in the cylinder. The effect of changing the position of the sleeve pole pieces is exactly the same as though the main pole pieces shifted to the maximum magnetic flux would flow through the transformer coil core when the contact points were separated regardless of the time of breaking the circuit relative to the crankshaft travel.

Wiring Pittsfield Magneto Systems.

The Pittsfield magneto is intended to be used either as a single source of ignition, in which case it is coupled to the engine in just the same manner as any high-tension device, or as one group of a double system in which a separate battery timer and coil as well as a distinct set of plugs is provided either for starting or regular use. The diagram Fig. 21 shows the wiring of such an ignition method. The various parts should be easily distinguished, but as a guide letters are used as follows: A, magneto; B, battery timer; C, magneto and battery switch; D, spark plugs; E, four-unit vibrator coil; F, batteries; G, ground; H, battery switch connection; K, magneto switch connection; a, secondary lead from magneto to plug; a 1, conductors from coil to plugs; b, primary lead from magneto to switch; b 1, wire from switch to batteries; c, connections between timer and coil, and e, conductors from coil to batteries. Considering the matter previously presented, it should not be difficult to trace the wiring of either the battery or magneto systems.

We have considered magnetos of the high-tension type in which the low-tension current produced in the single winding of the armature was stepped up to one of higher value, in a separate transformer that was mounted on the dash in one instance, or formed part of the magneto as it was housed between the magnets in other forms. The true high-tension instrument differs from the forms previously considered in that the current of high voltage is produced in the armature winding direct, without the use of a separate transformer. Instead of a single winding, the armature of such devices carries two, one of comparatively coarse wire, the other of many turns of finer conductor.

The arrangement of these windings can easily be ascertained by reference to any of the illustrations presented herewith that show the sectional views of typical high-tension magnetos, especially in the view of the Bosch D4 at Fig. 22 and Bosch DU4 at Fig. 23. The current in such instruments is generated according to the same principles as those which obtain in the low-tension devices, the shuttle armature revolving between the poles of strong permanent magnets. The rotation of the armature windings in the strong magnetic field results in the production of electrical energy by induction.

How Bosch Magnetos Operate.

If we refer to Fig. 24, which is a diagram of the principal parts of the Bosch DU4 magneto, the mode of operation can easily be determined and the principle involved can be applied just as well as to other instruments of the same type. The armature is shown separate from the magneto so the wiring can more easily be understood. It is well to remember that the current is produced in the armature winding twice each revolution, or at intervals of 180 degrees rotation, therefore one may obtain a spark each half revolution of the armature of a four-cylinder magneto.

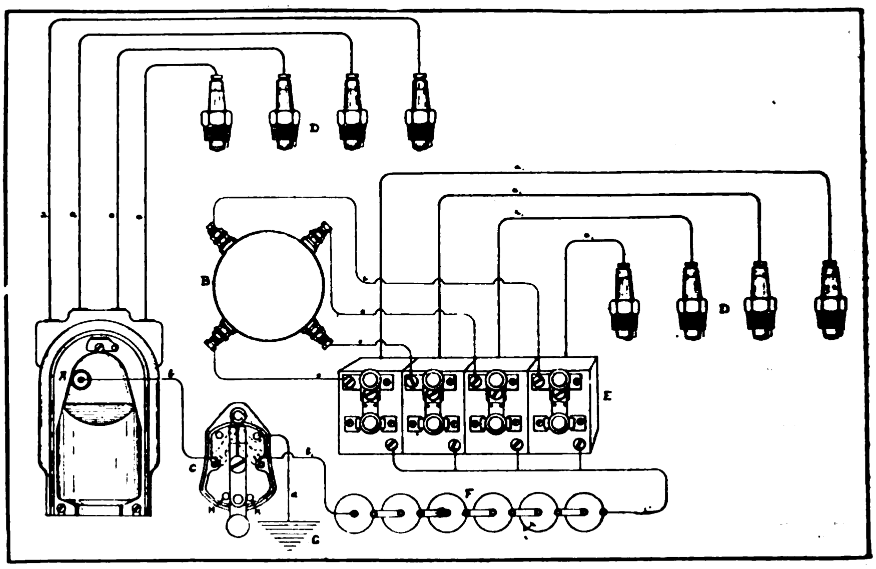

Fig. 21—Pittsfield Magneto Used in Connection with Battery System.

The shuttle is wound with two windings, one being a continuation of the other. Of these the inner winding, indicated by the coarse lines C1 is the primary consisting of a few turns of heavy wire, while the other, C2 is the secondary coil consisting of many turns of fine wire. One end of the primary winding is coupled to and is grounded to the armature core; the other passes to the insulated part of the interrupter. While in some forms the interrupter does not revolve, the desired movement to separate the contact points being produced by a cam mounted on the armature shaft, in the form shown, the contact breaker mechanism turns with the armature and the points are separated by cams on the timer casing operating a trip lever to which one of the platinum contact points g3 is fastened. The insulated member g2 is adjustable in the supporting block so the distance between the points may be varied to obtain the best results and so the gap between them when they are separated by the cam can be maintained the same even when they flatten out a little after constant use.

Utility of Contact Breaker.

This arrangement of having a revolving contact breaker mechanism and normally stationary cams permits one to conduct the current from the revolving primary coil to the interrupter by a direct connection, eliminating the brushes that would otherwise be necessary. During the revolution of the armature the grounded lever makes and breaks contact with the insulated point, short circuiting the primary winding upon itself until the armature reaches the proper position of maximum current production at which time the points g2 and g3 are separated by the cam. Normally, the contacts are together and the currents generated in the winding, which are comparatively feeble, have no effect on the secondary coil because the primary winding is short circuited upon itself, flowing through the conductor "f" to the insulated member and thence back to the ground through the grounded contact lever.

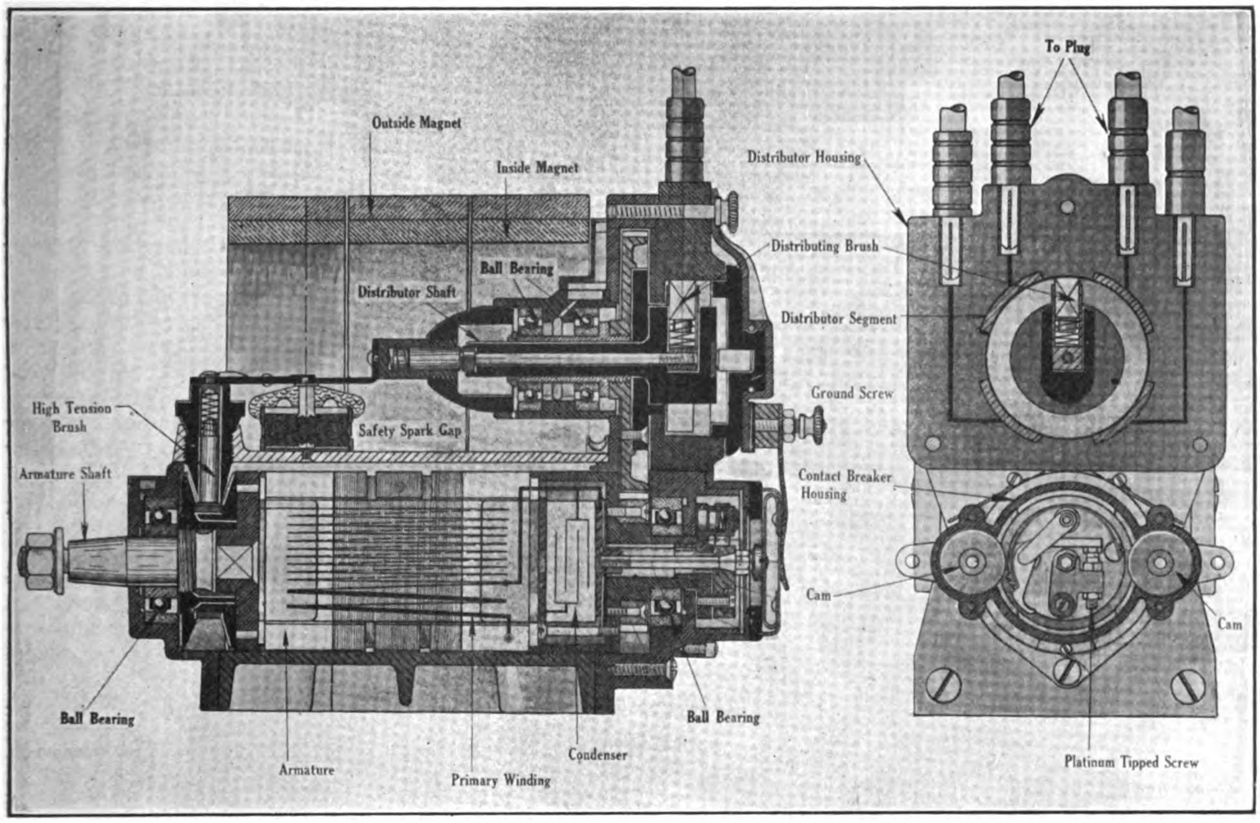

Fig. 22—Sectional Views of Bosch D4 True High-Tension Magneto, Which Employs Double Armature Winding.

The arrangement of the secondary winding is also shown in the diagram, one end being attached to the live end of the primary where it joins the conductor leading to the insulated contact point g2, while the other is coupled to the collecting ring carried by the insulator at the driving end of the armature. A carbon brush collects the high-tension current, and by means of the conductor "1" it is delivered to the revolving brush of the distributor n1.

It will be evident that as long as the contact points are together, providing a short circuit for the small currents induced in the primary there will be no production of high value current in the other winding. When the current reaches a maximum value, because of the armature being in the best position, the cam operates the interrupter and the points are separated, breaking the short circuit that existed while they were together. The secondary circuit has likewise been open while the distributor arm has moved from one contact to another, and there has been no flow of energy through this winding. While the pressure will rise in this, even if the distributor arm made contact with one of the segments, there would be no spark at the spark plug until the contact points separated, because it is only when the armature is at the position of maximum current production that the secondary current has sufficient value to overcome the resistance of the air gap between the plug electrodes.

How Spark Is Produced.

When the air gap exists between the contact breaker points the maximum primary current is diverted from the short circuit and can flow to the ground only through the secondary winding and the spark plug circuit. The high pressure now existing in the secondary winding will be greatly augmented by the sudden flow of primary current and electric energy of high enough potential to successfully bridge the gap at the plug is thereby produced in the winding, which is diverted to the cylinder to be fired by means of the distributor mechanism.

As the arc-like spark can only be produced when the armature is in a certain position and as the ignition has to take place at a certain period in the movement of the piston, it is necessary that the armature be positively driven at the same speed as the engine when the magneto is applied to a four-cylinder engine of the four-cycle type. The gear wheel that carries the distributor carbon brush n 1 is so arranged that it revolves at the same speed as the camshaft of the motor. The variation of the time of ignition is effected on the magneto itself by means of the timing

lever p, which rocks the contact breaker housing in which the cams are carried so that the interruption of the primary current short circuit will take place earlier or later as the case may be.

Function of Safety Spark Gap.

All modern steam installations are provided with a safety valve so that if the steam pressure in the boiler becomes so high that the safe factor of strength of the boiler tubes or shell is likely to be exceeded, a portion of the pent-up steam will be released to the outer air. Owing to the high-tension of the secondary current, magnetos are provided with a device that acts in the same manner. If by chance a spark plug wire should become broken, the pressure of the electrical energy in the windings would be sufficient to rupture the insulation in seeking a short path to the ground.

To guard against the damage from this cause, most high-tension magnetos have a spark gap, this consisting of two points, as outlined at k, Fig. 24; one being connected to the secondary conductor that leads to the distributor brush, the other with the ground as represented by the metal housing of the magneto. As long as the current can pass over a gap having less resistance than that of the air space between the safety spark gap points, possible as long as the leads to the spark plugs are properly connected, the spark gap is inoperative. Should a wire become loose and sufficient current be generated to damage the windings, the pressure is high enough to permit the electric force to overcome the resistance of the air gap and pass to the ground. Most devices of this nature are set so current in excess of 14,000 or 15,000 volts will jump the gap. When a transformer coil system is used, the safety spark gap is often located on the coil box. In the true high-tension magnetos it is commonly placed between the magnets as indicated at Figs. 22 and 23.

Why a Condenser Is Needed.

The condenser, which is often carried with the armature, consists of a number of conducting surfaces in two sets, those of one assembly being insulated from those of the other by mica or other insulating material. Its purpose is to absorb excess static charge present in the spark or arc, which is evidenced when the points are separated. The location of this essential varies with the design, some makers mounting it on the armature, which, of course, eliminates sliding contacts, as at Figs. 23 and 24, while others place it between the magnets on the top of the pole pieces. If a condenser were not provided, the static effect of the current would tend to burn the contact points because of the intense heat, the temperature of the arc occurring between them being sufficient to fuse the platinum.

To interrupt the operation of this type of magneto, one permanently short circuits the primary winding. This is accomplished by an insulated wire connected from nut r 1 to the switch, the other pole of the latter being connected to the motor frame or ground. As soon as the switch lever is closed the current passes over the contact r 1, the spring r 2 and the switch and wiring leading to it from the magneto and from the switch to the ground and the action of the contact breaker has no effect upon opening the circuit.

Bosch Dual System Outlined.

The Bosch magneto is made in many types and sizes, the most popular for large cars being that shown at Fig. 22, while a type that has received wide application on smaller and lighter cars is that outlined in the large plate, Fig. 23. The most popular arrangement of these instruments when used for automobile ignition is either in connection with a "dual" or "duplex" ignition system.

The DU4 magneto, when applied in a dual system, differs from the regular independent type in several details. One of the first to be noticed is an additional binding post on the face of the distributor, this serving to conduct the high-tension current from the switch to the distributor, whether the current of high potential originates in the magneto or in the coil. In the type shown at Fig. 23 the high-tension current is led from the armature to the distributor brush by a conductor that is located under the arch of the magnets. One of the changes necessary on the magneto to use it for the dual system is to break this circuit, as the secondary current should flow to the distributor from but one source at a time.

The details of the interrupter are also different, as will be evident from examination of the contact breaker. It will be noted that a second lever is located under contact breaker housing in a separate housing, the function of this being to interrupt the battery circuit. Whereas the parts of the magneto contact breaker turn with the armature and are operated by stationary cams, the battery timing lever is stationary and is operated by a revolving cam that is located directly behind the disc that bears the parts of the magneto interrupter. The magneto and battery cams are set at such relation to each other that the interruption of the battery and magneto circuits are simultaneous. The coil that is utilized in connection with the battery is intended to be used in a horizontal position and is located on the dash of the car. The only part of the device that is visible from the seat is the end plate carrying the switch handle.

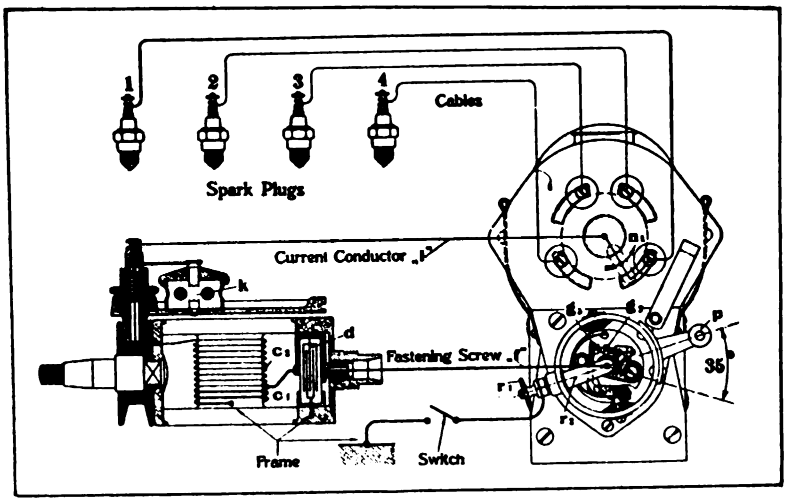

Fig. 24—Principle of Bosch High-Tension Magneto Action.

Under normal conditions the operation of the engine with the switch thrown to battery position will be due to the production of a single spark, which occurs in absolute synchronism at the instant the circuit is broken by the battery timer. In order to permit self-starting, however, the coil is provided with a vibrator that may be brought in action by pressing a button independently of the battery timer. A four-cylinder engine will usually stop with the crankpins in a horizontal position; that is, the piston in the cylinder about to fire is part of the way down on the power stroke. Just as soon as the vibrator button is pushed, a spark takes place regardless of the contact breaker lever position and if there is any explosive mixture in the cylinder, ignition will result and the engine will start.

(To Be Continued.)

CAUSES OF BLOWING EXHAUST JOINTS.

A clogged muffler will develop trouble and this reducer of the exhaust noise is responsible for faults usually laid to other components of the power plant. Sometimes it is difficult to fit packings in the joints of the exhaust manifold when these members are not parallel. This may be due to the cylinders not being lined up where multi-members are cast singly, and fitted over studs in the crankcase. In tightening up the manifold one or more packings may not be compacted as snugly as the others and these will leak in time, which is denoted by a hissing noise. It may not always be the fault of the work and may be brought about by the muffler being stopped up and creating a strong back pressure in the manifold and at the joints. When such is the case there is a tendency to blow the packings. This also may be caused by the opening of the latter being made smaller than that of the port.

104 Broad Street, Boston, Mass.

FORD OWNERS

Improve the running of the car wonderfully by the

Pedersen Oiling System

which is simple, strong, positive, and easily applied. It has only two moving parts; no twisting of the cam shaft, no belting to stretch, burn or loose. With adjustable indicator on dash board not under the hood, the working of the oiler can be observed from the seat.

Pedersen Lubricators are in use on more different cars than any one make of lubricator.

GREAT AGENCY PROPOSITION

Prominent, well established Automobile manufacturer, producing popular priced, high powered, refined line of Cars, wants several high class, up to the minute, experienced salesmen in all parts of the United States,—either salary or liberal commissions paid,—nothing but high class men will be considered and they must understand their business and be available July 1st. Application must give State experience, bank and business references. No man over forty years of age will be considered. Address General Sales Manager, care this paper.

HOPEWELL
TIRE CASE

ABSOLUTE TIRE PROTECTION
GIVEN ONLY BY THE
Hopewell Tire Case

It prevents any water entering the spare tire (either from rain or hose used in washing.) Water rots the fabric and causes blowouts.

$3.00 to $4.00 according to size

Hopewell Brothers Newton, Mass.

New Departure "TWO-IN-ONE" Ball Bearings

The only ball bearing that takes load from any direction with equal efficiency.

THE ACCESSORY AND GARAGE JOURNAL
Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. I. PAWTUCKET, R. I., APRIL, 1912. No. 6

NEW FACTORIES INDICATE PROSPERITY.

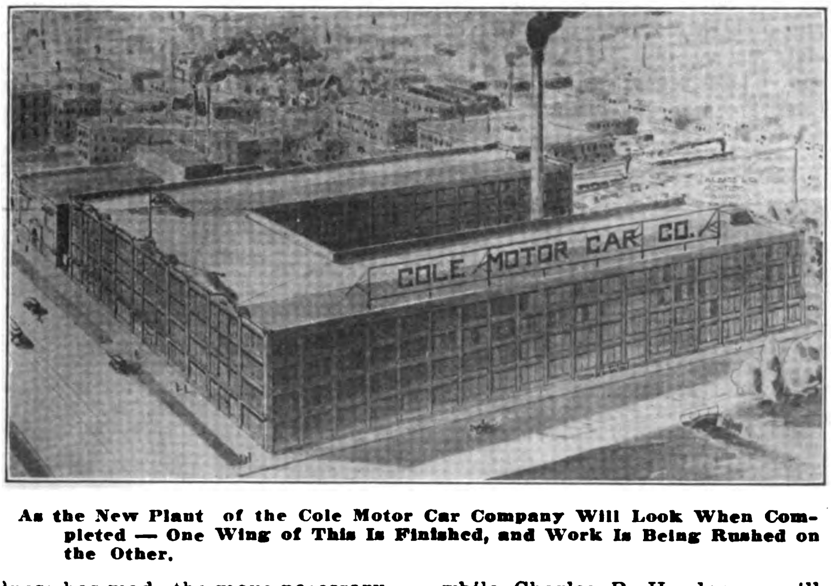
Condition of the Industry Is Reflected in the Erection of Substantial Structures to Take Care of the Increasing Business of Five Well Known Firms Producing Motor Cars, Parts and Accessories.

NO BETTER evidence of continued prosperity, having in mind particularly the automobile industry, is needed than can be found in the demand for additional production facilities. Several concerns throughout the country have found it necessary to erect substantial additions to their plants, and as it is generally admitted that there is a tendency among manufacturers in any line to be more or less cautious during an election year, any news of expansion along this line at this time is of special interest to those in the trade.

The plans of at least five firms in three states have progressed sufficiently to admit of presenting their details herein. Indianapolis, Ind.; Hartford, Conn., and Jamaica Plain, Mass., each will have a new factory, and it is estimated that the total cost of these three structures will reach close to half a million dollars. In each case, the firm's increased business has made the move necessary.

In Indianapolis, the Cole Motor Car Company, maker of the Cole car, has just occupied the first wing of its new factory, and construction is being rushed on the other wing. The one just finished cost $100,000 and the second wing will be a duplicate of the first. Each will be four stories high, of reinforced concrete in an especially light and airy construction. They will be 100 by 160 feet, in the rear of factory No. 1. When both are completed the Cole organization will have a U shaped building 230 by 315 feet, four stories high. The foundations and walls have been so designed that two stories may be added at any time, whenever the pressure of orders makes it necessary. The Cole company has three other buildings in Indianapolis, all working to their full capacity, so the fact that the addition was necessary gives some idea of how the prospects for the future look to the Cole people.

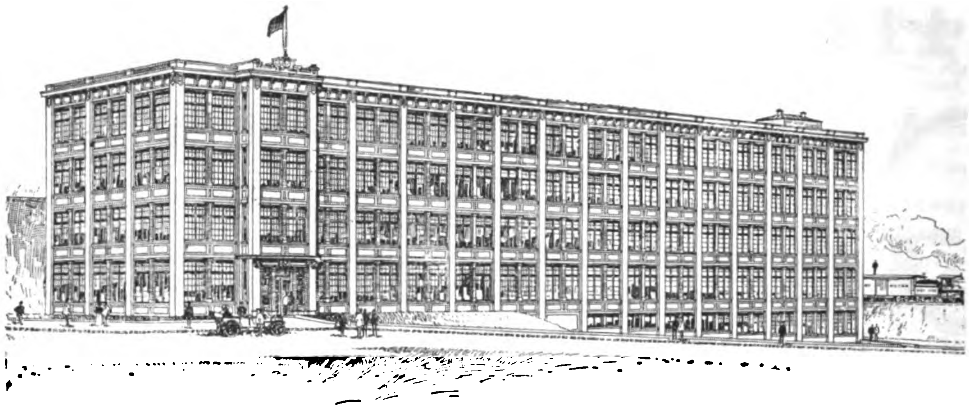
It will be remembered in this connection that the Henderson Motor Sales Company, which has been the distributing agent for the Cole product since the organization of the company, has been purchased by the Cole Motor Car Company, and will become the sales department of that organization July 1. This does not mean that there will be any decided change in the management of this end of the business. President J. J. Cole will continue in direct personal charge of the production while Charles P. Henderson will be retained in his new capacity as sales manager.



COLE MOTOR CAR CO.

As the New Plant of the Cole Motor Car Company Will Look When Completed — One Wing of This Is Finished, and Work Is Being Rushed on the Other.

In Hartford, Conn., the Pope Manufacturing Company, maker of the Pope-Hartford cars, is to erect a big modern four-story building that will double the output of the factory. The erection of this will mean an important addition to the company, and to the city of Hartford as well, and will be of interest to the automobile trade as an indication of how the Pope forces are preparing for expansion. The number of hands employed will be increased by several hundred.



Modern Concrete Factory Building to Be Erected in Jamaica Plain, Mass., and Occupied by the Randall-Faichney Company, the Mac-Kae Manufacturing Company, and the Babson-Dow Manufacturing Company.

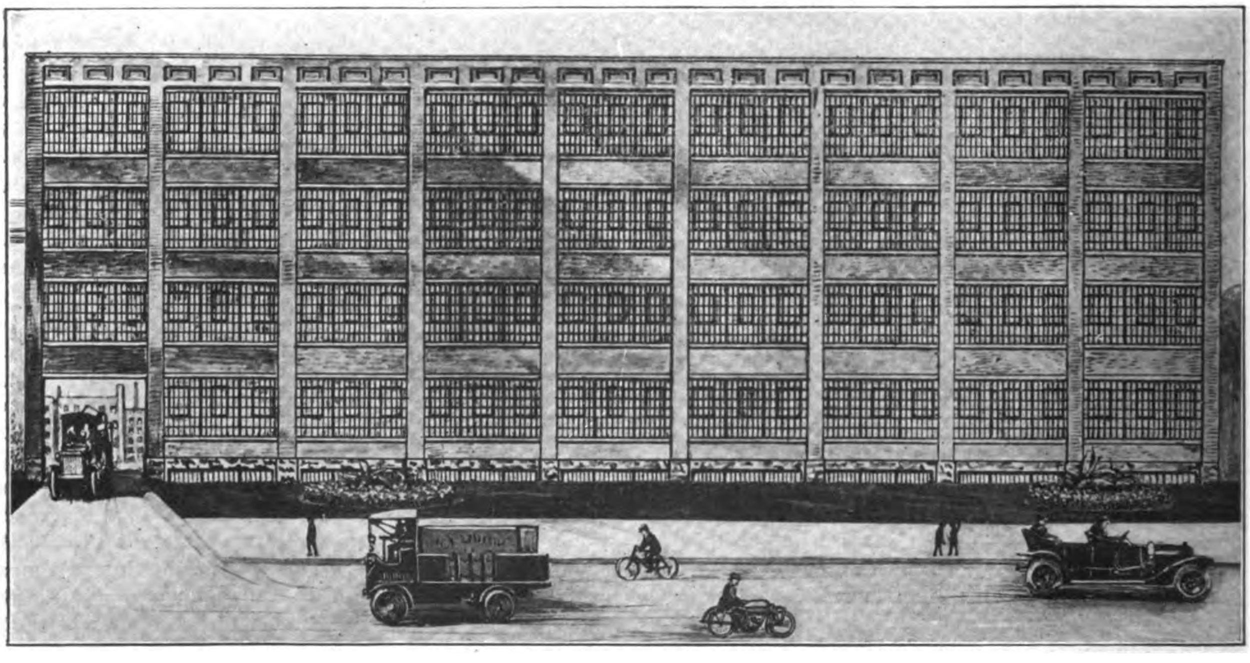
Plans for the new building have been drawn, specifications have been finished and placed in the hands of contractors for bids, and it is expected that construction will be started shortly. It is hoped to have the work completed by September, if not before, as it is to start in June. That the company is badly in need of more space may be seen in the fact that the superintendent's office, at present in the factory, will be moved in June into the rooms of what is now station A of the postoffice, which is to be located elsewhere. The new building will extend from the eastern face of station A to the driveway near the main office building, and will connect with the present factory office.

The new structure will contain four stories and a basement, and will cover an area of 192 by 72 feet. The elevators, stairs and toilets are to be located outside in a tower, which will be fire proof, affording a fire escape of the most approved pattern. The convenience and comfort of the employees have been carefully considered, and large windows fitted with steel sash will admit plenty of light and air. The columns will be widely spaced, and the floors will be shallow and girderless. The basement, into which cars will be run under their own power down a runway from the yard, is to have a special ventilation system that will remove all vapors and gases, discharging them through the roof. The ceilings will be flush, eliminating pockets in which gases might collect. Two large elevators, the largest in the city, will be installed. They will have platforms 25 feet long, and will safely carry a loaded truck weighing 10 tons.

The third factory is to be built in Jamaica Plain, Mass., and will be occupied by three firms, all making automobile parts and accessories. The building will be owned by the Randall-Faichney Company, which will occupy the larger portion of the space. This concern is well known in the industry, making a large line of accessories, of which the Jericho horn is perhaps the most prominent. It also produces oil and grease guns, and makes a specialty of precision work.

The Mac-Kae Manufacturing Company will occupy a part of the new structure, where it will continue the production of the well known Mac-Kae spark plugs, terminals, timers, and other electrical accessories, as well as tire holders, tools, etc.

The other concern which has secured space in the new building is the recently organized Babson-Dow Manufacturing Company, which will place in the mar-



The New Pope-Hartford Plant in Hartford, Conn., Which Will Double the Output of the Company.

ket a complete line of screw machine products in all metals. The general manager of the new concern, which is capitalized for $100,000, is Rodger D. Babson, who has had wide experience in the automobile industry. He was until recently the Boston agent for the Hartford Machine Screw Company. The factory will be in charge of Mr. Dow, who was for 15 years in charge of the machine screw department of the United Shoe Machine Company.

The building will be erected on Atherton street near Boylston station and along the railroad, so that ample facilities will be afforded for shipping the products of the three concerns. It will be four stories high, 60 by 250 feet, with basement, and will contain a total of 67,000 square feet of floor space. The exterior, as may be seen from the accompanying illustration of the architect's drawing, is pleasing, and it may be stated that the interior will be in keeping. Every modern convenience for the dispatch of business and the health and safety of the employees will be provided, and the factory will be a model one in every particular.

Light and power throughout will be electric, and the installation is being planned by electrical engineers who will produce an ideal equipment. Current will be furnished by the Edison Electric Illuminating Company. While the factory will be near the railroad, one end adjoining the right of way, a lawn with flower beds and shrubbery is planned, with the idea of making the external appearance as creditable as possible for the occupants and the town as well.

CONCERNING GRAPHITE AND GREDAG.

In the March issue of the Accessory and Garage Journal, one of the cut lines in the article dealing with the various lubricants produced by well known manufacturers was unfortunately so worded as to convey a possible misunderstanding. Reference is had to that reading, "Lubricants: Dixon's Graphite and Gredag." The illustration was that of two cans containing graphite products, the first being Dixon's Graphite, produced by the Joseph Dixon Crucible Company, Jersey City, and the other, Gredag, made by the International Acheson Graphite Company, Niagara Falls, N. Y. It is unnecessary to state that there was no intention to convey the impression that Gredag was manufactured by the Dixon concern, and the article accompanying the illustration explained this matter clearly. However, the wording of the cut line was such as to occasion some confusion.

UNUSUAL CARBURETOR TROUBLE.

The use of a chamois or a screen fine enough to prevent the passage of water in replenishing the fuel supply is more essential in winter than during warm weather because in some types of carburetors the water is likely to collect and freeze, creating starting troubles. An instance of this kind was noted recently.

The vaporizer was an old one and the cork float was contained in a separate chamber from the spraying nozzle, and was fitted with a threaded stem, the lower end of which became locked in a mass of ice caused by an accumulation of water in the fuel. It is needless to state that the operator of the car experienced considerable trouble before he located the cause.

THE INDUSTRY IN NEW YORK.

According to an advance bulletin on manufactures for the State of New York, based upon the 13th census, and issued by the Department of Commerce and Labor, the automobile industry in that commonwealth arose from 126th place in 1899 to 73rd in 1904 and 23rd in 1909. These figures show that the number of establishments engaged in the manufacture of automobiles, bodies and tops has increased from 15 to 113 in 10 years, and that the capital involved has been increased from $639,000 to $25,102,000. Of course, it must be remembered that these figures are now more than two years old, and many changes undoubtedly would be revealed were it possible to secure a similar report for 1911.

In the accompanying tabulation is presented the statistics for the entire state, and for the cities of Buffalo and New York. Automobiles are manufactured in several other cities, but the amount of business transacted does not appear to have warranted segregation in the report of the census board, and the figures are included in the item "All other industries." The compilation will be of interest to motorists, not only because it shows the growth of the motor car industry in New York, but as an indication of the growing importance of the manufacture of cars throughout the entire country. The tabulation follows:

State of New York.

	1899	1904	1909

MORRIS GRABOWSKY RESIGNS.

According to a dispatch from Detroit, Morris Grabowsky of the Alden Sampson Company, which is a constituent of the United States Motor Company, has resigned, the resignation taking effect May 1. Mr. Grabowsky had been with the Sampson since the factory was purchased by the selling company, and previously had been identified with the Rapid Motor Vehicle Company, Pontiac, Mich. He has not made known his plans for the future.

Trade Information Exchange

BUSINESS PROPOSITIONS.

State or Community Representation Is Desired by Manufacturers of Pleasure Cars, Service Wagons, Accessories and Supplies. All of Them Have Opportunities for Live Men Who Seek Advantageous Connections. These Are Well Known and Well Advertised Lines.

In Making Reply to These Propositions Address the Number of the Proposal Only. The Inquiry Will Be Forwarded to the Manufacturer Under That Number and the Reply to the Exchange Will Be Sent to the Inquirer.

761—Territorial agencies open for the sale of a car with a standard chassis, equipped with either touring or runabout bodies, marketed with complete high grade equipment. Price for runabout $1800 f. o. b. at the factory. The cars are guaranteed by the maker as high grade in every detail.

812—Territorial agencies open for sale of a car with two chassis types, the two and four-passenger tourabouts and five and seven-passenger bodies, the second with seven-passenger body; 40 horsepower motors. Cars sold with full equipment. Prices range from $3000 to $4000 f. o. b. at the factory.

793—Agencies open in the Central and Western states for a line of high grade automobile pleasure cars, trucks, municipal service and fire department apparatus, widely known and well advertised, made by one of the best established manufacturers in the industry. Every class of vehicle required for recreation or business purposes is produced and the maker is prepared to afford a character of factory attention that is essential to continued and economical service. The line is very extensive and is especially attractive.

822—Agencies open in especially desirable territory for a line of cars built with two types of chassis, 35 and 40 horsepower, two five and two four-passenger bodies, and roadster. These are sold with excellent equipment throughout, the prices ranging from $1400 to $1700 f. o. b. at the factory. This line is produced by an old and thoroughly reliable firm and is well known.

788—Agents are wanted by a firm manufacturing a standard chassis that is sold with five-passenger touring body for $2000 and for $1850 with a runabout body. The four-cylinder motor is rated at 36 horsepower. The chassis is admirably designed and the equipment is high class in every detail. The body designs are decidedly attractive.

804—Large manufacturer, producing two types of chassis has interesting proposition to those desiring to secure agency for a popular-priced car. One size of chassis is equipped with 26 horsepower (S. A. E. rating) motor, and with two types of runabout and two types of five-passenger bodies; the other chassis is sold with a five-passenger body only. Prices range from $1150 to $1500 f. o. b. at the factory. The cars are all thoroughly equipped.

811—Manufacturer building one of the best known cars in the market is open for proposals from those interested in an agency for a standard machine. One type of chassis is made and this is fitted with roadster, four, five or seven-passenger touring, or limousine or coupe bodies. This line is exceedingly well known and is well advertised. Prices range from $2500 to $2750 for the open bodies, f. o. b. at the factory.

821—A concern building three sizes of power wagon, two tons, 3.5 tons and five tons capacity, desires to establish a number of agents. Built of high class material, to sound engineering principles, with designs thoroughly tested, with a motor of unusual capacity, and with equipment including self-starter, electric lights, and every desirable accessory, these vehicles are especially attractive. The prices range from $2750 to $4400.

772—A desirable connection may be made by a number of agents for a line that includes both electric and gasoline delivery wagons and trucks. The machines are built by a concern of undoubted reliability, with large resources, and the guarantee to the purchasers is very broad. The factory attention given by this company is such as to justify careful inquiry. The range of prices is extremely wide, vehicles being produced for every requirement.

798—Agencies can be established for a high grade service wagon of a ton capacity. But one chassis size is produced. The design is in every way mechanical and the construction and material are unusually substantial. The machine has self-starting equipment. This is an opportunity of distinct merit.

806—The maker of a standard delivery wagon with capacity of 1500 pounds, with open body as standard equipment, selling for $875 f. o. b. at the factory, wishes to establish agents throughout the country. The machines are well constructed, of high grade material, have all desirable equipment, and are sold with a broad guarantee. This is a line that should interest all desiring to secure a popular priced and reliable machine.

779—Agents generally are required by a well established firm producing a 3000-pound capacity delivery wagon that is high grade in every respect. This vehicle has an unusually large number of exclusive features that insure economy of time and attention and make for long endurance. The price for the chassis ranges from $2200 to $2500 f. o. b. at the factory.

799—Energetic agents are desired by a firm producing seven different types of delivery wagons and trucks, these ranging in capacity from 800 pounds to three tons, and in price from $850 to $2900 f. o. b. at the factory. These machines are designed to meet the requirements of all classes of service and are economical and reliable.

918—Manufacturer of two types of delivery wagon, one of 1000 pounds and the other of 1500 pounds capacity, the first with enclosed and the latter with open body, will make attractive contract with live wire representatives. Some excellent New England territory is available. These machines sell for $1000 and $1050 f. o. b. at the factory.

782—New England agent for a manufacturer of high grade moderate priced pleasure cars is desirous of establishing a number of sub-agencies in the section that he controls. He has an especially attractive proposition to make and can give to men who mean business unusual opportunities.

814—The manufacturer of a well known and widely advertised line of automobile oils and greases has an agency contract proposition that is exceedingly liberal to offer to those who want to connect themselves with a reliable and dependable firm. The oils and greases are of grades to meet every requirement and are produced from the highest class crudes by scientific refining.

816—A spark plug manufacturer, producing plugs that have exclusive and desirable qualities, wishes to establish a number of first class agencies. A liberal contract is offered and territorial rights will be given to those who will demonstrate their ability to do business.

819—Agents who desire to secure the selling rights for a spark plug that is high grade in every respect, having construction that insures long service and endurance, can make advantageous connection for both local and state rights. The contract is exceedingly liberal.

794—A well established concern that has the agency for two of the most prosperous industrial states in the East for a line of gasoline and electric service vehicles, produced in sizes and types to meet every possible requirement for transportation, desires to extend its activities to take full advantage of its opportunities. Those who wish to make investment in a business that has unlimited possibilities will find this an opening of unusual promise. It is an especially desirable opportunity for a business man.

801—Company manufacturing high grade pleasure car and service wagon wheels, in New York State, having excess factory space and facilities, will consider proposition to combine with a concern manufacturing automobile parts or completed vehicles. The plant is new, equipped with the latest machinery and ample power, has abundant water from artesian wells and good fire protection. Has four-acre site and a frontage of 856 feet on railroad. The location is a rapidly growing city with the best of freight and express shipment facilities. The proposition is offered with a view to increasing the capital and business of the company. It is open to the closest investigation.

TRUCK SERVICE IN THE PUBLIC GARAGE.

Systematic Attention to Machines Whose Owners Cannot with Economy Maintain Their Own Stations by Methods That Insure Proper Care and Constant Use at a Cost in Every Way Reasonable.

THE business man who maintains his own delivery equipment meets with a serious problem when he considers changing from animal to motor wagons. Experience has demonstrated that it is economical to stable the horses and provide attention as compares with the service of public stables. It is assumed that the ratio of economy increases with the number of animals used. Having knowledge of stabling and care and maintenance expense the inquirer often accepts sometimes without question, a continuation of this system as being imperative to realize the fullest value of the power vehicles. Having experience as owner of a pleasure car and not differentiating clearly that this machine has been used with more or less indifference to expense, and basing conclusions upon suppositions and insufficient information, the prospective purchaser frequently decides that he ought to be independent of all public service to obtain the most practical results.

Form 1, Sufficient Length for Entry of Record of Each Truck Daily—Sent to Office by Foreman.

With the single animal or the team as a unit a delivery may have been developed, but what may appear to be equipment of considerable proportions shrinks decidedly when the motor truck, for instance, takes the place of three two-horse teams. The stable that has been sufficient for 12 horses and six wagons, to illustrate, is seemingly much too large for merely sheltering two trucks. Quarter the barn floor area will suffice to house the machines, and aside from a work bench and small storage facilities nothing else is required. A gasoline storage tank is desirable, but not necessary. To continue the use of the stable as a garage appears to be a waste of money. To change to a smaller seems to be a logical conclusion.

The trucks are not regarded as experiment. They are justified as practical vehicles by the experience of others. It is necessary that they be serviceable during the day and this means that each driver must do a full day's work. Whatever care and attention is desirable ought to be given after working hours or the service of the machines lessens in value. Obviously the trucks should be systematically examined and adjustment or repair made immediately. If the drivers are capable of doing this mechanical work they cannot be expected to work extremely long hours, and if the work is to be principally at night there must be equipment that would not be required were it possible to command the outside facilities available during working hours of the day.

Regarding the condition practically it is realized that there may be many nights, when the care needed should be nothing more than washing, polishing, replenishing the fuel, lubricant and water supplies, oiling and turning the grease cups, filling the lamps and cleaning the engine. Aside from the washing and polishing not more than an hour should be required, and often less time. This attention must be given, however. There will be other occasions when the work may require hours, and sometimes more than one man, because the trucks must be ready for use if it is possible to have them serviceable. Accidents cannot be foretold, but they must be expected and provision should be made to cope with any situation that can reasonably be anticipated.

Obviously it is not economy to have a regular employee capable of doing the high class work essential to insure satisfactory operation of the trucks. He would not have enough to do to keep him occupied. If this service could be combined with another or others to warrant the employment of a skilled man that is another condition. Generally such combination is not possible and the average or usual situation to be met with is regarded. To hire a man for the work stated is an insurance, but it is not economy. To pay a man for the actual labor required would mean paying well for it, because a dependable mechanic could not be expected to devote himself to such employment unless his price were paid.

Then the condition is, that the man whose delivery service is such that he can not afford a well equipped private garage to maintain it must either sacrifice some of the economy he seeks until it has increased to such proportion as will warrant every facility, a development that must necessarily be slow and dependent to a considerable extent upon the satisfaction he gives to his patrons.

    Knock in motor

Form 2, of Size to Meet Requirements—Sent to Office by Foreman.

The alternative is to turn to the public service stations, which are generally devoted to pleasure vehicles, and with these the methods usually the vogue are not conducive to the character of service a business man must have. There are stations where admirable attention is given, but what is stated applies generally and not specifically to all. Under ordinary circumstances the mechanical force is employed during the day, and night work is an accommodation. Overtime must be paid for at regular rates. The night workers are cleaners as a rule and few stations pretend to afford the same character of service day and night. In such stations, too, the drivers do not have access to the machine and tool facilities and the stock, for these are never left accessible to those not responsible. The lock and key are surprising preventions of leakage and loss.

SUGGESTIONS TO OWNER.

Date ....

O'Neill & Mulligan
Truck No. 5—
Brakes relined (necessary)
Cylinders cleaned
Valves ground
Repair left rear tire (necessary)
Probable time required

Form 3, Small Sheet, Padded, in Two Colors of Paper—Original Sent to Owner and Copy to Office for Record.

Contrasting the private and the public garage the rental of the one must be as against the price paid for storage. The washing, polishing, protection and the working facilities for the driver in the station are included in the cost, and the last mentioned offsets the expense for some equipment. The difference in cost of gasoline, oil, grease, waste, and similar supplies eventually eats up the initial cost of a storage tank and fittings. There must be a profit for the station, but the real concern with the truck owner is not that profit, but his own, to insure which he must keep his machines as continuously in operation as is possible.

The rapidly increasing utilization of the motor wagon has brought the business man to require of the public garage a character and quality of service not previously demanded, and the garage manager faces a problem that is quite as perplexing as that the truck owner is contemplating. It is apparent that this condition must be met and that it must be purely on a basis of business merit. No other factors are worthy of attention. The principal business of many garages will eventually be with service wagons and this being so the earlier this foundation is reached the better. It is possible for the garage to afford to owners of wagons who desire service a better attention than they could secure in their own stations, and at a cost that is sufficiently economical to satisfy them under all conditions.

The example of service is that given by the Central Garage, Pawtucket, R. I., conducted by Fred H. L. James. Mr. James is a draftsman by profession who advanced to the management of a large and extremely high class machine works, and has an experience that has been especially valuable to him. His health required him to abandon work for several years and he engaged in his present business because it was convenient to his home and permitted him to be out of doors the greater part of his time.

Mr. James' knowledge of business methods and men was such that he met conditions as they arose with entire success, and he has developed in connection with his garage a service that is in every way practical, economical to his patrons and sufficiently profitable to justify this class of custom quite as much as any other. For the benefit of those who may seek to profit by the suggestions of this article it should be stated that the prices charged at the garage are average. When Mr. James took over the business there were numerous losses and leaks that were sought and remedied. This was a condition that might obtain with any man. Eventually a system was adopted that has proven extremely satisfactory in every respect. Emphasis is made of system because suggestions are made that may be employed to good advantage in following the general idea of a service for motor wagons, and it is imperative with any business to have record of every transaction in the simplest and most practical form. It should be said that these are not the forms used by the Central Garage, but are what appears to be desirable with any volume of business of this nature.

It may be well to state that at times the combination service causes conditions that are unavoidable where the two classes of vehicles are in storage, particularly Sundays when rain falls and it is necessary to work on the trucks, for they take up much floor space and with cars constantly going and returning there is necessarily congestion. It is not possible to interfere with the work on the trucks and it cannot be slighted, so that to obtain the most practical results a systematic arrangement of the cars in the garage is first of all to be decided on. Other days the trucks are worked during business hours and it is seldom that more than one at a time is receiving attention, so that space is not so greatly needed.

The service referred to was started with a single truck and it has been so well conducted that now five firms having one and two trucks avail themselves of it rather than establish their own garages. The prospects are that this will be largely developed the present season. It is probable that this will lead to a separate station, wholly for the trucks and wagons.

The attention given is of two classes. The one is a standing order for such work as is necessary to maintain the trucks in a thoroughly serviceable condition. The other is where work is authorized by the firms upon notification of conditions. The expectation is that the machines will be ready for work each morning and this requirement must be met. In several instances this has meant work the entire night for some of the men, but in only two instances has there been failure; once when an engine case was damaged beyond any form of repair save welding, and another time when a shaft was not delivered as ordered. Taking four years' service this is a thoroughly businesslike showing.

The service first covers storage during the time the trucks are not in use, daily washing and polishing, oiling and tightening the grease cups, filling and cleaning the lamps, cleaning the engine, and replenishing the fuel, water and lubricant. The care is for a regular monthly charge. The supplies are charged in the quantities used. The most important thing is the attention to the mechanical condition of the trucks.

3 Sent to maker, Fedders Company, Buffalo, N. Y.

Form 4, Small Sheet, Padded, in Two Colors of Paper—Original Sent to Owner and Copy to Office.

The foundation of this is the reports made by the drivers, who are required to report to the foreman or the office any trouble experienced or condition noted during the work of the day. When the trucks are driven into the garage the engines are operated within the hearing and observation of the foreman or Mr. James, and usually any derangement or fault may be detected. If there are in the reports any evidences of needs of adjustments, breakages, or damage or wear, these are inquired into immediately and necessary work is begun at once.

Experience has proven that it is well to take all the time available, because of possibilities of other developments, and as the mechanical force is limited no chances can be taken. Where a work can be completed it is taken care of, but in some instances a temporary repair is made until restoration of a permanent nature or replacement is practical. There are times when the tightening of a bolt or the adjustment of a part will mean the saving of many dollars and nothing needed is left undone, but as a rule the work each night is not such as to require much time. Because this care is taken daily there is but little to anticipate aside from actual breakage.

But each Sunday the trucks are systematically inspected and gone over. The engine is run to determine its condition, the radiating, ignition and lubricating systems are examined, the clutch is tested, the transmission cover is removed and the gears tried by feeling, the chains are loosened and the jackshaft, its bearings and differential are operated by hand to detect lost motion or wear, the brakes are operated and the connections gone over. Next the wheels are jacked and the condition of the bearings learned by testing with a pinch bar, and the steering gear and the lever arm, tiebar, knuckles and pivots are examined carefully. The radius rods and chains are looked over and the springs are seen to. The work is thorough and the men tighten every bolt that is slack, make such adjustments as are needed, and test the trucks on a short but steep hill. The workmen are expert in the inspections and the trucks are left ready for the work of the week to come. The charge for work is for the labor, plus the cost of any parts or material used.

It is a rule that no work shall be regarded as completed unless it has been tested, and nothing is taken for granted. This means that when the trucks are worked on at night they are tried out so that they will be in condition to use when the drivers call for them in the morning. The result of this service is that the trucks are always available and there is practically no time lost except when withdrawn for painting or

Form 6, Signed by Garage Manager in Duplicate, Original to Owner, Copy to Office.

perhaps an overhaul. The real economy is in having them always serviceable.

The garage equipment must be equal to all demands made upon it. This does not mean unprofitable machine tools, but in special fittings that will make possible work out of the ordinary requirements. There should be at least one first class lathe with the regular and the special gears that will be useful in milling, for instance, thread cutting, and the like; a drill press is very useful, and other tools may be utilized to good advantage. A power air compressor is absolutely needed for the forge and brazing outfit. There should be a complete forge and the tools for working it, and the hand tools should be such that there will be enough for every worker. The stock of material should include bar nickel steel for shafts, steel tube for axle housings, bar steel to five inches diameter for gear blanks, as well as the usual rod, bar and sheet metal necessary in repair work.

The workmen should be the best that can be secured and one of them ought to be a first class blacksmith, capable of doing any work. One of the faults with most garages is that they have the forges and no men who can do the work required. To illustrate, in the event of a gear being needed and the maker a long distance away it is possible to forge a steel blank and have it cut outside, for few stations have milling or gear cutting machines. A broken front axle may be plated and brazed for a temporary or even a permanent repair, and fractured rods and parts welded or hand forged. A good blacksmith can fit the work he is making and minimize the other labor upon it. The better the machine men understand the value of their tools the more satisfactory the results. A broken axle shaft can be replaced, even to milling the square ends and cutting the threads, on an ordinary lathe. No end of work can be accomplished with the lathe, which is the most useful of tools.

The resourcefulness of the garage manager is a large asset in business. To meet an emergency and deliver the trucks on time is what brings him patronage and retains his customers. Only in the event of impossibilities should he fail, and then he must give sufficient notification to the firms dependent upon him to permit arrangements to be made for the delivery to continue. A broken engine case of aluminum cannot be welded with ordinary garage facilities and a repair is not even guaranteed by those who specialize repairing. It must be sent to the specialist or the maker or replaced. Such an accident means unavoidable delay provided the engine cannot be replaced by another.

Where the truck is built a long distance from the owner it is well for the buyer to have on hand such parts as might be needed at any time. If there is an agent within a reasonable distance he may be depended upon for replacements, but there may be some delay in securing them in the event of emergency. If the maker has a branch, or if the factory is near at hand the need of parts need not be apprehended. The garage, however, cannot be expected to carry parts unless it is agent. In considering service it is well to understand the possibilities in the event of necessary restoration and to make the provision that appears wise to do. This is a matter that the owner, and not the service station manager, has to deal with.

For the benefit of those who might desire to adapt their service to trucks a series of forms has been prepared which are practically self-explanatory. The first is the day report, which conforms to law in many states as to the registration of vehicles leaving and entering a garage, together with the odometer reading, the quantity of gasoline, oil and grease supplied for replenishment. The second is the report of the foreman which notes the conditions reported by the drivers.

The third is a statement of necessary and desirable repairs to be sent to the owners as official notification, this establishing a responsibility for any condition that might arise for failure to authorize the work needed. The fourth is the statement of outside work sent away, to establish any cause for delay or failure when returned, and that the charges were legitimate. The fifth is a weekly inspection and work record, which indicates that all parts of the machine received attention and that adjustment, repair or replacement was made, with the time for the work, together with such supplies as were necessary and a reading of the odometer to show the work of the truck during the week. The sixth is a monthly report to accompany the bill, which gives the hours of service for the month, the mileage, the fuel, oil and grease used, the supplies furnished, the parts required, the charges for labor other than regular attention, with a summary of the condition of the truck and suggestions as to work needed or desirable.

It will be understood that the value of the weekly report is to show that the truck was systematically examined and the proper care given. The monthly report details the cost of operation aside from the service charge, which, with the other detail available, gives the owner an accurate account of the expense of operation. As it is for the interest of the station to keep the expense within reasonable limits, and as the owner desires economy, the reports are equally valuable.

REMOVING SHACKLE BOLTS.

Sometimes, when dismantling the chassis the shackle bolts refuse to yield to the usual methods. Where they prove stubborn the operation will be facilitated by jacking up the spring to relieve the tension. The bolt then should be turned with a wrench, while being driven out. These parts are subject to wear, and when shoulders are formed, should be replaced with new ones. It is these ridges that cause the trouble.

ADJUSTING TENSION RODS.

It is attention to the little details of the car that pleases the owner and creates a satisfied customer. A few minutes spent looking over the chassis for loose nuts, bolts, etc., is time well expended. Among the parts which should receive attention occasionally is the tension rod of the rear axle. When this member becomes loose it usually will be found that one of the nuts at either end is at fault and it may be possible that the rod itself is spoiled.

The object of the device is to keep the rear axle from sagging and a majority require this support. The rear system could be such as to omit the member but this would mean extremely heavy construction. A design employing the rod is more nearly correct scientifically than without, as it can be made lighter and equally as strong.

The best method of adjusting these is to jack up the wheels so that the weight is nearly off the tires. The adjusting nuts are then screwed up, not too hard, but just snug, for if the tension be greater than this it puts a needless strain upon the axle, and not only sets up internal friction, but may result in the rod breaking again before long.

MAGNETOS FOR GAS ENGINE SERVICE.*

Principles Involved in the Design of Standard Instruments, Features of Construction and Conditions Essential to Efficient and Continued Operation of This Generally Adopted Source of Electric Energy.

(Continued from March Issue.)

Wiring of Bosch Dual System.

The connections of the Bosch dual system are shown at Fig. 26, the coil being displayed both in elevation and end views to show the terminal block. The grounding terminal of the magneto is run to the grounding terminal of the switch and when the ignition is switched off or when the engine is utilizing battery current terminal 2 is grounded. With the switch thrown to battery position the flow of current is from the positive terminal 7 of the chemical current producer to the ground, thence by the battery timer lever to the battery connection on the magneto, to switch terminal 1, through the primary winding of the induction coil to 5 and thence back to battery.

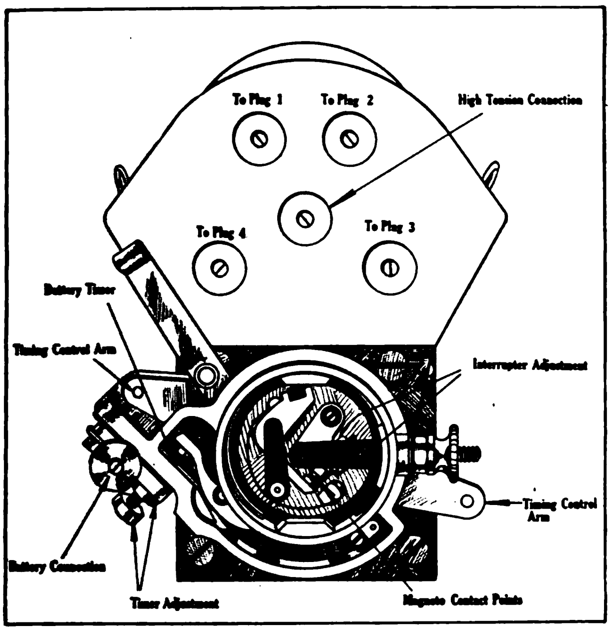

Fig. 25—Bosch DU4 Dual Magneto Contact Breaker Arrangement.

The secondary terminal of the magneto is coupled to switch terminal 3 and the high-tension distributor connection 4 is attached to contact 4 of the terminal block. When the switch is thrown to the magneto position the high-tension current produced in the magneto armature winding flows by wire 3 to switch and back by wire 4 to the distributor, by which it is delivered to the plugs. When operating on the battery the magneto is grounded and there is no production of secondary current. The switch is in such position, however, that the secondary current from the transformer coil is supplied the distributor.

The dual system permits one to operate the engine on either battery or magneto, either furnishing satisfactory ignition, this being done by making the battery and magneto systems distinct electrically, though they are combined for the main part in the magneto. This is not required by all motor car manufacturers, and the duplex system has been devised to provide a battery for self-starting or starting readily at very low cranking speeds, at the same time permitting running of the engine mainly on the magneto. The word "duplex" was selected as a title for this system because two distinct currents make simultaneous use of the same circuit.

The duplex magneto differs from the standard DU4 type in the provision of two binding posts on the cover of the interrupter housing. In the illustration, Fig. 27, it will be seen that two metal segments are placed on the inside surface of this cover, one being connected to each binding post. The method of wiring requires the positive terminal of the battery to be coupled to one of these binding posts and the negative to the other.

To understand the action of this commutator, we will take the instant when the carbon brush "B" is in contact with the segment to which the positive terminal of the battery is connected and it will be seen that the battery current flows to the carbon brush "B," through the interrupter points and back through carbon brush "A" to the negative of the battery. When the interrupter is closed it forms a path across the segments and the breaking of this short circuit by the opening of the interrupter points results in the production of extra current in the primary coil. The direction in which the extra current will flow will be the same as that of the magneto current and it will supplement and intensify it. A half revolution later, the other segment will be in contact with carbon brush "B" and the conditions will be such that the flow of battery current will be reversed to coincide with the reversal of magneto energy. With the battery properly connected every alternation of magneto current is accompanied by a reversal of the battery circuit. The wiring diagram Fig. 28 clearly shows the arrangement of parts. The coil is provided with a button, which is depressed to start the engine without cranking. One of the peculiarities of the duplex system is that the battery and magneto are connected in parallel and not in series, as obtains with the usual transformer coil system.

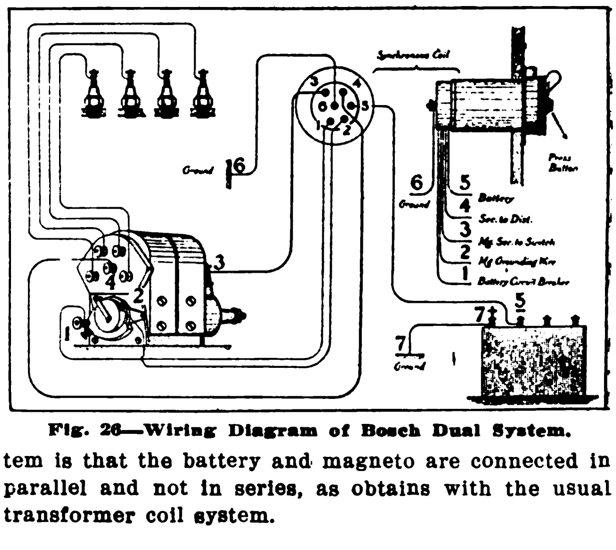

Fig. 26—Wiring Diagram of Bosch Dual System.

---

*This article, which is descriptive of a number of the best known magnetos to be found in the market, and which are standard with motorists, is reproduced from the "A B C of Magneto Ignition Systems," one of the series of Standard Handbooks of Automobile Mechanics published by The Automobile Journal Publishing Company.

It should be understood that the use of the interrupter to make and break the battery circuit does not in the least interfere with its function of opening and closing the magneto circuit as the two are practically distinct with the exception of the interrupter points. When these are together the low-tension magneto current can flow freely in one circuit and the battery energy flows with equal freedom in the other.

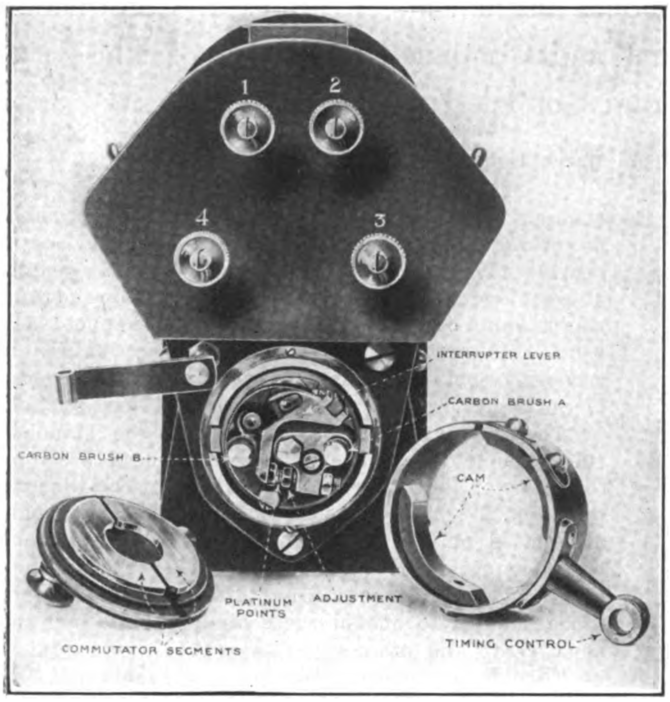

Fig. 27—Bosch DU4 Duplex Magneto, Showing Contact Breaker Construction.

The extra current produced in the primary coil by the separation of the contact points discharges through the primary winding of the armature and its action is to supplement the current already existing there. The final effect is to build up the magneto current by the addition of that derived from the battery and the spark produced in the secondary circuit will have more than ordinary intensity. By utilizing the secondary winding of the magneto in this manner, and obtaining a strong current from an external source, one will obtain a hot high-tension spark at the lowest speed at which the engine may be cranked. The reason for this is that one is not dependent upon the current produced in the magneto armature, which is of less strength when the shaft is revolved slowly, as the electrical energy is produced from an outside source.

In addition to the systems already enumerated, the Bosch magneto of the independent type may be used in connection with a double system; that is, by the addition of a timer and distributor for the battery current and a transformer coil of the vibrator type, one can fit two separate sets of plugs, one to work directly from the magneto distributor, the other supplied by the synchronous coil through the secondary distributor driven from the engine.

The vibrator is only used for starting on the spark, the battery circuit breaker being of the quick contact type, producing a single impulse in the primary of the coil, and a corresponding single spark at the plugs for normal running. For starting on the switch, however, the starting button is depressed, the vibrator causes a constant stream of sparks to flow between the plug points as long as the depression continues and the distributor brush of the secondary timer is in contact with one of the segments leading to a spark plug. If there is any gas in the cylinders, it will be exploded and the engine will take up its cycle of operations without preliminary hand cranking. The wiring diagram of such a system is clearly shown at Fig. 29.

Features of Unconventional Mea Magneto.

The Mea magneto is a distinctive type recently introduced in this country and while it operates on the magneto-electric induction principle, it differs very much in form from the conventional types considered. As will be evident from Fig. 30, which gives a longitudinal section and end elevation, with all principal parts outlined, the magnets are radically different from the usual horseshoe type used in instruments of this character to produce the magnetic field. The magnets are in the shape of a bell and the armature is mounted between the pole pieces in such manner that its axis of rotation coincides with the central longitudinal axis of the compound bell shaped field magnet encircling the armature.

With the horseshoe types of magnetos, the timing of the ignition is effected by breaking the circuit between the contact points earlier or later relative to the direction of armature rotation, and the magnets remain stationary. With a retarded spark lever placing the circuit is not broken at the time of maximum current strength in the armature and consequently, the spark is weak unless the spark lever is advanced, so that the break between the points will occur simultaneous with the position of the armature that coincides with the greatest current strength.

It is claimed that the construction of the Mea magneto allows one to obtain as hot a spark on the fully retarded position of the timing lever as in full advance. In this construction the bell shaped magnet casing is mounted on special bearings, and the ignition timing is changed by rocking the outer casing on magnets. As the magnetic field is moved to correspond to the time of breaking contact between the points, the separation takes place at all times when the armature is at the most favorable position and the spark takes place when the voltage produced in the armature is at its highest value.

The contact breaker and distributor are also novel in construction. The former is placed parallel to the primary winding outside of the magnet in a small housing, and the short circuiting and breaking of the primary current takes place between a pair of platinum screws, one being fixed to a disc, the other on an annular steel spring. The points are separated by a fibre roller at the proper time.

The distributor employs two revolving brushes instead of one, these being imbedded in a block of insulating material driven by the usual reduction gear, and as the brushes are placed 90 degrees from each

other, obviously, each makes contact with two segments in the distributor housing which are connected to the spark plugs. Advanced ignition is obtained by rocking the apparatus in an opposite direction to that of armature rotation, a retarded spark is secured by oscillating the case in the same direction as the armature turns.

Volta Magneto Has Desirable Features.

The Volta magneto, shown at Fig. 31, belongs to the arc-flame type, generating the high-tension current in the armature without the aid of an external coil. The field magnets, armature, interrupter and distributor follow standard design. It has a number of desirable features, however, among which are the ability to adjust the contact points without stopping the engine, instant accessibility of the condenser and a very simple distributor arrangement.

A study of the illustration will show how the above results are accomplished. The most noticeable feature is the location of the condenser. Instead of being mounted on the armature shaft behind the interrupter, it is separately contained in a water tight box, held by one screw and a pin where it may be withdrawn in a moment and replaced by a new one, should that be necessary. The cover plate over the armature is permanently sealed, and the armature is therefore enclosed water tight.

Removing the condenser from behind the interrupter, as in conventional designs, permits one to place the high-tension collector ring directly under the hard rubber distributor housing. The high-tension current therefore goes directly up by the carbon collector brushes to the distributor. The housing fits the casing beneath it so closely as to prevent water from entering.

The armature shaft runs in ball bearings of unusual size, and these bearings are separated by partitions from the rest of the mechanism. The oil cups deliver oil to the bearings, and drain outlets are provided underneath. Even that provision, however, would not be sufficient to prevent trouble from over lubrication except for the partitions mentioned.

The interrupter, which is shown with the cover plate removed, differs from some other interrupters in that the cam itself rotates while the "breaker box" as a whole remains stationary. The cam is of hardened steel and runs against a steel roller. The contact screw is stationary, and may be adjusted while the engine runs. The course of the primary current is through a central insulated wire passing through the armature shaft to the insulated button bearing against the flat spring on the insulated mounting, thence from the contact arm to the grounded contact point. One of the binding posts is connected to the condenser and the other connects with the ground switch.

The distributor differs from some others in that the hard rubber housing has no high-tension contact segments. Instead, the rotating hard rubber disc has a single T shaped inlaid brass segment receiving current from the carbon distributor brush. The cross bar of this segment travels around, making contact one at a time with as many carbon distributing brushes as there are cylinders. These brushes take the place of the usual stationary segments, and the brass segment takes the place of the usual distributing brush. The effect is to increase considerably the insulating distance from one collector brush to the next, since the brushes are much smaller than the usual segments. In this way arcing from one segment to the next is avoided.

The armature diameter of the Volta magneto is said to be somewhat larger than the others, and the secondary winding has about 600 more turns. This results in a hot spark at ordinary cranking speeds. The clearance between armature and pole pieces is as small as accurate workmanship and due allowance for expansion from heat will permit. After being completely assembled the armature is brought to final size by grinding. As the section shows, the distributor runs in ball bearings, and it will continue true

for an almost indefinite period of operation.

Details of Eisemann High-Tension Magneto.

In common with other instruments working on the same general principles, the Eisemann direct high-tension magneto has a double wound armature, revolved in the magnetic field produced by three pairs of U magnets. As in other high-tension types the armature is revolved by outside gearing and during its rotation the low-tension current is produced in the primary winding twice in one revolution and the secondary current is induced in the finer coils simultaneously with the breaking of the primary short circuit by the separation of the contact points.

The general details of construction of the magneto and the relation of the various parts of the mechanism are clearly shown in the longitudinal section at Fig. 32, while the arrangement of the contact breaker and distributor parts is depicted in the end view on the same plate.

The make and break or interrupter mechanism moves inside the fixed cover carrying the cams and it is fastened to the armature axle by an easily removed screw, and if this fastening is extracted the entire make and break assembly can be removed. The cover carrying the cams is oscillated back and forth to alter the timing, suitable timing levers projecting on both sides. Immediately back of the contact breaker one can see the annular ball bearing employed to support the front of the armature. The distributor driving gear is placed back of the bearing, and the condenser is carried near the armature being concentric with the armature shaft and turning with it.

(To Be Continued.)

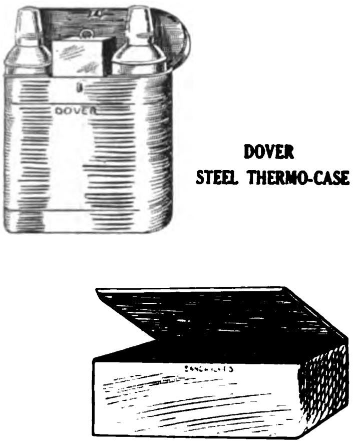
ACCESSORIES AND APPLIANCES THAT SELL.

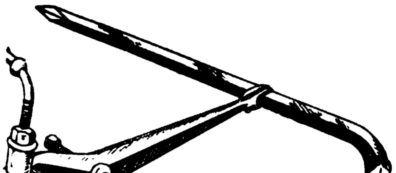
The Dover Steel Thermos Case is a novelty manufactured and marketed by the Dover Stamping & Manufacturing Company, Cambridge, Mass. The Thermos bottle is an accessory that is appreciated by motorists as the vacuum will keep fluid hot or cold for hours and is adaptable to all temperatures. As these members are fragile and broken easily when not handled properly, they should be carried in some form of protector. The Dover case is constructed of steel and so arranged that two bottles may be carried, also a sandwich case. The interior of the container is lined with double faced corrugated heavy cardboard and forms an absolute protector against shocks. The cases are enamelled black with two narrow gold stripes and present an attractive appearance. They are inexpensive, occupy but little room and are very light.



DOVER STEEL THERMO-CASE

* * *

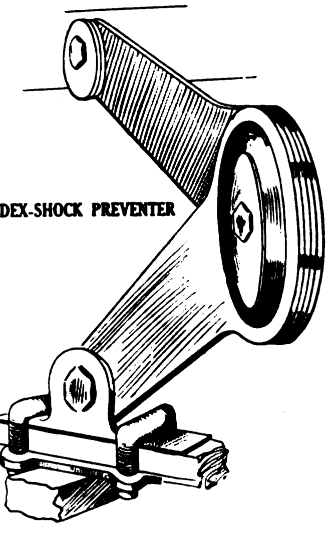
The Sager Diamond Bumper, manufactured by the J. H. Sager Company, Rochester, N. Y., is a new form brought out by this concern and its features should appeal to the discriminating motorist who desires something distinctive. The advantages of these devices are many. Drivers sometimes carelessly back into other machines before the latter may be reversed, and in shifting the positions of cars in the garage headlights are broken and considerable damage may result. The new Sager device has a diamond-shaped bar which adds to its appearance and is constructed of heavy, solid, hardened brass, reinforced with thick open hearth steel, making the tube almost indestructible. The bell cranks are of solid manganese bronze. It is attached easily and when fitted stands six inches above the spring hanger, thereby protecting lamps, radiator, fender and tires. Where an automobile is being operated in heavy traffic it is a valuable equipment.



SAGER DIAMOND BUMPER

* * *

The Mondex Shock Preventer, marketed by the Aristos Company, New York City, is said to differ in principle from other devices for the purpose of softening the concussion of road shocks. Vibration causes considerable trouble and the maker of the Mondex claims it will reduce to a minimum the liability of broken springs as well as improve the riding qualities of an automobile. It is placed between the axle and frame of the car, and controls the action of the spring as it moves up or down. The principle is not friction, but a graduated compression of expanding and contracting resilient rubber discs, and it is said that the rubber cushion rapidly increases in resistance the further it is compressed, so that a heavy shock meets with much and a light one with but little. The difference between the downward motion and the upward or recoil of the spring is met by having a greater amount of rubber compression on the rising movement. This is brought about by the different grades in incline of the planes.



MONDEX-SHOCK PREVENTER

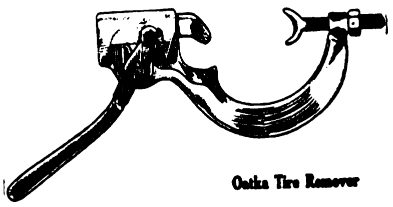
The Oatka Tire Remover is a neat, compact tool, designed for use on quick detachable rims. With it the removable flange may be forced back easily and the device locks automatically so that the lock ring may be displaced from its groove. Applied between the spokes of a wheel it may be utilized to remove the most stubborn shoe. The tool is reversible in its application and is made in two sizes. It is marketed by J. W. Grumiaux, Le Roy, N. Y.

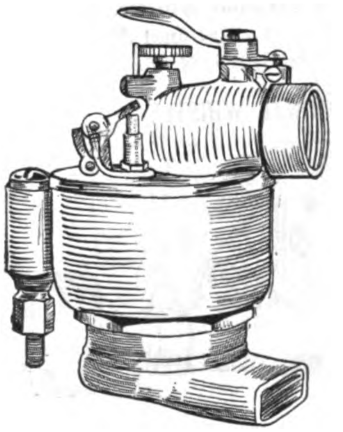


Oatka Tire Remover

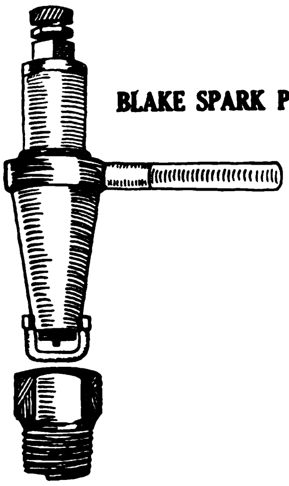
* * *

Planhard Carburetors make for simplicity, inasmuch as they are free from springs, and have but one spraying nozzle, this being located in the centre of a cup shaped member and surrounded by a constant air opening. At low and intermediate speeds air is admitted through these openings, but upon the speed of the piston increasing, its suction lifts one or more balls in a plate surrounding the fixed air passages, increasing the amount of air admitted. This plate is adjustable and is fitted with six balls. A concentric float is utilized, enclosing the upper fixed air passage. This is controlled in the usual manner and equipped with a priming device. The needle valve proper is adjusted underneath and locked by a wing nut. It is claimed of the Planhard carburetor that a perfect mixture is obtainable and that economy of fuel is effected. It is made by the Planhard Manufacturing Company, Kokomo, Ind., with general sales offices located at Philadelphia, Penn.

PLANHARD CARBURETOR



The Blake Q. D. Spark Plug, produced by the Blake Spark Plug Company, Cambridge, Mass., presents interesting features, inasmuch as it may be quickly disassembled without the use of a wrench or other tools. Integral with the mica or porcelain member is a handle and by giving this a quarter-turn the plug is unlocked and removed easily, leaving the threaded part in the cylinder. The recess into which fits the metal member carrying electrode is tapered and a cam guide-like device forces the two parts together making the plug gas tight, and at the same time locking them securely. The handle is covered with wood, thereby preventing shocks when the plug is removed for testing the spark or cleaning the points. It is claimed of the device that these never have to be adjusted. It is of special value on cars not equipped with a priming cup as by the removal of the electrode member gasoline may be inserted in the cylinder without detaching the wire.

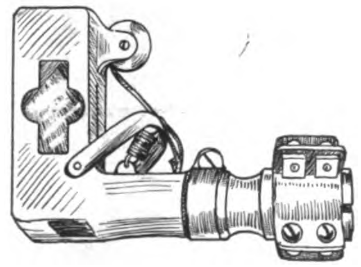


BLAKE SPARK PLUG

★

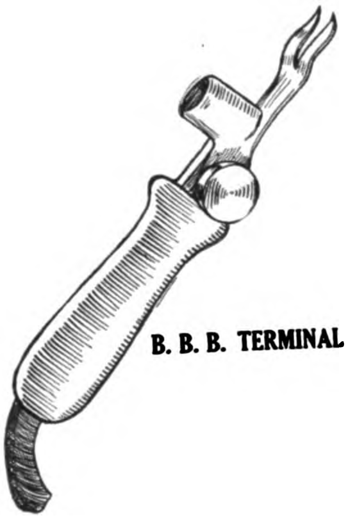
The National Whistle, manufactured by the National Signal Company, Brooklyn, N. Y., is attached to the exhaust pipe of the muffler and is operated by the pressure of the burnt gases. It is constructed of aluminum, trysquare in shape, and is said to be carbon proof and productive of a rich, mellow tone, yet of sufficient strength to be audible over traffic noises. It is fitted with a movable valve which in normal position closes the sound chamber allowing the gases to flow directly out into the open air. When the valve is moved forward by a cable actuated by a pedal, it almost closes the exhaust passage, leaving a small opening through which the gases are forced in a thin air current, these breaking against a sharp edge of the valve and being deflected into the whistle.

NATIONAL WHISTLE



★

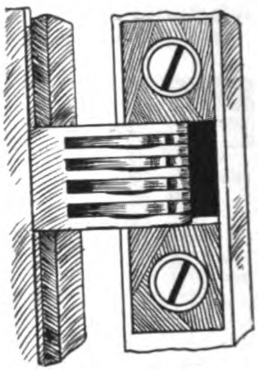
The B. B. B. Spark Plug Terminal will appeal to motorists who have experienced the unpleasantness of a shock when testing out a faulty spark plug. It is a combination device inasmuch as it serves as a regular terminal and provides means for proving the action of the spark when the plug is removed and laid upon the cylinder. The terminal is substantially constructed of metal, nickel plated, and may be attached to any type of plug. An enameled wooden handle is fitted to the terminal and is so constructed that the secondary wire may be inserted and locked securely. Being of wood, a non-conductor of electricity, shocks are prevented. The device is made in one size adaptable to any plug, manufactured by the B. B. B. Combination Terminal Company, Dorchester, Mass.



B. B. B. TERMINAL

★

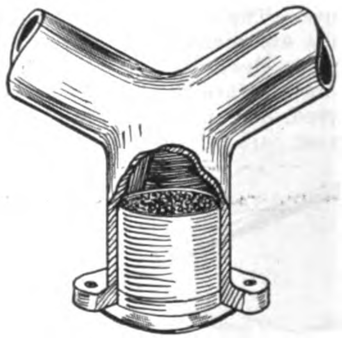
Soss Invisible Hinges are produced by the Soss Manufacturing Company, Brooklyn, N. Y., and are designed for motor cars, although applicable to any type of door. When fitted they hold the door rigid, but provide a perfectly smooth action. They are constructed of a frictionless metal connected by links and are especially adapted where the body of a vehicle is curved. A feature emphasized is that they require less thickness of wood in the post or body, as the width of the plates is 1.125 inches, allowing them to be mounted in a post 1.25 inches wide, and at the same time provide for a throw of one inch. The hinges are made with a separation of .125 inch between the plates and it is claimed they will withstand rough usage. They are finished in black, oxidized copper, bronze, etc. The installation is simple, requiring only screws and washers.



SOSS INVISIBLE HINGE

★

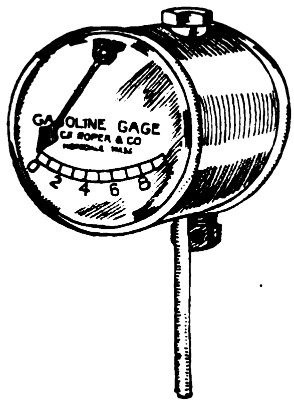
The Crone Vaporizer is a device which may be inserted in the intake manifold of a hydrocarbon motor without alteration to the piping and which does not interfere in any way with making the regular connections mixture tight. The construction is of metal, one end having a lip or extension for fastening it securely. A fitting of corrugated mesh breaks up any raw gasoline that is drawn from carburetor and converts the fluid into a perfect and dry mixture. Being constructed in tubular form it provides a vaporizing surface, according to size, from 150 to 1000 square inches. Back pressure is absent and the mesh will not



CRONE VAPORIZER

clog or get out of order. It is claimed that with the vaporizer, faulty action of carburetors is regulated and that a considerable saving of gasoline is effected. Carbon caused by too much fuel is prevented as well as danger of a backfire to the carburetor. It also is held that overheating of the motor is eliminated, inasmuch as the device provides a dry mixture. It is manufactured by F. G. Crone, Buffalo, N. Y.

ROPER GASOLINE GAUGE

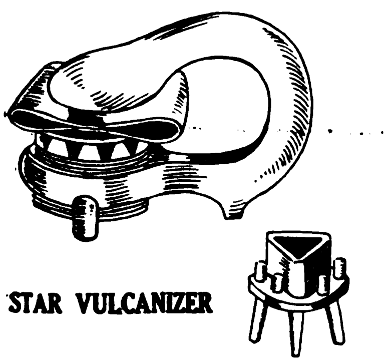


—— ★ ——

The Roper Gasoline Gauge is a device for indicating the amount of fuel in the tank. It is fitted to the dash and does not detract from its appearance, being not unlike a speedometer in design. The dial is calibrated in inches and a movable hand indicates the amount of fluid in the tank, whether the car is on the level or a grade. There being no complicated mechanism, there is nothing to get out of order. The gauge is enclosed in a polished brass case, has an enamelled dial and a beveled glass face. It is connected to the fuel tank by a .25-inch copper pipe and is installed easily without special fittings. It is manufactured and marketed by C. F. Roper & Co., Hopedale, Mass.

—— ★ ——

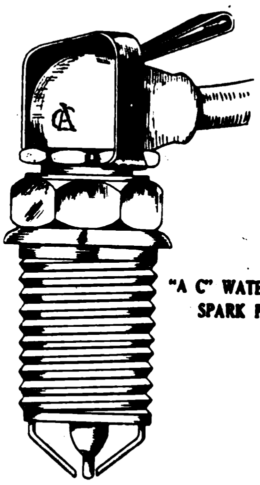
Star Self-Regulating Vulcanizers, manufactured and marketed by the Star Rubber Company, New York City, are designed especially for the motorist who makes his own repairs to inner tubes. They are compact and put up in a strong, nicely finished hinged box adapted for carrying in the car. Being constructed of solid aluminum, they are very light. In practise the tube is clamped between the plates and one of the triangular heat units lighted. These give off the proper heat and the device does not require any watching or adjusting, the temperature being regulated automatically. The heat units come in boxes of 10 and are inexpensive. The equipment includes material for vulcanizing, etc.



STAR VULCANIZER

—— ★ ——

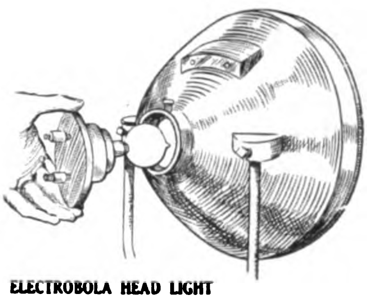
The AC Waterproof Spark Plug being marketed by the Champion Ignition Company, Flint, Mich., is rather unique in construction, as the waterproof feature is obtained by the design of the plug itself, instead of by extra fittings. Attached to the centre electrode is a vertical coiled spring which passes through a recess in the porcelain hood. The latter has a short sleeve inside the plug, and is held in position by a spring clip. The opening through which the secondary cable passes into the hood to the electrode is horizontal, fitted with a tube about .75 inch long, and threaded for the purpose of screwing in the cable securely. This arrangement prevents water short circuiting the member. An advantage of the new device lies in that after the hood is removed, as it may be detached when the plug is taken from the cylinder, there is no exposed insulation to be broken by careless handling.



"A C" WATERPROOF SPARK PLUG

—— ★ ——

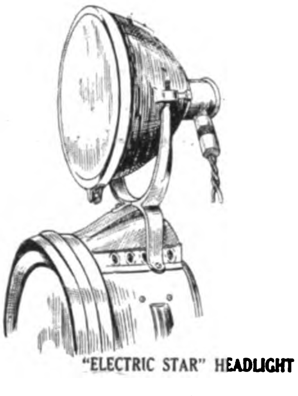
Electrobola Headlights are manufactured by the Electrobola Lamp Company of Milwaukee, Wis., from one piece of aluminum casting which is machined carefully and presents an unusually highly polished interior. The device is dust as well as moisture proof, as its design is such that any replacement of bulbs does not require the opening of the front, this part being fastened securely. An Edi-Swan socket for bulb and outside connection is utilized and this arrangement permits of easy removal of the member for inspection. The leads are attached to two terminals on the outside and by disconnecting the wires the part may be removed as a whole. It is held in position by a locking screw. It is claimed that the lamp will furnish a bright, white light which will cover the road fully.



ELECTROBOLA HEAD LIGHT

—— ★ ——

The Electric Star Combination Headlight is an auxiliary lamp that should interest motorists who reside in the suburbs not lighted, as by merely pressing a button the device will illuminate the road for a considerable distance. Under the usual conditions the driver upon reaching the city limits is obliged to stop his machine and light the acetylene members in order to traverse a short distance over an unlighted highway. In stormy weather this is a disagreeable task. The Electric Star lamp is fitted with brackets and may be placed on the regular gas lamp easily. The brackets are constructed with a three point suspension, insuring rigidity and eliminating any possibility of their vibrating loose. They are operated by an electric battery and equipped with the Edi-Swan candelabra bayonet socket, which by turning to the left loosens a screw permitting an easy removal of the member and bulb. The

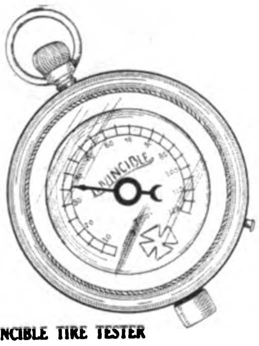


"ELECTRIC STAR" HEADLIGHT

lamps have a large roll rim which adds to their appearance. They are marketed by the Milwaukee Bronze Casting Company, Milwaukee, Wis.

* * *

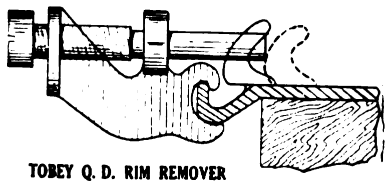
The Invincible Tire Tester is designed for the purpose of ascertaining the amount of pressure in a pneumatic shoe, is similar in appearance to a watch, and is equipped with ringed handle. The dial is graduated and will register a pressure of 120 pounds and a feature of the scale is that the size of tires is marked above the figures so that the operator does not require a knowledge of the amount needed for proper inflation. The instrument is attached in the usual manner and the recording hand remains stationary until released by a button, a feature that will appeal to motorists who are obliged to inflate a shoe in the dark. It is marketed by the Penn Auto Supply Company, Philadelphia.



INVINCIBLE TIRE TESTER

* * *

The Tobey Q. D. Rim Remover is a device manufactured and marketed by William L. Tobey, Boston, Mass., and is designed for the purpose of making easy the removal and replacement of the rims utilized on Universal or Firestone quick detachable tires. It is inserted at the joint of the locking ring of these members and by turning the screw attachment, when the clamp nut is removed from the valve stem and the latter forced up from the rim, the clincher ring is moved away from position indicated in the full lines over the locking member, to the dotted lines so that the ring may be removed easily. The usual practise is to employ a screw driver or chisel, or tools in the regular equipment. In replacing a tire, the inner tube may be inflated enough to prevent any possible pinching of the member and then forced on the wheel by the device which is case hardened and nickel plated. It is compact, weighs less than three ounces and is inexpensive.



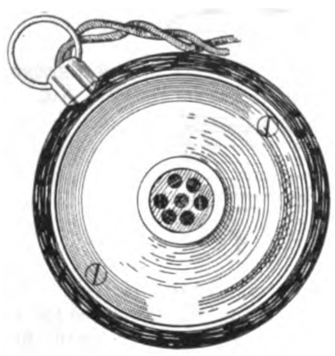
TOBEY Q. D. RIM REMOVER

* * *

The Bull's-Eye Spark Plug is a device manufactured by the C. G. Blickensderfer Company, Stamford, Conn., which will appeal to motorists as by it the initial step toward remedying ignition troubles is said to be facilitated. Usually when the motor begins to miss, the spark plug is examined, frequently requiring the removal of the member. The Bull's-Eye appliance consists of a regular plug having three windows in the hexagon nut. These are of crystal and through them the spark may be observed. If none be present the faulty cylinder is located promptly. If working properly, a blue light will be visible, and if a bad mixture is being utilized, a yellow light will be seen. The crystal ports are guaranteed against breakage.

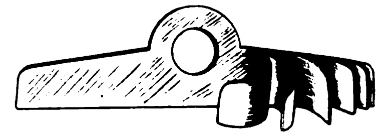
* * *

An Electric Cigar Lighter has been brought out by C. Cowles & Co., New Haven, Conn., maker of automobile lamps, exterior and interior mountings and fittings, etc. The device is similar to a watch, being about two inches in diameter and fitted with a ringed handle for the purpose of hanging to a convenient place on the car. It is made of polished brass, nickel, silver or gun metal and mounted in cocobola, ebony, mahogany, or a maple case and may be obtained in blue, drab, green or maroon if desired. The tip is wound with genuine platinum wire which is heated by a six-volt current when a circuit is completed by means of pressing a small knob. The tip of the cigar is lighted by being brought in contact with the heated platinum. A silk cord of ample length is employed for making connection to the battery.



COWLES ELECTRIC CIGAR LIGHTER

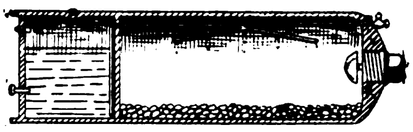
Lindhe Laminated Shims will appeal to motorists who do their own repair work as well as to experienced mechanics, as the construction of the device permits a perfect reduction of a shim without the usual filing or scraping when a solid material is employed. In taking up main bearings and connecting rods, the desired space is filled easily with the Lindhe member as it is made of thin layers of brass held firmly together by a metallic binder. Each layer allows an accurate adjustment of .001 inch. To use the shim, one corner of a layer is loosened and peeled off, and this operation repeated until the proper size is obtained. In overhauling bearings of motors it should save time as well as labor. It is manufactured and marketed by the Lindhe Shim Company, New York City.



LINDHE LAMINATED SHIM

* * *

The Carbo-Light Tank is manufactured by the Carbo-Light Company, Anderson, Ind., and it is claimed the device generates gas only when the lights burn and that it furnishes a clean, dry acetylene, which is filtered under pressure and may be charged easily. It consists of a steel, rust proof tank, constructed of a high grade material and is six inches in diameter and 22 in length. It comprises two compartments, the smaller being for water and the larger for the carbide, six pounds of which may be used. The latter is introduced through a large opening which is fitted with a screw plug, while a smaller similar member located on the top of the vessel is utilized for replenishing the supply of water. A small cup is fitted to the larger plug and in this is placed a little water before replacing the part. This fluid acts upon the carbide, generating gas until the large chamber is filled. It is claimed by the maker that there is a constant supply of acetylene of high quality, that the tank is charged easily, and that an economy of carbide is effected.



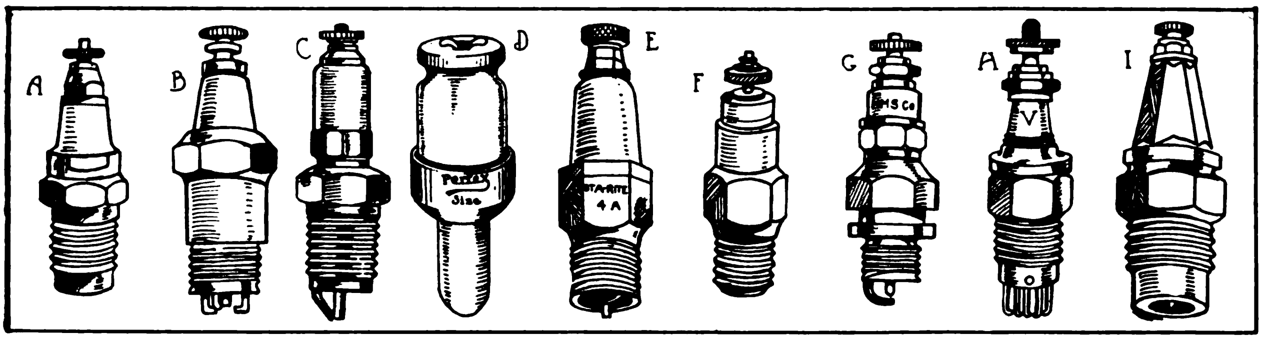
CARBO-LIGHT TANK GENERATOR

LIBRARY OF THE UNIVERSITY OF CALIFORNIA

DEVELOPMENTS IN SPARK PLUGS.

The spark plug industry has been increased the past year by advent of a number of enterprises that produce plugs as a whole or a part of their manufactures, some of them on extensive scales, but there has been comparatively little brought out that is really new. There have been no radical changes in principle, and aside from construction or methods of manufacture the variance is trifling. There is no question, however, that there has been endeavor made to secure more enduring and more reliable plugs, and this has led to improved workmanship and more careful production with a view of eliminating conditions that make for failure under the extreme heat and the continuous vibration. Of course the main proposition with all manufacturers has been to develop plugs in which a spark of sufficient proportions will be produced under the widest change of operation, and to obtain such results attention has been directed toward more accurate machine work and especial care in assembly and test of the finished product.

The introduction of highest class machinery has been a reason for material improvement, and the utilization of special gaskets to insure against leakage and loss of compression, the adoption of forms to eliminate or minimize twisting and breaking stresses, the better insulation of the electrodes and the protection of the mica and porcelain cores, the shaping of and placing the electrodes to make certain the creation of a sufficient spark, and the installation of means for visual observation of the spark, are among some of the features of the latest plugs. It will be understood that the use of special machinery means interchangeability of the parts, which makes for decided economy when a motor is in operation for a season in a vehicle. Though there are those who specialize the cheaper forms of spark plugs there are others who are producing the highest classes and the prices range over quite as wide a scale as in previous years.



Spark Plugs: A, Miller; B, Bosch; C, Mosler; D, Perfex Porcelain; E, Sta-Rite; F, Herz; G, H. M. S.; H, V-Ray; I, Splitdorf.

Bull's Eye.

One of the most interesting of the new plugs is the Bull's Eye, made by the G. C. Blickensderfer Company, Stamford, Conn. This plug has a heavy brass shell with the upper end forming a hexagon seat for the wrench. Three sides of the hexagon are drilled and into these threaded holes are seated heavy quartz lenses. The core is in two sections with the electrode divided to form a spark gap. The lower part of the core is contained in the shell and the upper section in the bushing. The bushing is seated into the shell bringing the electrode ends into correct relation. At the base of the core the electrode projects below the base of the shell and the shell electrode is extended toward the centre, forming the second spark gap of the plug. The core is of porcelain and it is capped with metal, above which is the terminal. As the spark is made it appears in the chamber of the spark plug as it ought to appear in the cylinder. It is claimed that by the use of this plug it is possible to detect a defective circuit, faulty carburetion or leaky valves, and to maintain a condition insuring satisfactory combustion, as well as protecting the engine against carbonization.

Visible.

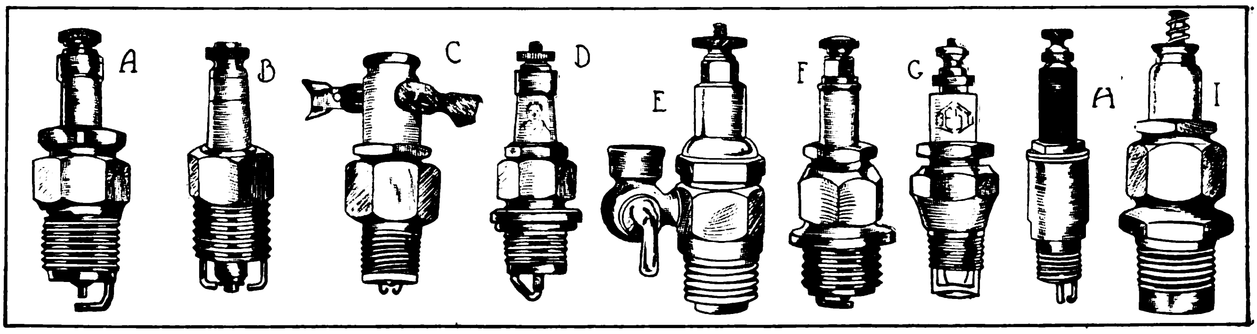
Somewhat similar to this is the Visible spark plug, made by the Visible Spark Plug Company, Detroit, Mich., which has a porcelain core through which is a transverse hole. This hole is open to the air and it exposes the core electrode which is divided with the parts so set that they require the current passing through the electrode to jump the air gap. Through the hole the size and color of the spark may be observed. Aside from this the construction of the plug is conventional, the core electrode projecting and the shell electrode extending toward and below the centre of the core. For this plug the maker claims that the condition of the electrodes, the quality of the ignition and the efficiency of the battery and the magneto may be learned by observation; the engine may be timed without trouble, and the firing spark is intensified with more instantaneous combustion and greater power.

Rex.

The Rex spark plug, made by the Rex Ignition Manufacturing Company, New York City, is another production for which particularly strong claims are made. It is the manner of construction that is maintained to give unusual results, in that the plug is guaranteed not to be short circuited through soot or from any other cause, and it is held that with the unusually hot spark produced the electrodes are constantly free and clear. The plug is exceedingly simple and it is made in all sizes for automobile, yacht and motorcycle engines. The porcelains are of finest material and guaranteed to withstand the heat. The electrodes are of specially imported wire which will not burn under intense heat.

All-in-One.

The All-in-One spark plug, made by the Frontier Specialty Company, Buffalo, N. Y., is of conventional design aside from the installation of a compression relief and priming cock at the top of the shell. These cocks are of differing shapes and lengths to permit installation of the plugs in motors of various types,



Spark Plugs: A, Hot-Spark; B, Jewell; C, Edison; D, Red Head; E, All-in-One; F, Firefly; G, Best; H, Sootless; I, Black Eagle.

whether conventional, horizontal or with recessed plugs. These are specially adapted for engines which are not equipped with compression release cocks, either for automobile or marine purposes. By priming the motor at the spark plugs it is claimed that starting is facilitated under any circumstances, while cleaning may be accomplished without difficulty by use of gasoline on the spark plugs, or kerosene may be utilized for freeing the cylinders of carbon.

H. M. S.

The H. M. S. spark plug is made by the Hartford Machine Screw Company, Hartford, Conn., under pending patents and was designed with experience obtained in the manufacture of more than thirty millions of plugs for others. The porcelain, for instance, is made from imported clay and it is of a form that is claimed to give heretofore unknown strength. The porcelain has but one gasket for making up the joint in the body, the design being such that the expansion and contraction of the core and the metal parts are practically in one direction, minimizing all possible strains. The plug is gas tight and has survived every test. The core and core electrode are assembled as one unit and can be removed from the shell by unscrewing the bushing. The core electrode extends below the shell and the shell electrode curves under it. The design is such that an unusually hot spark is created and it is claimed that if the electrodes are completely immersed in oil the plug will spark continuously and indefinitely and without miss.

Mac-Kae.

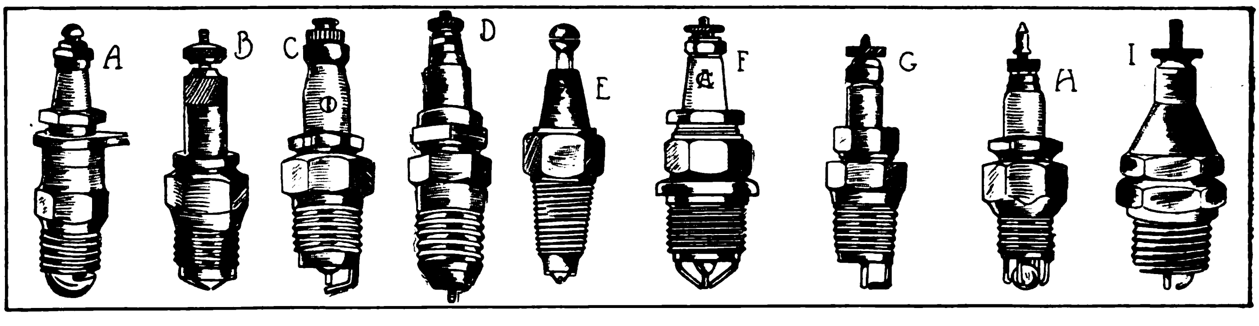
The Mac-Kae spark plug, made by the Mac-Kae Manufacturing Company, Boston, Mass., is claimed by the maker to give a very large and efficient spark and to afford superior ignition under all conditions. It is made with either porcelain or mica core. The porcelain cores are made with the core electrode of an alloy of platinum-iridium and nickel baked into the core, and as this electrode has the same coefficient of the porcelain, is not affected by the extremes of heat. The cap of the core is keyed on by a patent process, a solid unit being formed. By unscrewing the brass bushing of the plug the core may be removed as one piece. With the mica cores the centre electrode is wound laterally with sheet mica which is surrounded with mica washers, compressed and securely locked. Both porcelain and mica cores are interchangeable with any Mac-Kae plug. These plugs are sold with a guarantee against any defect of material or workmanship. They are made in all sizes.

Bosch.

The Bosch spark plug, made by the Bosch Magneto Company, New York City, is designed specially for high-tension magneto service. The plug consists of three parts, a steel shell, a one-piece insulator and the core electrode. The insulation is of steatite, which is not brittle and will not deteriorate through extreme heat, great pressure or free lubrication, the material and form eliminating all joints and insuring against leakage under a pressure of 750 pounds to the square inch. The shell electrodes are three in number and are crescent shaped, which form is claimed to have less electrical resistance and to produce a spark that is a sheet of flame, giving an efficient ignition at slow cranking speed of the motor.

V-Ray.

The V-Ray spark plug, made by the M. M. M. M. Company, Marshalltown, Ia., is assembled with a deep shell from which four long electrodes extend downward and turn sharply toward the centre, penetrating the combustion chamber of the motor to a much greater depth than the average plug. The points of these electrodes are tapering and they converge close to the end of the core electrode, which is made with a semi-circular groove in the end. The core electrode is increased in diameter before it enters the core and it is firmly assembled and retained by a nut at the top, on which is fitted the terminal nut, which is long and tapered. It is claimed that the plug will produce an unusually fat and powerful spark and that it will not soot or corrode, the peculiar form of the electrodes making them self-cleaning. The porcelain is said to be fracture proof and the plug is sold with a very broad guarantee as to quality and service.



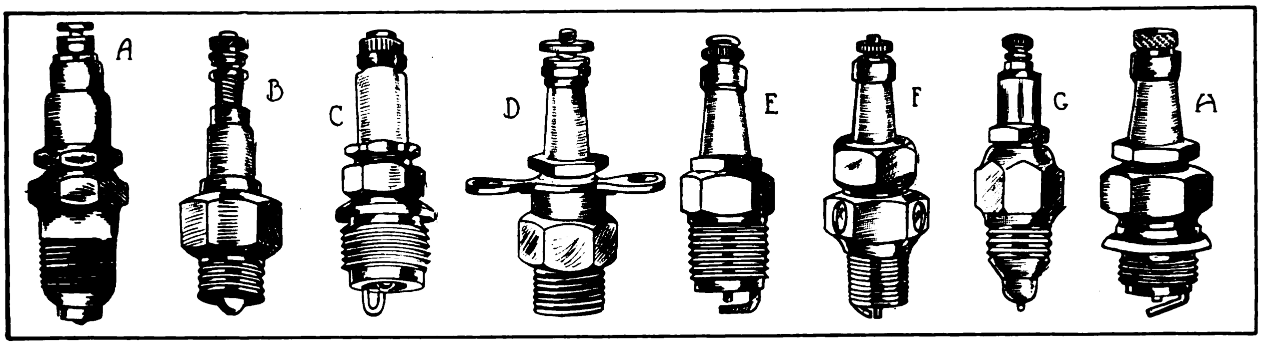
Spark Plugs: A, Spitfire; B, National; C, Visible; D, Never-Miss; E, Anderson; F, AC; G, Benford; H, T-A-D; I, Kingston.

Black Eagle.

The Black Eagle spark plug, made by the Progressive Manufacturing Company, Torrington, Conn., is a new product that is popular in price and has qualities that are claimed to be unusually efficient. The shell is of metal into which is seated a brass bushing carrying the porcelain core and electrode. The two shell electrodes are parallel and midway between them is the core electrode, and as the round surfaces of the electrodes are presented to the sparks as they are formed, this minimizes or prevents pitting and destruction of the sparking points. Between the solid cap of the core electrode and the binding nut of the core there is a sliding collar and it is normally kept in contact with the binding nut by a spring between the collar and terminal cap. Any wire winding or terminal placed between the collar and the binding nut is firmly held by the tension of the spring. This device is patented and is known as the Universal Spring Cap.

T-A-D.

The feature of the T-A-D Flash Ball spark plug, made by the Toledo Auto Devices Company, Toledo, O., is the formation of the end of the core electrode, which is a ball. The shell electrodes are four in number and these extend downward into the combustion chamber and turn sharply at right angles, the ends of the electrodes being in proximity to the greatest diameter of the ball. As the current is distributed four sparks are made simultaneously in the cylinder. The area of the ball is such that the plug is self-cleaning as well as there being elimination of all possibility of pitting and destruction of the electrode points, as might be possible with a single air gap. The plug has a porcelain core and is otherwise conventional.



Spark Plugs: A, Mezger; B, Ballite; C, Reliance; D, E-Z; E, Mac-Kae; F, Bull's Eye; G, Sharp; H, Rex.

Splitdorf.

The well known Splitdorf plug, made by C. F. Splitdorf, New York, has been improved so far as the construction of the mica cores are concerned, this being by increased taper of the steel rod forming the core electrode. This rod is wound with selected sheet mica and the mica washers are forced on under heavy pressure, the construction being such as to insure against any possibility of leakage. The appearance of both mica and porcelain plugs has been improved by the addition of ornamental washers at the top and bottom of the external insulation.

Herz.

The imported Herz Bougie Mercedes spark plug, for which Herz & Co., New York City, is American sales agent, has been perfected by installing at the base of the shell in the place of the shell electrode a disc into which four holes are cut so as to remove the centre and leave four points which are equally spaced from the core electrode. When the current is made and broken four sparks are formed simultaneously and there is proportionately increased combustion in the cylinder. The insulation of the plug has been protected by a coating of blue enamel, which adds to its appearance.

AC.

The Champion Ignition Company, Flint, Mich., has produced the AC Star spark plug in which the porcelain insulation is in three parts and the electrode is divided. The base carries the core electrode and there is a recess about the upper parts of the electrode into which a porcelain tube that surrounds the electrode is fitted. Above the tube is a spring that surrounds and contacts with the lower end of the electrode in the upper porcelain section. About the upper section is the bushing that seats into the shell. This construction is said to insure against breakage from vibration, heat or expansion. There are two shell electrodes and two sparks are made in the cylinder at the same time. The AC Waterproof plug is made with practically the same construction as the AC Star, but it has a peculiarly formed porcelain hood and combination terminal that is connected with the cable and clamped on to the plug in place of the upper porcelain. The other lines of this concern have not been changed.

Champion.

The line of the Champion Spark Plug Company, Toledo, O., which is said to be produced in the largest spark plug factory in the world, includes six models, five of them with porcelain cores and one with mica core. These are to meet differing needs with different types of motors—in fact the company claims to make a plug for absolutely every type of engine. These plugs are sold with a guarantee against breakage by heat.

Miller.

The Miller spark plugs, manufactured by Chas. E. Miller, 97-103 Reade street, New York City, include mica, porcelain and magneto types. The magneto plug is made with a shell, the circular base of which forms the electrode. From the porcelain core the electrode terminates in a disc with a serrated edge, and between the points of the disc and the shell a number of sparks are formed each time the current is made and broken. The Miller mica plug has been manufactured for seven years and the porcelain plug was produced to meet a demand for this type. It has a deep seat in the cylinder and a long centre electrode, insuring rapid and complete combustion in the engine cylinder.

Flash Light.

The Flash Light spark plugs, made by Janney, Steinmetz & Co., Philadelphia, Penn., have been continued without material change in design and are produced with the same care and with the superior facilities and material that has established them as a standard product in the market.

Standard and Reliance.

The Jeffery-Dewitt Company, Detroit, Mich., has increased its product by the addition of the Standard, a popular priced spark plug which has many of the qualities and features of the Reliance line, which is finished a dull black. With the Reliance plugs a feature is that the core electrode is a fine platinum wire baked into the porcelain and finished flush with the lower end, this being amply protected, while the intense heat generated by the spark has a cleaning influence. This company also produces the Edison Double Spark plug, which has not been changed in design.

Sta-Rite.

The production of the R. E. Hardy Company, Chicago, Ill., which includes the Sta-Rite, Venus, Vulcan and Gotham spark plugs, have been practically unchanged, these products being sold under a broad guarantee of satisfaction. The Hardy line has been developed and manufactured on nine years' experience.

Best.

The Best plug, made by the Best Ignition Equipment Company, New York City, is designed with a bushing that affords direct pressure on the porcelain core without a twisting stress, and the core electrode is a circular disc centred in the base of shell, the spark forming at varying points the entire circumference of the disc.

Delta.

Practically no change has been made in the models made by the Delta Manufacturing Company, Bloomfield, N. J., these being continued because of the extreme satisfaction obtained through long and continued use.

Spitfire.

The buyers of Mosler Spitfire and Breechblock plugs are now offered the option of purchasing porcelain cores in which the electrodes are tipped with platinum, as a further resistant to deterioration. Other than this the plugs are made to the original designs by A. R. Mosler & Co., New York City.

Hot-Spark.

The Hot-Spark spark plug, made by the Hot-Spark Plug Company, Detroit, Mich., is composed of five pieces, the shell, bushing, gasket, porcelain core and electrode and the terminal nut. These are solidly constructed and the bushings are case hardened to resist contact with wrenches. They are especially designed for use with self-starting engines, where the spark required for ignition is hot and strong.

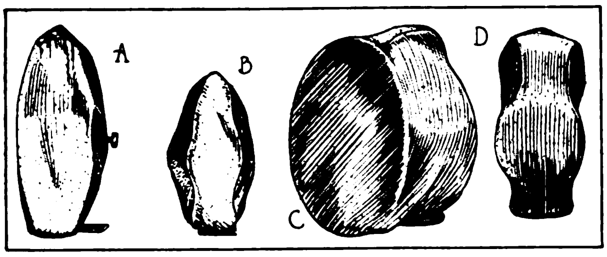
Fire-Fly.

The Fire-Fly and the Sharp spark plugs, made by the Sharp Spark Plug Company, Cleveland, O., have been practically unchanged, the former being with porcelain core only, and the latter with both mica and porcelain.

The Monarch spark plugs, made by the Benford Manufacturing Company, Mount Vernon, N. Y.; the Ideal spark plugs, made by the Ideal Switch Company, Plainville, Conn.; the Never-Miss spark plug, made by the Lockwood-Ash Motor Company, Lansing, Mich.; the Sootless and Comet plugs, made by the Oakes & Dow Company, Boston, Mass.; the Anderson spark plug, made by the Anderson Spark Plug Company, Washington, D. C.; the E-Z spark plug, made by the Autoparts Manufacturing Company, Jersey City, N. J.; the Kingston spark plug, made by the Kokomo Electric Company, Kokomo, Ind.; the Mezger spark plug, made by C. A. Mezger, Inc., New York, N. Y.; the Jewell, made by the Pittsfield Spark Coil Company, Dalton, Mass.; the Ballite, made by the G. A. Walker Machine Company, Boston, Mass., have been continued practically without change. These are all standard plugs, are well known in the market and are extensively used.

NEW DESIGNS FOR LAMP COVERS.

The benefits accruing from fitting covers to the lamps of the motor car are numerous, and there is a growing tendency to protect the lights from moisture and the inclemency of the weather. Where gas and oil members are employed particles of dust find their way into the burners, etc., impairing service. In traversing muddy roads the covers not only prevent the accumulation of dirt but preserve the brightness of the metal.



Hopewell Lamp Covers: A, Square Side; B, Tail; C, Searchlight; D, Round Side.

Hopewell.

The design of the lamp covers manufactured by Hopewell Bros., Newton, Mass., is such a perfect fit is assured, and these members are made to conform to the shape of any standard lamp. They are made for head, side and tail lights, and generators as well. The lamp covers are of rubber, fleece lined, although fabric leather in colors is produced. The devices are fastened easily by a patent clasp, are inexpensive, and are unaffected by heat, water, grease or dirt.

Gilbert.

The Gilbert Manufacturing Company, New Haven, Conn., makes a specialty of covers for side, head and tail lights for automobiles. These are manufactured in a variety of designs to meet different requirements. They are so constructed that they fit the lamp snugly and the flaps are secured by clasps and straps, the latter being utilized on the head devices.

Premier.

Water and dust proof lamp covers form a part of the production of the Premier Novelty Manufacturing Company, New York City, which concern manufactures these devices in many shapes and sizes to conform to the standard lamps upon the market. The company claims to be the original concern to utilize the button lock flap cover, with which its goods are equipped.

Cowles.

C. Cowles & Co., New Haven., Conn., produce a large variety of lamp covers, these being made in standard forms to fit oil, gas and electric lamps. The covers are water proof, with seams sewed and cemented, and the material comprises a lustre or a dull finish. The concern makes a specialty of covers for limousine lamps, these being manufactured with an improved seamless head.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS

Hawkins, the commercial manager, afterwards visiting the plant of Dodge Bros. In the evening a banquet was served at which Mr. Hawkins was toastmaster.

The Henderson Motor Sales Company, Indianapolis, Ind., distributor for the Cole car, made by the Cole Motor Car Company of that city, announces the following new agencies: Z. C. McIntire, Montgomery, Ala.; Northern Automobile Agency, Talladega, Ala.; H. C. Dunlap, Napa, Cal.; Patterson Motor Sales Company, Hamilton, Ont., Canada; Fleming & Brown, Kankakee, Ill.; A. L. Alexander, Waterloo, Ia.; E. B. Elliott, Audubon, Ia.; W. F. Peterson, Sibley, Ia.; E. E. Freeman, Oakland, Ia.; C. F. Welmerling, Storm Lake, Ia.; E. D. Blaisdell, Dexter, Me.; Arthur P. Libby, Fort Fairfield, Me.; J. H. Penniman, Kalamazoo, Mich.; Johnson Motor Car Company, Duluth, Minn; J. H. Brown, Eveleth Auto & Repair Company, Eveleth, Minn.; Crescent Garage Company, Ogdensburg, N. Y.; George Leonard, Auburn, N. Y.; C. R. Wise, Watertown, N. Y.; Loyd's Garage, Oneida, N. Y.; Cole Motor Sales Company, Peebles Corner, Cincinnati, O.; C. H. Schubert, Barberton, O.; Ernest K. Hoge, Martins Ferry, O.; G. E. Sullivan, Oregon City, Ore.; Central Garage, Williamsport, Penn.; Chas. E. Barkl, Aberdeen, S. D.; R. L. Holcomb, Rapid City, S. D.

Lucius E. Wilson, former secretary of the Detroit board of trade, has entered upon his new duties as vice president and general manager of the Warren Motor Car Company of that city, maker of Warren cars.

The Cork Insert Company, Boston, is mailing the trade a folder dealing with costs of cork inserts in practise, also a diagram curve of different types of pulleys.

The Pope Manufacturing Company, Hartford, Conn.; is contemplating a four-story addition to its plant, furnishing 60,000 additional square feet of floor space.

The Van Motor Car Company, Grand Haven, Mich., has been purchased by H. M. Pierce, J. A. Owen and Mrs. L. M. Strong of Grand Rapids, Mich. Mrs. Strong is president; M. M. Pierce, vice president, and J. A. Owen, secretary and treasurer. They will build the Pioneer roadster.

The Oakland Motor Car Company, Pontiac, Mich., announces that a branch house will be established at San Francisco, Cal., which will be utilized as a distributing point for Oakland cars in the western territory. A large stock of parts, etc., will be carried and a service department established. Henry L. Hornberger will be manager.

The United States Tire Company, New York City, has opened a state branch at Des Moines, Ia., at 406 West Ninth street. W. H. Mesenbrink, who has represented the company in Iowa and Nebraska for eight years, will manage the branch which will devote its efforts exclusively to the wholesale distribution of the various tires made by the New York concern.

The Standard Woven Fabric Company, Worcester, Mass., maker of Multibestos, has increased its selling branches, having closed with Petry-Cassidy, Inc., 1416 Vine street, Philadelphia, as agent in Pennsylvania and the South, also James G. Barclay, 720 Main street, Buffalo, N. Y., the latter to act as sales agent through central and western New York State.

PUBLISHED THE 15TH OF EACH MONTH.

SUBSCRIPTIONS:
The United States and Mexico, the year, $1 in advance; Canada and Foreign Countries in Postal Union, the year, $2 in advance. Fifteen cents the copy.

CONTRIBUTIONS:
Anonymous communications not considered. Correspondence on subjects relating to the motor industry and the trade will receive attention. Stamps must be enclosed to insure return of unsolicited contributions.

ADVERTISING:
Information supplied at request.
Advertising Copy for the ACCESSORY and GARAGE JOURNAL requiring submission of proof must be received by 5th of month to insure publication in issue of the 15th of month.
Advertising Copy, proof not required, accepted to morning of the day before publishing day (unless such day is Sunday or holiday, when previous day is limit) of each publication.
Remittances should be made by Check, Draft, Postoffice or Express Money Order, or Registered Letter. Money enclosures must be at sender's risk.

CODE OF DRIVING SIGNALS.

The highway traffic is increasing constantly and its volume at times and in certain thoroughfares in communities of considerable proportions is sufficient to congest badly. The progress of the slowest establishes the fastest pace for all. This condition may be regulated by locality regulations. But no municipality or state requires uniform observance of driving signals. There is international recognition of marine signalling. This is for the benefit of all alike. The demands for a code that will afford universal protection for all persons using the roads and streets, no matter whether in vehicles or pedestrians, are immediate and imperative. To establish a universal system of visual and aural warnings of approach and movement, that might be given by equipment now the vogue, or what could be installed at trifing expense, is necessary. In this country there are 48 states, each with different laws and regulations. One would be sufficient and could be better understood and enforced. It is not possible to bring about such a change unless there is unanimity of opinion. No one has a better reason to advocate such a change than one in the industry or trade, and no one can more consistently direct endeavors to bring about a demand for the protection suggested. There must be initiative and there must be unfailing energy and confidence. There is no possibility of reward. Here is opportunity for individuals and bodies of men organized for promotion of pleasure and business to accomplish a very large measure of good. Who could better undertake such a universal public benefit than those interested in a business way?

GARAGE HELP PROBLEM.

The public service station, as does the stable, attracts a class of visitors whose business may be either destructive of time or property or both. That these undesirables appear, however, is largely due to tolerance by the employees, and usually the attention suffers in proportion to the number. There is no assurance that honesty is a predominating quality, and in the absence of anything that might be regarded as establishing direct suspicion there can hardly be the confidence maintained by the customers that would obtain under other conditions. There is a class of labor about garages that is not paid well enough to insure integrity and it can be said that it is this element that causes the greater part of the troubles of the owner or manager. There appears to be but one certain remedy, and that is to remove all temptations, which can be done by locking or keeping record of everything that could be appropriated and making certain a responsibility for those in charge.

EXCHANGE OF EXPERIENCES.

Those who conduct garages and repair shops often have occasion to direct work upon cars practically unknown to them, and while it may be said that the majority of vehicles are the same in general principles, they often differ materially in design and construction. Naturally work on machines unfamiliar to the men requires longer time than on those better known, and it may be that it is not as well done. In any event it is more expensive. One of the chief attractions of the shows for the expert repairer is to perfect a knowledge of every car exhibited, and the more time that can be devoted to this work the better. Beyond this it is desirable that head mechanics exchange their experiences, not for the purpose of discounting constructions or methods, but to benefit each other in the work that each expects to do. The automobile repairer is often discredited because he cannot do with all cars, what he can do with one. The best he can do is to attempt to improve himself, and he can do so through an exchange of experience.

VALUE OF TRADE INFORMATION.

The man who succeeds best knows his business, the possibilities of the market, what his competitors are doing, and takes advantage of opportunities. To refuse knowledge that is absolutely necessary, and can be obtained from dependable sources, is a failure that cannot be justified. Information relating to the industry is indispensable to the buyer, who has the choice of the best the market affords, what is in greatest demand, and can maintain a stock that always commands attention. The man who neglects to study his business possibilities is hopelessly anchored. If he fails it is because he would not do what he could do.

WHO'S WHO IN THE INDUSTRY.

WILLYS ACQUIRES GRAMM PLANT.

A transaction of importance to the automobile industry is announced in the statement that John N. Willys, president and sole owner of the Willys-Overland Company, maker of Overland cars, and allied interests, has purchased the controlling interest in the Gramm Motor Truck Company, Lima, O. The amount of money involved in the deal has not been made public, but it is understood to have been one of the largest transactions of this character in the history of the motor car.

John N. Willys, President Willys-Overland Company.

It has been known for some time that Mr. Willys was casting about for a truck plant which was equipped as he thought it should be to meet the requirements and demands of the commercial car users of America, and particularly with ~~reference~~ to the business arrangements of the more than 2000 Overland dealers throughout the country. The selection of the Gramm plant appears to be in keeping with this desire.

Mr. Willys' success in building up the production of Overland cars since he became identified with that company, is ample assurance that the future of the Gramm truck will be along liberal lines. It is understood there will be no change in the policy of the concern, except in the matter of broader production facilities, and in line with this suggestion, B. A. Gramm, one of the most experienced commercial vehicle manufacturers in the country, will be associated with Mr. Willys in working out the problem.

The Gramm plant is said to be the largest truck factory in the world, devoted exclusively to the manufacture of industrial transports. The buildings are located on 22 acres of ground, and 1200 men are employed. All of the equipment is of the very latest and best to be had, and the automatic machinery is the most modern in design. The buildings are of steel and reinforced concrete, and are valued at $1,250,000.

SUCCESS WITH LENOX CARS.

Few young men have had better success in the sale of automobiles than William Blanchard, who has just been promoted to become sales manager for the Lenox Motor Car Company, 3368 Washington street, Boston, Mass., maker of Lenox cars. He has been associated with this concern less than a year, and during that time has demonstrated his remarkable ability along this line.

Mr. Blanchard has been connected with the motor car industry for the past five years, and has a wide circle of friends and acquaintances, particularly in the New England states. Undoubtedly, a large measure of his success is traceable to this fact, although he possesses personal qualities which make him one of the best salesmen in this district.

William Blanchard, Sales Manager, Lenox Motor Car Company.

Perhaps the greatest secret of all is his thorough familiarity with the construction of an automobile. He gained his rudimentary knowledge of motor cars with the Easton Machine Company, Easton, Mass., maker of the Morse car. Here he worked in every department, serving his full time at the bench and in the shop. It was while acting as salesman for Morse cars that the Lenox company induced him to undertake the exploitation of the Lenox line.

AN ENTERPRISING SHOW MANAGER.

In the face of what was believed to be almost certain failure, Thomas I. Cochran, who was the directing head of the first automobile display ever held in Pittsburg, Penn., was able to rally a large number of the dealers of that city to his aid and succeeded in presenting the most elaborate and artistic display the city has known. It was held in the Exposition building under the auspices of the Pittsburg Automobile Show Association, and despite the fact that some of the local dealers had already held an exhibition, Mr. Cochran's great success appears to have established the fact that the show under his management is considered as the really big event of the year.

Thomas I. Cochran, Manager Pittsburg Exposition Show.

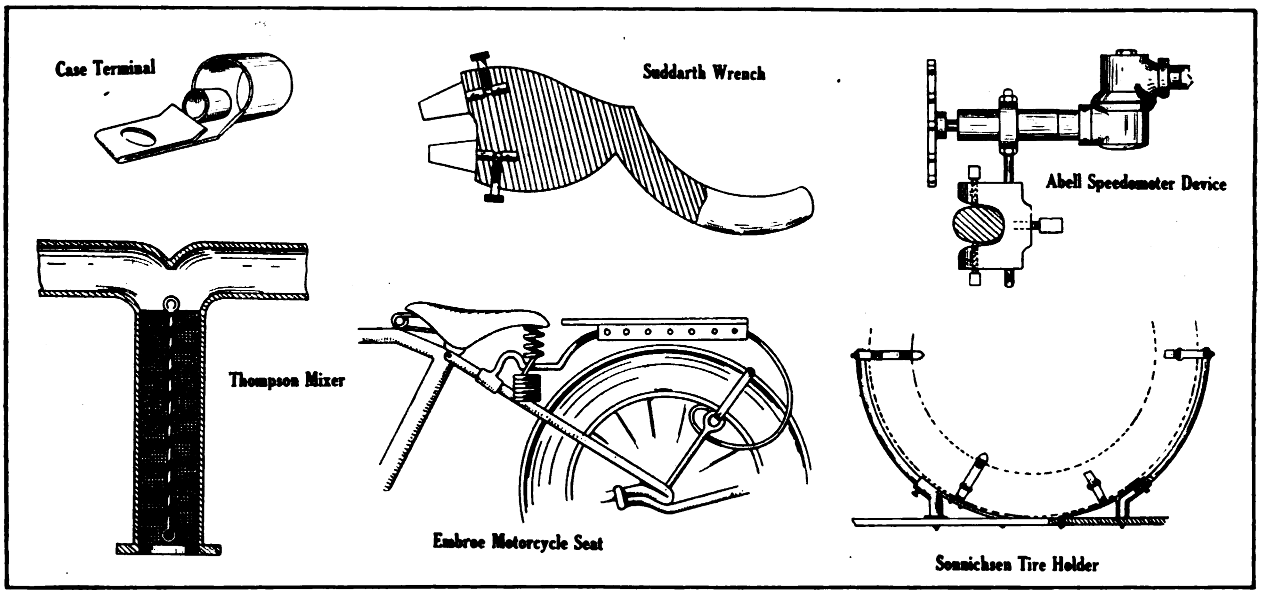
RECENT PATENTS of INTEREST

Case Terminal.

Frank E. Case, Schenectady, N. Y., assignor to the General Electric Company of that city, has been granted a patent for a terminal for electric conductors. It consists of a metal strip having holding clips formed at opposite ends, these being arranged so as to be coaxial and to engage adjacent portions of the conductor. It is stated of the device that the larger clip holds the insulated member securely and that the wire or conductor may be fastened equally as well.

Thompson Mixer.

To secure the greatest efficiency from a hydrocarbon motor it is necessary that the fuel be mixed thoroughly with the atmosphere and in the proper proportions. Sometimes through faulty action of the vaporizer raw gasoline is drawn into the manifold and combustion chamber, impairing action of motor. Frederick Foster Thompson, Lawton, Okla., has been granted a patent for a mixer for gaseous fluids adapted to be inserted in the intake manifold between the carburetor and the combustion chamber. It comprises a tube or cylinder of perforated material and a rod arranged axially of the tube. This rod carries a helical wing or vane of perforated material and this is in contact with the edges of the tube. It is claimed by the inventor that the swirling motion imparted to the mixture drawn in by the suction of the piston breaks up any particles of fluid, and that carburetion is improved thereby.



Some Recent Patents Applicable to the Motor Propelled Vehicle, Including Case Terminal, Suddarth Wrench, Thompson Mixer and Embree Motorcycle Seat.

Suddarth Wrench.

A wrench of which the inventor claims a quick adjustment of the jaws is the subject of a patent issued to Archibald S. Suddarth, Monterey, Va. It consists of a wrench stock having a head provided with deep cylindrical depressions. A pair of revoluble jaws having eccentrically arranged shanks and provided with annular grooves is fitted within the depression. By means of pins fitted through the head of the tool and extending into the grooves of the shank, the jaws are swivelly adjustable. The jaws are rectangular in cross section and taper longitudinally, thereby forming a plurality of nut engaging faces. In practise these jaws are rotated until the desired opening is secured.

Abell Speedometer Support.

Rollin Abell, Boston, has been granted a patent for a supporting device for speedometer driving mechanism. It comprises a split collar having lugs or ears, a threaded rod and a fork shaped block. The collar is clamped over the bearing sleeve of the speedometer driving mechanism and locked securely by nuts. A vertical rod is also locked to this collar and carries a block which is moved up or down as desired in making an adjustment to mesh the driving and driven gears of the speedometer. The block is equipped with three set screws, one of which is utilized to lock the block in position and the other members the knuckle of the wheel.

Embree Motorcycle Carrier.

Many motorcyclists utilize their mounts for carrying packages and at times desire an extra seat when transporting two persons. Clarence J. Embree, Tacoma, Wash., has been granted a patent for a seat and carrier attachment which comprises a fork having its ends secured to the rear axle and having its intermediate portion spanning the rear wheel. Resilient members are incorporated each having one end secured to the fork and the other to the frame of the machine. The seat is equipped with flanges extending downward at the sides of the resilient members and means are provided for resiliently holding the seat in position to permit of slight longitudinal movement on the spring members. Set screws are utilized to fasten the seat securely.

Sonnichsen Tire Holder.

Some motorists object to attaching tire holders to the body of the machine, preferring to carry the extra casings on the running board. Andreas M. Sonnichsen, Milwaukee, Wis., assignor to the Auto Parts Manufacturing Company, has invented a tire holder of the running board type, which is so constructed that it may be adjusted to accommodate different sized shoes. It comprises a pair of independent tubular curved brackets, these being fitted with extensions for the purpose of fastening securely to the running board. Extensions are fitted into these supporting members and means are incorporated for securing the parts. The curved brackets are moved toward or away from each other to accommodate tires of different diameter and are fitted with curved members for the purpose of fastening the shoes thereto.

Hand Starting Device.

Considerable attention is being given to the matter of starting the gasoline engine and the forms of mechanism to do this work have been many and various. That a large number of them have been brought out will not be disputed, or the fact that not all are practicable. In the device under consideration here and shown in the sketch on this page, the inventor has restricted himself to a detail; that of arranging a lever and a ratchet so as to avoid any kick-back on the operator.

In doing this two ratchets have been necessary, one slightly curved, the other a full wheel, and each with its pawl. One of these is attached to the grip of the lever by means of a push button for releasing it, while the other is normally held in position by a spring. The general scheme for a lever arrangement which could be placed on an extension of the main quadrant at the driver's right hand so as to operate from the seat is a good one. It is the invention of Robert McKee, Philadelphia, Penn.

Carburetor with Peculiar Feed.

In his new carbureting device, Arthur J. Weiss, West Orange, N. J., patent 993,210, has departed considerably from the conventional, in a few respects at least. First there does not seem to be any float, the fuel supply being governed by means of the usual needle valve and spraying nozzle combined in one and worked by means of a piston, upon which the suction operates.

A heavy draft would pull this upward and open the fuel aperture wide admitting much gasoline, while a small draft would not open it as much. Vibration back and forth is prevented by means of a large diameter spring, while the upper end of the piston shaft carries a small piston, which works in a secondary cylinder to which gas is admitted by means of a bypass from the main pipe beyond the throttle. This would equalize the pressure on each side of the throttle, and assist in steady, regular action. In addition, the auxiliary air inlet comprises a series of radial slots, tapering from the inlet down to a small opening. Each of these leads to the fuel distributor in the mixing chamber, the connection being by means of a radially slotted body, the slots of which communicate with the fuel inlet passage. If the devices incorporated in this invention will do the work, the inventor will have simplified carburetors very markedly.

New Form of Automobile Lock.

Among the number of motor car locks, recently patented in this country, there is shown in the sketch herewith, a novel form. This is the invention of two Philadelphia men, Charles R. Parker and Reuben D. Wirt, patent 992,444, the same having been assigned to the General Utility Company, of the same city. This consists of a flat base, with projections which would go into the usual quadrant bars, and means for holding the levers, while a projection above matches a loop added to the quadrant so that a lock may be slipped through both, thus holding them together firmly. It is removed by unlocking and taking off the padlock, when the entire plate can be lifted out.

Interesting Patents Connected Primarily with the Automobile, Including Carburetors, Starting Devices, New Forms of Transmissions, Lock and Rear Axle Arrangement.

Gentle's Carburetor Form.

Another new idea in the way of carburetors is that of William M. Gentle, Greenwood, Ind., patent 993,516, in which a very slight difference is noted. This consists, as the sketch shows, of an auxiliary air valve operated by the suction of the pistons, and thus, automatically. It is, comparatively speaking, non-adjustable. A swinging flap valve is placed in the manifold just above the vaporizer and directly behind the throttle valve, which is retained on its seat by means of a light spring capable of being varied slightly by an external screw. A strong suction would, through the shape of the pipes, draw this flap open and admit additional air to dilute the mixture, which is apparently the object of the inventor.

Electric Driving Arrangement for Autos.

Since the automobile was first brought out, inventors everywhere have been trying to apply the high starting torque and other big advantages of the electric motor to the motor car. The latest in this line is shown in a sketch herewith, being the product of two Englishmen, A. H. Midgeley and C. A. Vandervell, patent 993,611, the latter the well known ignition specialist. This consists primarily of a dynamo armature, a motor armature and a common field, the latter being placed around the dynamo, while the motor surrounds it. There is in addition a means for moving the field magnets laterally, as well as separate excitation, while the wiring provides for the usual connections of motor with dynamo for high speed driving, when the whole is locked together and rotates as a unit. An unusual feature is noted in the mechanical clutch—a cone of good size—used for connecting and disconnecting the electrical outfit with the engine shaft. In addition, a purely mechanical drive, straight through, is provided for.

Schmidtmeier's Cranking Arrangement.

This arrangement of parts here is such that the engine power is used to wind up a spring, which is ratchet retained, although a pulley is provided by means of which power could be stored in the spring from another source. It is the invention of Joseph A. Schmidtmeier, Pendleton, Ore., and the patent, 993,885, concerns itself mainly with the details of the ratchet arrangement, little or nothing being said about the spring or other source of power.

In the ratchet device, as the drawing shows, there is a pawl pivotally mounted upon a lever with a small coil spring to hold it into engagement. It would not, however, touch the ratchet regardless of the spring except when the lever is pulled back by a lever and rod connection. This the driver is intended to operate, the arrangement being such that a pull on the connecting rod would throw it into engagement. The engine or other source of power would then wind the spring, leaving it ready for use. This would be the case, until the operator again pulled the lever which operated the entire device, when the pawl would be pulled out of mesh, and the spring would begin to unwind and turn the engine over.

Friction Form of Transmission.

In the substitute for a gearbox, invented by E. S. Marsh and R. M. Marsh, Rochester, N. Y., and upon which they have been granted patent 994,017, three friction discs are employed. Two are parallel, while the third sets at right angles being arranged to contact with the face of one and the periphery of the other. The mainshaft carries the two wheels, being broken in the centre, and having one wheel fixed to one part and the other keyed so as to slide upon the other. The third member is an intermediate wheel, being designed to drive off the face of the first rotator, and upon the periphery of the third.

By moving the latter across the face of the intermediate, the variation in speeds is gained, the first and intermediate connection resulting in a single speed. Arrangement is also made for throwing the intermediate wheel out of engagement, at which time the final member may be engaged with the first of the series by a clutch face machined on both, thus providing a direct drive. Besides being direct, this would be a strictly mechanical connection as compared with the frictional contact of the others.

Spur Gear Final Drive.

In the rear axle driving arrangement, upon which patent 994,019 has been granted J. D. Maxwell, Tarrytown, N. Y., internal external spur gears are used. This is a form of final drive which is attracting considerable attention. In the Maxwell arrangement, the usual shaft driven rear axle is carried lower down than is the ordinary case. Upon the ends, a pair of spur gears of small size is carried, these meshing upon the bottom side with a pair of similar spur members, but of larger size mounted upon the two rear wheels.

METHOD OF LACING BELTS.

In punching a belt for lacing, use an oval tool, the longer diameter being parallel with the sides of the belt. Make two rows of holes in each end, placed zigzag. In a three-inch belt there should be four holes in each end, two in each row. In a six-inch member, seven, four in the row nearest the end. A 10-inch belt should have nine holes, and the edge of these should not come any nearer than .75 inch from the sides, or .875 inch from the ends of the belt. The second row should be at least 1.75 inches from the end. On wide belts these distances should be even greater. Begin to lace in the centre of the belt and take care to keep the ends exactly in line, and to lace both sides with equal tightness. The lacing should not be crossed on the side of the belt which runs next to the pulley. In taking up belts, observe the same rules as in putting on new ones.

IRON AND STEEL TEST.

To ascertain whether a pipe is made of iron or steel, cut off a short piece and suspend it in a solution of nine parts of water, three of sulphuric acid, and one of hydrochloric acid, in a porcelain or glass vessel in such way that the end will not touch the bottom of the dish. After two or three hours' immersion remove the part and wash off the acid. If the pipe be steel it will present a bright, solid, unbroken surface. If of iron it will show faint ridges or rings, denoting the different layers of iron and streaks of cinder. In order that the scratches of the cutting tool may not be mistaken for the cinder marks, file the end of the pipe across or grind with an emery wheel until the marks are obliterated.

PROPER USE OF BELT DRESSINGS.

Belt authorities do not recommend the use of dressings unless the member becomes dry and husky. Under these conditions they are applicable. A good material to apply is beef tallow at blood warm temperature and dried by either artificial heat or the sun. The addition of beeswax is suggested if the belts are to be used in wet and damp places. Belts should not be soaked in water before oiling, and penetrating lubricants are not recommended except occasionally when the member is very dry.

CLEANING OILING SYSTEM.

When cleaning the strainer in the oiling system it is well to include the reservoir and all piping. More or less foreign matter will collect and cause clogging in this vital part of the motor's mechanism.

To Anneal High-Speed Steel—High-speed steel is annealed by heating, not by cooling. It does not require more than 12 hours for a piece 2.5 by 10 inches to cool. There are a great many ways in which this steel can be annealed. In place of a crucible use a cast iron box and some cast iron shavings from a planer or lathe, and pack your work in this. If you have not the shavings or box, take a gas pipe and pack the work in charcoal or ashes, dirt, clay, anything that will not burn on the work to be annealed. Heat it for seven hours, running the heat as high as 800 degrees C.; hold the heat at this degree at least five hours, then raise it to 900 degrees C. (cherry red); then shut off your fire and close your furnace door. Take out the steel after 12 hours. Steel treated in this way will be as soft as machine steel.

Emery Sticks Useful—To make emery sticks take a piece of pine, or other wood, about the size and shape of a file. Glue a piece of emery paper or cloth on, and after dry, use the same as a file. Sandpaper can be used the same way for work on wood.

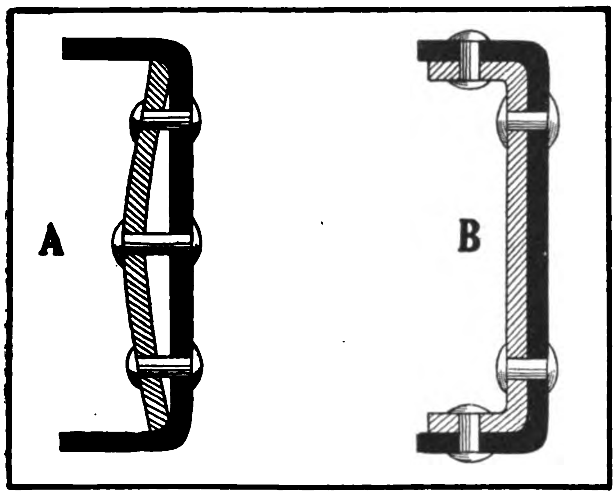
CORRESPONDENCE ON MECHANICAL SUBJECTS.

Strengthening Frame Members.

(58)—I have a weak spot in one of the side members of my automobile frame, and wish to strengthen it, as I cannot afford a new frame at this time, even if the car were worth it, which I doubt. Will you assist in this by giving me some advice on materials and methods of making such repairs? It is of the channel section, with open side in, about .125 inch thick at the point in question and is called in the catalogue "pressed steel."

J. W. DAWSON.

Bay City, Mich., April 1.



Improper and Correct Methods of Strengthening Weak Frame Side Members, Shown at A and B, Respectively.

The writer does not give any idea of where the weak spot comes in the length of the frame, or what is the duty of the member at that point. Obviously, this would be more dangerous at an engine or transmission support than elsewhere and a fracture or bend there should be strengthened with more care and the use of heavier materials than otherwise. It is necessary, therefore, in answering this query to assume a general case.

A channel section member of this character can be made stronger in one of three ways. A plate may be added outside, fitted into the inside, or both. As a fourth alternative, the piece can be broken clear through and then welded by means of the oxy-acetylene process, which does not require taking the machine apart, and would result in a stronger section than before.

Leaving aside the last method, the addition of a plate on the outside may prove unsightly, and for strength is more or less dependent upon the bolts or rivets used, being inferior in this respect to the other ways. The same objection doubtless would apply to the third method, a combination of inside and outside plates. This leaves but the second, an inside reinforcement. When properly worked out, this is the best and results in the greatest strength for the repaired section.

A sketch herewith shows two common methods, a correct and an erroneous one. The latter is that at A, where a fairly wide, flat plate, slightly greater in height than the inside distance between the upper and lower flanges of the channel, is driven into place and then bolted or riveted through. This method is wrong for two reasons; the main frame gains little strength from the plate and a small amount from the fastenings, while the mounting is such as to put into these longitudinal stresses which will break them in time without considering any external strains. In the second place, the fillet in the corners of the channel make the accurate fitting of such a plate a very tedious job, so that usually a compromise is accepted and the inner strengthening member driven in.

The repair plan outlined at B, however, is a good one. In this, a wide sheet of fairly thick metal is forged to channel shape so as to fit the inside of the frame closely; in fact, tight enough for a slight drive when assembling. It is then riveted or bolted, not only at the sides as before, but also at the top and bottom. These lend much stiffness and strength, while the positions of the holding bolts or rivets will not allow of any shifting or changing of the relations. It is not much slower to make than the former, will give considerable more strength and last many times as long. If the weak spot is not over one inch wide a 10-inch plate will do, but if the threatening zone is wider than this, it would be advisable to use greater lengths from 15 inches upward, according to the conditions.

Combination Spark and Mixture Trouble.

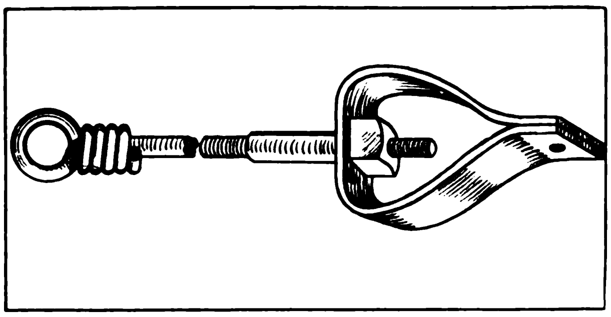
(59)—Kindly advise me concerning some puzzling troubles which I have had lately with my car. I think the fault lies in the carburetor. The car is an ——— with a ——— vaporizer and an ——— magneto. Everything works fine when the throttle is opened one-third and the vehicle running at 15 to 20 miles an hour, but in climbing a hill where the throttle lever is pulled down, the engine will not fire more than two-thirds of the time. As soon as the fuel controlling lever is put back to its former position, the motor fires regularly. If the car is run for five or 10 minutes so as to get the water heated up before starting out everything acts better. It also works much more satisfactorily at night. I have gone over the plugs and find the spark O. K. In my opinion, if this were not true, the motor would miss all of the time. I have tried every possible way of adjusting the carburetor, but this gives worse results rather than better. As soon as the adjustment is changed and the throttle opened, the engine chokes. Is the mixture too rich when it does that, and what is the remedy? Do you think that the trouble can be in the float being too high or low? What are the three different adjusting parts on the carburetor for? It may be that I do not understand these properly.

E. H. SCHOMAKER.

Newawka, Penn., March 15.

If the writer of the above letter can be absolutely certain that his ignition is right, as to quality, quantity and position, the fault lies in the auxiliary air valve. The mere fact that the spark plugs look good, and give a fair spark in the open air does not prove that they do the same within the combustion chamber where the pressure is much higher. It is often the case that an unsuspected small item in the ignition system proves very important in running the motor. If it were not that the writer above is so certain that the trouble lies within the fuel supply group, it would be suggested that the ignition be investigated more thoroughly.

From the description of the peculiar actions, it would appear that the throttle is set to give too rich a mixture when wide open. This means that the rod is connected wrong, the air valve is not adjusted right, or both.



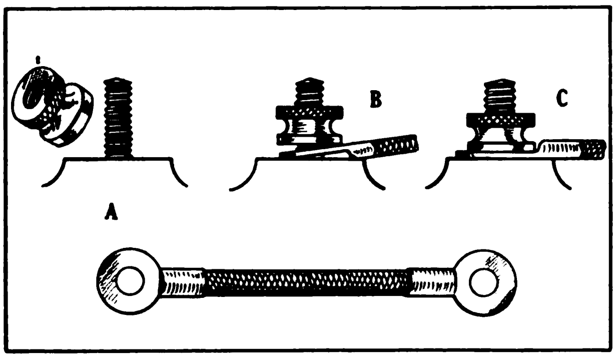
Simple Aeroplane Brace Construction Which Can Be Made from Bicycle Spoke or Piano Wire.

If the first were the case; that is, if the rod were so short that when apparently set at the "closed" position on the steering wheel the butterfly really would be only partially closed, this would result in a wide opening when the quadrant showed half of this. Finally, when the lever was moved to the extreme position indicated, the throttle actually would be closing.

Too little air results in an over-rich mixture, which will not burn as rapidly as a thinner one. Consequently this cannot be used at high speeds, and nearly all carburetors are adjusted to give a much larger quantity of air at those rates, in order to provide a mixture which will burn quickly. A good plan for adjustment is to manipulate the gasoline needle for slow speeds and the air valve for high. In carrying this out on the car, set the throttle nearly closed, and turn the needle in both directions, first one and then the other, until that is found which will permit of the slowest rate of turning over. Continue in this direction to the limit. Then lock the needle in that place.

The result of this will be that the engine will always have sufficient fuel supplied to it for the slowest possible speeds, while at higher rates, the increased suction and the necessity for a larger proportion of air will take care of itself. Then open the throttle wide, and gradually loosen the air valve spring adjustment to give the highest rate of rotation. Do not rely upon the ear in this, when it is almost satisfactory, but apply a speed counter. Turn the adjusting nut to permit more and more air to enter until the maximum speed is reached. When this has been done, lock it in position.

With a multiple carburetor, or a device with more than one standpipe, the remedy is more complicated, for there is a needle and an air valve for each nozzle. While this is more difficult in working out, the principle is the same; gasoline adjustment for slowest rotation, and air opening for highest speed.



Sketch Showing Parts of Battery Connection, Improper and Proper Methods of Using Them.

Connecting Battery Wires Correctly.

(60)—Will you please tell me about connecting terminals to dry cells. Several of us have had an argument over this matter, some claiming that there is a right and wrong method, while others say that there is no wrong method, anything being satisfactory. One claims that wire terminals are so constructed as to be fool proof, and that being the case, it is impossible to put them on incorrectly.

J. W. RILEY.

Belfast, Me., April 2.

Although wire terminals are in a sense fool proof, in that they may be put on either side up, as the accompanying sketch depicts, there is one side which should be used in preference to the other. The idea of a terminal is to make an electrical connection, and that one is best or is connected best which makes the most perfect contact.

The usual terminals have one flat side and another on which the ends are wrapped around the wire tip, thus forming the complete connector. Obviously, this must make a hump at the end of the upper surface of the tip, perhaps .125 inch in height. If this upper side be laid down on top of the battery terminal and the binding nut screwed down on it, the hump will prevent close contact. In fact, as B of the sketch shows, the terminal will bear in but two places, one on the upper surface where the nut touches it, and one on the lower side where it touches the surface of the battery.

Comparing this with C of the drawing, this being a correct connection, the difference can be seen at once. Here the terminal makes a contact all around, touching evenly on all sides, so that the electrical connection is as perfect as is possible to make it. This is the answer to the question: While there is no right and wrong way, the flat surface against the battery as in C of the accompanying sketch is the best and most economical method.

Building an Aeroplane.

(61)—I am building or preparing to construct an aeroplane and would like to have some assistance from you in the details. First, how is it that the form of rotating engine known abroad as the Gnome does not seem to have any carburetor or inlet connections to the combustion chamber?' Second, do you possess any of the dimensions of these motors, not only the bore, stroke, and power developed, but others? Third, are there many triplanes now made, and if not why? Fourth, which is the best form, monoplane, biplane or triplane? Fifth, what would be the best form to model after, my facilities for doing the work being somewhat limited as well as means? Sixth, suggest a simple and very cheap form of connection for brace wires, one that could be made at home. Any other information on aeroplane details will be very welcome.

H. G. DAVIS.

Stamford, Conn., March 16.

The Gnome engine does not have an external but an internal fuel connection, the carburetor being attached to one end of the hollow crankshaft. Through this, the fuel is drawn into the crankcase, then up through the centre of the cylinders, to the pistons. In the head of each of the latter is placed a suction inlet valve, which opens on the down-stroke, permitting the mixture to flow through into the combustion chamber, be compressed on the return or up-stroke, and then fired. A sketch on the opposite page shows the Gnome, gamma type, this being lettered according to the Greek alphabet. This has a bore and stroke of 138 by 120 mm (5.43 by 4.72 inches) and develops 70 horsepower at 1200 revolutions. There are seven cylinders, and the magneto, hidden behind the oil pump, is run at a rate of four-sevenths of the crankshaft speed.

This engine ready for use, weighs 83 kilograms (183 pounds), so its output is one horsepower for every 2.6 pounds. The fuel consumption is said to be but 270 grammes a horsepower-hour, or .085 gallon (on the basis of a gallon weighing seven pounds). This is 5.95 gallons an hour for the full power development, so that a 25-gallon tank would last but 4.2 hours.

The American-made rotating aviation motors are as follows:

Name	Cylinders	Bore	Stroke	Power
Adams-Farwell	5	6.00	6.00	72
A-M	7	3.50	3.50	35
A-M (two cycle).......	6	2.75	2.75	29
Avis (two cycle).......	2	5.50	5.00	30
Gyro	7	4.25	4.75	50
Indian	7	4.37	4.87	53
Macomber	7	4.25	4.25	50
Metz	7	3.50	3.50	34
Metz	7	4.50	4.50	57
Metz	7	6.68	6.75	126
Rotary	7	3.50	3.50	34
Rotary	7	4.25	4.25	50
Rotary	7	4.75	4.62	63
Rotary	14	4.25	4.25	101
Stenzy	2	4.00	4.00	13
Stenzy	2	4.00	5.00	13
Stenzy	4	5.00	5.00	40

Few triplanes have been built, although two new models recently have made their appearance in France. The best known construction of this type was the Roe in England, but this concern has abandoned the three-plane surface in favor of the two. Experiments along this line have not been sufficient to enable a decided opinion as to their ultimate practicability.

The biplane generally is considered as more stable in high winds, while the single surface machine has much more speed. Otherwise there is little to choose between them, although the monoplane is more simple to construct, and as a suggestion, a Bleriot type XI, two bis, might be copied.

Sketch on an accompanying page shows an excellent connection which may be made from old bicycle spokes or piano wire by bending one end and threading the other.

The bent end is wound around a circular member or spar, while the threaded portion passes through a flat plate bent to form a loop, and with one end bored to pass over a bolt, or rest between two connecting parts of the framework. Anyone can make these from strong wire, and their application is particularly simple.

Mixing Fuels and Enriching Gasoline.

(62)—Can you please tell me in what proportions do they mix ether with gasoline to enrich it and get more power from an engine when racing? (2)—Is this injurious to the engine? (3)—Is there any danger of an explosion while mixing the two? (4)—Could I by mixing gasoline and kerosene in equal proportions get satisfactory results from a ——— carburetor?

J. W. L. DE KOVEN.

Bridgeport, Conn., March 14.

It is not advisable to mix fuels, either ether with gasoline, making the latter more explosive, or kerosene with gasoline for the sake of making a cheaper fuel. The former is objectionable as both unnecessary and dangerous, while the latter serves no useful purpose either, rendering a good fuel, gasoline, useless under the usual conditions, so that the gasoline and kerosene are both actually wasted. There are better methods of utilizing cheap fuels than mixing as above.

To answer the above questions in order: (1)—Ether is an oxygen carrier, which is the reason for its use, gasoline rapidly consumed requiring an immense amount of oxygen. There is no general rule for mixing, since this practise is seldom if ever used, newspaper reports to the contrary. Tanks of pure oxygen gas are sometimes carried on racing cars and used. In this case, the sounds which the engine makes, its speed, the color and character of the exhaust, all help to determine the amount to feed into the carburetor system.

(2)—To a certain extent, ether, oxygen, picric acid and similar oxygen carriers injure the engine by subjecting bearings, cranks and all other moving parts to unusual strains for which they were not designed. In addition, picric acid is said to form a deposit on the walls, which will attack the glaze and eat into the metal. Both picric and ether would doubtless cause trouble at the valves first of all, attacking the seats.

(3)—There is no danger of spontaneous combustion or an explosion due to the act of mixing, if that is what is meant, but the higher explosive nature of the compound fuel makes it more difficult to handle, the presence of lights is more dangerous, and in many more ways, the mixture must be handled much more carefully.

(4)—Practically all of the modern carburetor makers claim that the device made by them will run on kerosene without change of adjustment. Heat is necessary in vaporizing kerosene, much more than in vaporizing gasoline. Moreover, the proportion of air to fuel is much different in the two cases, or in the third case of a mixture of equal parts of both. This would necessitate as a minimum requirement, the resetting of the air valve, the resetting of the gasoline or fuel nozzle, as well as a positive source of heat, if your model carburetor does not have a water jacket. Moreover, an engine runs differently on the two fuels. The mixing is not advisable. If you will use kerosene, use two carburetors and two tanks of fuel, one tank and one carburetor with its individual setting for each fuel.

Compression Space and Pressure.

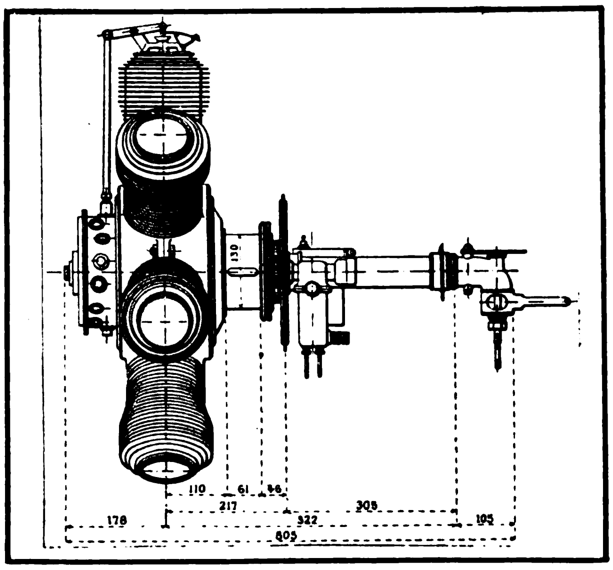
(63)—I have a question which I wish you would please answer. My engine is of four-inch bore and stroke with a 2.75-inch compression chamber, which I think too large to get the power out of the engine. Will you kindly advise the proper distance it should be from the piston head at upper dead centre? About what weight of flywheel should be used on this engine to get full power out of it?

C. I. HISCOX.

Hartford, Conn., March 28.

The information given is not sufficient to allow a definite statement as to whether the compression is correct or not, and if not how much the space should be increased or decreased to correct it. If the valves are in the head, the area of the bore times the height given would give the final space into which the charge is compressed, while this plus the volume swept out by the piston would give the total volume before compression. The ratio of the two would be the ratio of the compression and would determine the actual pressure obtained.

On the other hand, if the valves were in a pocket on one side this would add a certain volume amounting to perhaps 15 per cent. of the final volume, while if the valves were on opposite sides, a much greater amount would be added. If the cylinder head were domed, this would make the volume less in each case, as the measurement given was for the centre point.



Seven-Cylinder Gnome Rotating Aviation Engine, with Dimensions in Millimeters, Showing Carburetor Connection and Oil Pump.

The best way is to measure the amount of the space in water, so as to get it exactly. To do this, make a box which is exactly square, say either three or four inches on each side. Then, the depth of the water in this can be measured, and from it the exact volume computed. The water should be put into the cylinder and added a little bit at a time, so as not to pour in more than the right amount.

Flywheel sizes and weights vary greatly with different makers, different types of engines, different sizes of the same type, and otherwise. A small number of cylinders, as one or two, calls for heavier weight than a larger number, as four or six, while an eight-cylinder requires still less. Speaking of four-cylinder engines, about 10 pounds a horsepower are required up to 12 horsepower, 7.5 pounds from 12 to 20; five pounds from 20 to 30; four pounds from 30 to 40, and so on.

Iron or steel may be made rustproof by boiling in one gallon of water to which is added four ounces of phosphoric acid and one ounce of iron filings.

MECHANICAL POINTERS for GARAGEMEN AND OWNERS

ELIMINATING TAPPET NOISE.

There is a growing tendency to enclose the valve tappets and springs and this practise is not confined alone to the high priced automobile. This not only makes for a quiet running motor, but the life of the mechanism is lengthened considerably by being protected from the dust and dirt of the road which is attracted by the oil covered members.

While many modern motors are designed so that a removable plate may be fitted there are numerous old engines which are giving good service although the tappets are more or less noisy. At Fig. 1 is presented a suggestion for eliminating noise as well as providing protection from foreign elements.

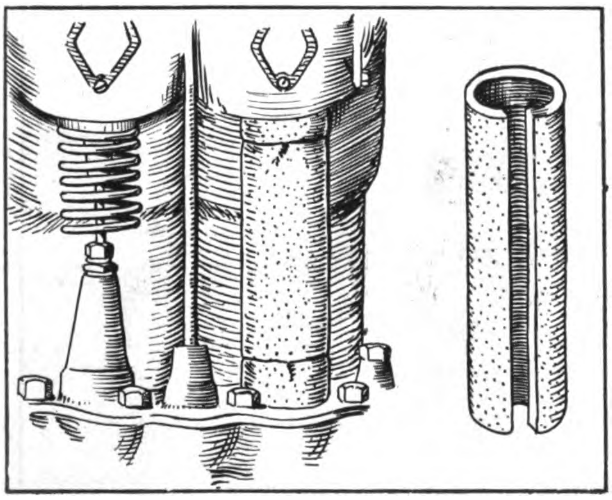


Fig. 1—Suggestion for Quieting Noisy Action of Valve Tappets.

It consists of a piece of rubber tubing fitted around the tappet and valve spring and when properly attached will reduce noisy action of the members to a minimum. With a motor such as depicted in the drawing it is an easy matter to fit the device. The tubing should be larger than the diameter of the valve spring and is cut as shown in the sketch. It is then wired or taped so the edges are drawn together tightly.

In fitting the hose, should the valve springs be larger or the same in diameter as the base of the tappet housing, this and the upper seat of the spring may be enlarged with a washer made from a smaller tubing, and a hose of greater inside dimension employed to cover the extensions. In fitting these devices care should be taken to use a heavy grade of piping with its inside diameter large enough to allow the spring to move freely and without coming in contact with the walls of the tubing.

REMEDYING LEAKY VALVE TAPPETS.

It is very unpleasant after lifting the hood to make a minor adjustment to the motor to discover that the latter is literally covered with dirty oil which has worked past the valve tappet guides and the tappets. It is even more disagreeable if the operator be not equipped with an old coat or arm protectors in the failure of which good clothes often are spoiled.

Two conditions are responsible for the presence of dirty lubricant, and these are more common with old motors or those which have been in service for some time without attention having been given to the valve operating mechanism. When a, motor is new and the rings and pistons are fitted properly there is little compression in the crankcase of the four-cycle type. In time the rings wear, especially if the lubrication system has not performed its function properly or the operator has been careless as to the quantity and quality of oil.

When these conditions exist the compression on the up-stroke of the piston leaks past the rings and pressure is created in the crankcase, the amount depending upon the fit of the rings, etc. It is obvious that even with a small amount being forced into the crankcase at every stroke of the piston, it takes but a short time for the pressure to rise and some of this must escape. If the lower half of the crankcase be fitted snugly, the oil will find its way where the resistance is the least and this may be between the valve guides and the tappets if worn, or around the end bearings of the crankshaft.

Fitting of Breather Pipes.

In modern motors provision is made for the crankcase compression by fitting breathers or standpipes. These consist of open pipes leading into the crankcase, extending vertically and being several inches in height. The top of these members, and usually more than one is fitted, is covered with a fine mesh screen to keep out foreign elements. Not only do the breathers relieve excess compression in the crankcase but they are utilized in replenishing the supply of lubricant in the crankcase and in introducing kerosene when this requires cleaning.

When the valve tappet guides and tappets are worn, and no method incorporated for relieving the compression in the crankcase, the lubricant will be forced out and it is impossible to keep the valve side of the motor clean. Even the fitting of breathers will not wholly eliminate the trouble, nor will cutting down the supply of lubricant effect a cure.

New Members Expensive.

The proper method is to replace the worn members with new parts and with a four-cylinder motor this means eight valve tappet guides and a like number of tappets, incurring considerable expense, the amount depending upon the design. The worn parts could be removed and new guides turned out, but the cost of machining and fitting in some cases probably would not warrant the expenditure.

Leaky members may be cured or conditions bettered by relieving the crankcase compression with breathers if the motor be not thus equipped. At Fig. 2 D is shown an inexpensive breather applicable to a motor, the design of which will not permit the use of a vertical member. That referred to consists of two pieces of brass piping having both ends threaded, an elbow and a cup shaped member. These may be procured at any wholesale plumbing shop and are not expensive. The inside diameter of the pipes should not be less than .375 inch, this depending upon the size of the motor, etc.

A hole is drilled in the crankcase and tapped, and the parts assembled as shown. The cup shaped member should be fitted with a screen and this may be soldered. It should screw up snugly but fit so that it may be removed easily when desired. The number of breathers will depend upon the motor. Some makers fit one large member while instances of four of these devices are noted.

Supplying Grooved Members.

At Fig. 2 is depicted several methods of remedying leaky valve tappet guides and tappets. That at A consists of cutting vertical grooves in the tappet. The object of these is to provide a passage for the oil that works up to return to the crankcase. At B is shown a circumferential groove, this being about .125 inch deep. Connecting with this are two grooves, one on either side, and these lead to the bottom of the tappet. Any oil working up will gather in the larger recess and find its way back into the crankcase. At C is outlined a method of cutting two grooves in the guide bushing and it will be noted that the top of this member is cup shaped. This gathers the superfluous lubricant which runs back into the crankcase through the two grooves in the bushing. This repair will appeal to the average motorist as the bushing is easier to cut than the tappet which is hardened and will require drawing of the temper and rehardening.

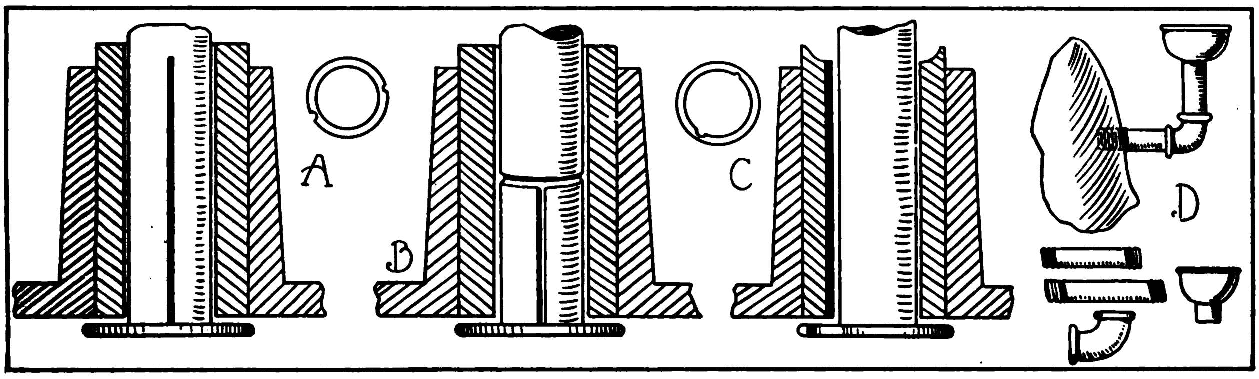

Fig. 2—Remedying Leaky Valve Tappets: A, Cutting Grooves in Tappet to Allow Oil to Return to Crankcase; B, Circumferential Recess and Grooves; C, Cupping Valve Guide Bushing and Grooving Sides; D, Home Made Breather Adaptable Where Vertical Member Cannot Be Fitted.

ANTI-FREEZING SOLUTION HINTS.

With the approach of spring the cooling system of the motor car should be given consideration. Those who have employed an anti-freezing solution of sufficient strength to take care of low temperatures will discover that the motors on mild days show signs of heating, especially if operated with a retarded spark or allowed to run idle.

This does not indicate that the cooling system is at fault. It must be remembered that denatured alcohol boils at a temperature of about 172 degrees Fahrenheit and that even when blended with water, will heat more easily than the latter alone. Many motorists are still employing a solution having 25 per cent. alcohol, but this is not necessary as it is to be doubted if the thermometer will register many degrees below the freezing point from now on.

Five per cent. of alcohol and 95 per cent. water will not freeze with temperatures higher than 25 degrees above zero Fahrenheit, and a solution of this strength will not unduly overheat the motor even when the thermometer registers well above the freezing point. If the car be exposed to the cold it is well to employ a solution of the above strength until well into April, as the nights may still be cold.

Those who have made it a practise to cover part of the radiator should remove the covering on mild days or dispense with it entirely. The fan belt should be replaced to prevent the water in the cooling system from becoming overheated. If the old anti-freezing solution has been maintained at its full strength water should be added until the hydrometer shows but five per cent. alcohol. If the solution is dirty, it is an excellent plan to throw it away and use new. The radiator should be thoroughly cleansed before using the new mixture. This may be accomplished by making a saturated solution of sal soda or common washing soda, afterwards flushing out the cooler with clean water. The motor should be run during the operation to allow the fluid to circulate freely, and the water should be changed several times.

A TIRE CHAIN HINT.

In the spring of the year when the frost is coming out of the ground one is apt to encounter mudholes, especially in the country. Even with the usual tire chains the motorist is liable to have the rear wheels sink deep in the mire and the car refuse to budge although the wheels spin. The following kink is suggested by an automobilist whose work carries him over the country roads throughout the year: If the wheels spin and become buried in the mud, remove the chains and take one member and wrap it around the tire as you would a blow-out patch. Treat the other wheel in a similar manner, and upon applying power with the low speed gear in mesh, the machine will jump out of the hole. The bunched up chain provides traction not possible with the member fitted in the usual manner.

TIGHTENING HUB CAPS.

Occasionally hub caps are lost through carelessness in replacing these members after lubricant has been applied. While they should be set up snugly, undue force should not be used as the threads of the brass member may become stripped. An excellent plan is to screw the caps up tightly then tap the wrench a light blow with the hammer. Sometimes too much lubricant is utilized and when tightening up the cap the grease gives one the impression the cap is snug. Under these conditions the cap will loosen.

DOUBLE CURING OF TIRES.

"Although the term 'double curing of tires' is mystifying to the average motorist, it is perfectly simple," says L. C. Rockhill of the Goodyear Tire & Rubber Company, Akron, O. "The Goodyear No-rim-cut tire passes through a long process between the time it leaves the factories until ready for shipment. Before it is cured the rubber is soft and plastic. It becomes more so when subjected to the steam heat of the curing process.

"The first step is the tire mold. This is continued just long enough to give the tire its shape and to insure that the layer of fabric and the gum of the carcass have been cemented thoroughly. Then the shoe is taken out of the mold and inspected carefully. This mid-cure examination makes it possible to detect 'duck pinches,' unsuspected accidental folds in the fabric, or any other imperfection that might creep in during this step of the process.

"The surface of the shoe is then roughened and the heavy rubber tread attached. When this is in position an air bag is placed inside the carcass and the tire wrapped firmly in a long strip of damp muslin. Then the air bag is inflated so that the tire, in the final cure, will take exactly the shape it will have when in use. By this method the possibility of unbalanced strains is eliminated."

CARE OF MAGNETO PLUGS.

Owing to the intense spark provided by the magneto the plugs should be removed occasionally and examined for satisfactory results. Unlike the ordinary plug, current for which is furnished by a battery, the magneto plug operates best with a small gap. This should be about .015625 inch, but it may be increased in time by the action of the heat. Sometimes erratic running of the motor at low speeds is due to irregular spark plug gaps. They should be uniform.

HOME MADE WORK BENCH.

Many owners garage their machines upon the premises and the average building is constructed to house one automobile and leave room enough to work around the machine. There is more or less minor work necessary, even if the owner does not attend to his own repairs.

Under these conditions and even where more extensive work is done the garage should include a work bench fitted with a vise. This combination will lighten labors wonderfully as well as facilitate the work. In addition the tools are kept in their proper place, being handy when needed and economy is effected as their cutting edges are not damaged as is very likely to occur when they are laid around promiscuously, one on top of another, in various parts of the garage.

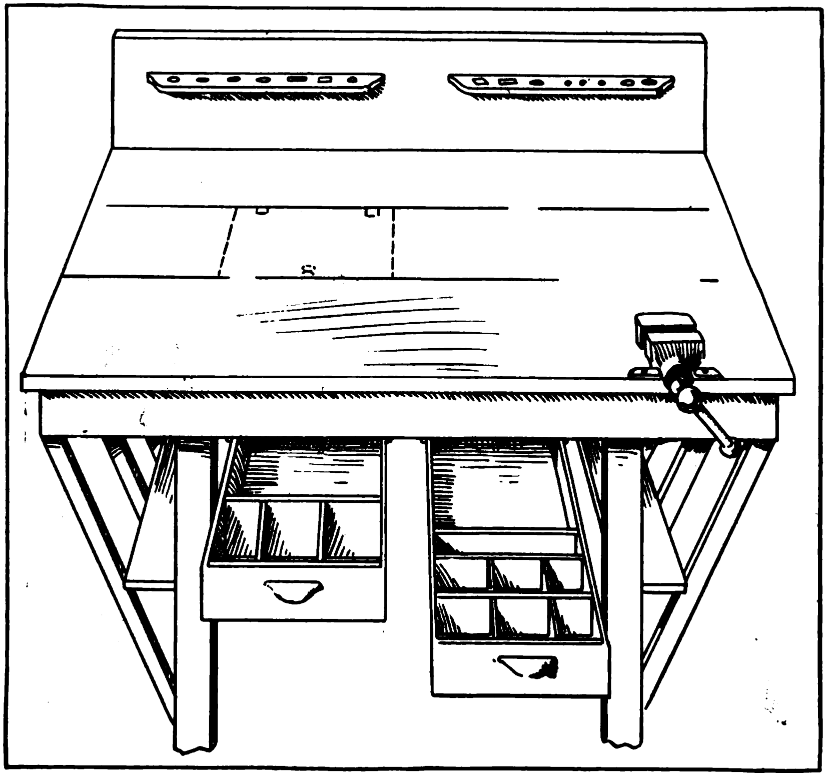

Fig. 3—Plan of Home Made Work Bench Which Provides for Shelves and Drawers, a Valuable Addition to the Equipment of the Private Garage.

A substantial work bench may be constructed at little expense if one can handle a saw, hammer and trysquare, and the design may be elaborate or simple, according to the tastes of the motorist. At Fig. 3 is presented a bench which will answer all requirements. It will be noted that provision is made for drawers and that in addition to the bench proper a lower shelf is included.

The dimensions of the design illustrated provide for a bench five feet in length, two in width and about two feet 10 inches high. The latter dimension may be increased or decreased according to the height of the user. It is not a good plan to build the bench so low that one will have to bend over in working. The height given is about the average.

The lower shelf is approximately three feet long and two wide. The side members are about nine inches wide and two feet long. It will be noted that the bench proper is fitted at the back with a vertical extension and that provision is made for the tools. Two strips are made of wood and these bored to take screw drivers, files, pliers, scrapers, etc. If one wishes to lock up the tools a section of the bench may be cut out and hinges and a lock fitted, the tool racks being attached on the inside, as outlined in the drawing.

The lumber used may be planed or unfinished stock, according to tastes of the owner. The planed material costs slightly more, but presents a neater appearance. The legs of the bench should be constructed of square joists and the bench proper of material at least two inches thick. The latter should be free from knots, and the planks nailed securely to prevent warping. The drawers may be made of whitewood, but they should be sturdy as in time considerable heavy material will be placed in them.

The trays should be divided into several compartments in which the nuts, bolts, cotter pins, etc., should be separated. It is surprising to note the number of motorists and even repairmen, who jumble these parts together and when a nut or bolt is wanted, lose considerable time in searching for the desired article.

In the overhaul work the bench will prove useful for the various small parts may be stored on the lower shelves while the ample size of the bench proper will accommodate the cylinders and other parts removed for cleaning and attention.

A SEARCHLIGHT SUGGESTION.

Searchlights of the dash type are favored by some motorists as these lamps may be adjusted instantly and without the operator leaving the seat. They are at a disadvantage, however, when the use of the storm curtain is desired. Following is a method adopted by an automobilist who drives considerably at night, and who also uses the storm curtain for protection against the wind:

A hole slightly larger than the diameter of the lamp was cut in the celluloid and the edges of the latter bound with leather. The front of the light projected through the opening, which was large enough to allow the lamp to be moved as desired. At the right of this was cut another opening for use during stormy weather.

SLIPPING CAM CAUSED TROUBLE.

Where cams are not integral with the shaft and are driven on and fastened with a pin, it is rare that trouble ever is experienced. An exception, however, was noted in a machine, which came into the garage on three cylinders. The owner was an experienced motorist and confided to the repairman that he had been over the ignition system, valves, tappets, etc., but had given up the problem. The workman after trying the usual methods, began testing the compression with one petcock open at a time.

It was found that one cylinder apparently had two compression strokes in the usual cycle; two turns of the crankshaft. This puzzled the operator for some time, but it finally was noticed accidentally that both the intake and exhaust valves on the cylinder opened at about the same period. The crankcase was removed and it was found that one of the pins holding the cam had sheared and allowed the latter to turn very gradually on its seat. In moving it had abraded the shaft somewhat and finally jammed into an incorrect position, causing the exhaust to open with the intake. The owner complained that there had been a gradual falling off of power and this, no doubt, began when the part became loose and started to shift.

NAPHTHALENE AS A FUEL.

That naphthalene is valuable as a fuel for internal combustion motors has been proved by the experiments of Chardon and Lion, with a 45 horsepower commercial car towing another truck, the total useful load being eight tons. The material was melted during the first 12 minutes run, during which gasoline was employed. The solid ingredient was introduced into the carburetor at a temperature of 176 degrees Fahrenheit, together with air treated by the escaping gases. The latter had no appreciable odor or color when the lubricant was not excessive. About 20 pounds of naphthalene an hour was consumed. It was crystallized in pieces about the size of a chestnut and contained less than .5 per cent. impurities. From observations made in the course of these trials, it appears that the material increases the effect of the lubricants. The cost of running was figured at one-third to two-thirds cent a ton-mile. The Gasmotorenfabrik Deutz uses naphthalene in briquettes. These are placed in a reservoir surrounded by pipes through which flows water heated to a boiling point by the escaping gases. The carburetor is also heated. The engine is started with gasoline and this used until the water boils, which occurs in about half an hour.

A SPARK PLUG HINT.

When new cars are being broken in and tuned up it is customary to use excess oil and sometimes this fouls the plugs and continues to do so until the feed is cut down to normal. In some types of machines the lubricant works up past the piston rings which necessitates frequent cleaning of the ignition points. If the plugs are of the long nosed design, the trouble may be overcome by threading two or three ordinary spark plug washers on each member in place of the standard single device. This brings the electrodes higher up in the cylinder and less oil is deposited.

FITTING FENDER BRACES.

Vibration has a deteriorating effect upon sheet metal if the material be not fastened securely, such as with fenders of the motor car. At Fig. 4 is illustrated a device fitted by a motorist to prevent the fenders from vibrating. It consists of two braces, one on either side, made of .3125-inch round rods. These were made in two pieces and threaded at both ends. A turnbuckle was utilized to connect the sections and for adjustment. One end of the rod was passed through the fender and secured by a locking nut while the other extremity was similarly attached to the radiator.

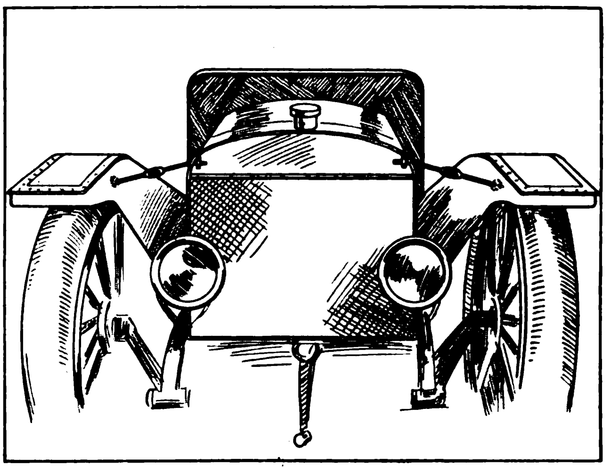

Fig. 4—Easily Constructed and Fitted Device for Bracing and Preventing Fenders from Rattling.

IMPROVING ACETYLENE LAMPS.

Owing to the spaces provided to carry off the heat in gas lamps more or less dust and dirt finds its way into the members and after long service the black paint becomes shiny, especially if it be cleaned frequently with a stiff cloth. This paint is utilized to absorb certain rays of light and may be renewed easily by using a dead black.

THE INDUSTRY AND THE TRADE.

New Electric Car from Chicago---California Tire Concern Completes Factory---Body Maker Increases Capital---Goodyear Company Issues Stock Dividend---Other Interesting Items of News Gathered from All Sections.

The Chicago Electric Car Company has been formed in Chicago, and is stated to have millions behind it. Chicago electrics will be made in a plant which has been secured at 35th and Morgan streets, and the new car is described as being shaft driven, with a wheelbase of 96 inches. Bodies will be of aluminum, and of three, four and five-passenger capacity. A new Westinghouse motor of exceptional lightness and strength will be used. F. J. Newman, formerly with the Woods Motor Vehicle Company, is president of the new concern, A. J. Leopold is secretary, and Albert Meyer treasurer. The engineer will be C. J. Blakeslee, who was with the Woods organization for some time.

The Savage Tire Company, which was organized some little time ago, has about completed its factory buildings in San Diego, Cal., and the machinery has been ordered. Although no definite announcement has been made concerning its plans, it is understood that a punctureless tire will be produced. The personnel of the company is such as to awaken interest in the enterprise. A. W. Savage of the Savage Arms Company is president; J. B. and Claus Spreckles, interested in the sugar industry, are vice president and secretary, respectively, and W. P. Bock is treasurer.

The Racine Manufacturing Company, Racine, Wis., maker of bodies, tops, etc., was recently reorganized and the capital stock increased to $800,000. F. K. Bull was elected president, and will take an active part in the affairs of the company with the assistance of J. W. Gilson, the vice president, who was formerly with the Hartford Rubber Works and later with the Mitchell-Lewis Motor Company. The other officers are: Treasurer, G. W. Jagers; secretary, Harold Smith.

The San Francisco branch of the Studebaker Corporation is to separate shortly into two parts, one handling automobiles alone, and the other the horse vehicles made by the Studebaker concern. Heretofore, both the products have been handled by the one branch, the Studebaker Bros. Company of California, under the management of Chester N. Weaver. He will take charge of the new concern which is to be organized as the Studebaker Corporation of America, for the sale of the Studebaker automobiles in California. The old company will continue to handle the wagon interests and will be placed in charge of L. F. Weaver, manager of the branch in Portland, Ore.

The Detroit Automobile Dealers' Association held its annual election recently, with all the 26 members present. W. F. V. Neumann was elected president, succeeding George Grant. The other officers were elected as follows: Vice president, H. D. Moran; secretary, Joseph Schulte; treasurer, C. C. Starkweather.

Mark Merriman, vice president of the Hayes Wheel Company of Jackson, Mich., has purchased a plant in Albion, Mich., where he will produce wheels and wheel parts, confining himself more particularly to the latter.

The Kelly-Racine Rubber Company, Racine, Wis., has added $150,000 to its capital in order to allow for the expansion which a rapidly increasing business has made necessary. The annual output is given as $1,200,000, which is a good showing, considering that the company has only been in existence two years.

The Goodyear Tire & Rubber Company, Akron, O., is to distribute a stock dividend of 100 per cent. This will be made possible by the increase of the capital stock from $6,000,000 to $15,000,000.

The Day Automobile Company, Detroit, has leased a factory at 25 East Milwaukee avenue. The building is two stories high, and gives the maker of the Day utility car 20,000 square feet of floor space.

Dealers and garage men in Racine, Wis., are planning to organize an association for mutual protection and the advancement of trade. One of the objects will be to eliminate the man who obtains an agency solely for the purpose of getting a car for himself at a low price and interferes with agents who actually try to sell cars. Good roads also will be promoted.

The Warner Instrument Company, Beloit, Wis., maker of Warner Auto-Meters, is to erect an addition to its large plant. The new structure will be of concrete and brick, 100 by 100 feet.

The Scheidel-Thompson Manufacturing Company is to begin operations in the Industrial building, Indianapolis, Ind., about June 1. Sheet metal parts, such as hoods, fenders, tanks, tool boxes, etc., will be made.

Chester S. Ricker, who has been prominent in the trade press, has become mechanical engineer and designer for the Henderson Motor Car Company, Indianapolis, Ind.

A. L. Tisch has succeeded A. A. Franklin as advertising manager of the Haynes Automobile Company, Kokomo, Ind. Mr. Tisch comes from New York, and as he has had actual mechanical experience as well as advertising training, he will be a valuable acquisition for the Haynes forces.

The Sigmund Auto Truck Company has been organized in Milwaukee, Wis., and will make a motor truck. The capital is $50,000, and the firm is composed of N. W. and B. P. Marx, and Jesse L. Stroede.

The Duplex Coil Company has decided to remain in Fond du Lac, Wis., sufficient inducements having been made by local business men to cause it to give up the plan of moving to Bay City, Mich.

The Waukesha Motor Company, Waukesha, Wis., is publishing a new house organ under the editorship of H. L. Horning. It is called Power and Efficiency, and is designed to appeal to manufacturers, sellers and users of motor vehicles.

The Punctureless Tire Company, maker of the Dahl tire filler, has moved to new quarters at 1323 Michigan avenue, Chicago, which affords 25,000 square feet of floor space.

It is rumored that the J. I. Case Threshing Machine Company of Racine, intends to spend $1,000,000 on a new plant which it is constructing near its present works.

The Henry Manufacturing Company, maker of the Blitzen self-starter, has opened a branch in Chicago at 1120 Michigan avenue, which is in charge of Frank S. Murray.

The Cole Automobile Company is the new name of the San Diego, Cal., agent for the Cole, made by the Cole Motor Car Company, Indianapolis, Ind. The concern was formerly known as the Bowler Motor Car Company. It is erecting a new salesroom and service station, and will shortly have a modern establishment in which to care for its rapidly increasing business.

Portland, Ore., dealers have been changing locations recently. The Portland Motor Company has moved to a new home at 23rd and Washington streets; the Becker Automobile Company is now located at 14th and Everett streets; while the United Auto Company is occupying a new salesroom at 16th and Alder streets.

Ralph W. Keeler has been appointed general manager of the Miller Car Company, recently organized. The Miller car will be made in Detroit.

E. E. McCleish has resigned as advertising manager of the Paige-Detroit Motor Car Company, Detroit, in order to accept a similar position with the Airlane Motor Company.

F. G. W. Sudrow has been made sales manager of the Apple Electric Company, Dayton, O. He has been succeeded in the management of the Detroit branch by H. J. Shire.

A. B. Brakman has been placed in charge of the United States Motor Company's interests on the coast, and will have charge of branches in Los Angeles and San Francisco.

A. J. Rogers, who has been connected with the sales department of the Remy Electric Company, Anderson, Ind., has been appointed manager of the Remy magneto branch and service station in San Francisco.

The Warren Motor Car Company, Detroit, has doubled its capital, having added $300,000 to the original stock.

Morgan & Wright, Detroit, a constituent of the United States Tire Company, New York City, has secured the Oldsmobile plant in which the famous curved dash runabouts were made, and will use it as an addition to the already big Morgan & Wright tire factory.

J. A. Boyle has been elected vice president of the Briscoe Manufacturing Company, Detroit. He will still retain the office and duties of general manager. J. A. Holihan has been promoted to become assistant general manager.

The Briggs Manufacturing Company, Detroit, maker of the Detroiter car, has started the construction of a new factory at Denton avenue and the Grand Trunk Railroad.

Charles W. Garratt has become secretary and treasurer of the Federal Motor Truck Company, Detroit, maker of Federal commercial vehicles. He was previously connected with a steam radiator and heating concern.

The Diamond Rubber Company, Akron, O., is erecting a new building which when finished will be one of the company's largest factories. It will be six stories high, and 275 feet long, and it will be used for the manufacture of tires.

The Willard Storage Battery Company, Cleveland, O., has moved its offices to 5716 Euclid avenue, and has started work on an addition to the factory which will afford 25,000 square feet of much needed space.

The Lauth-Juergens Motor Car Company, Fremont, O., is erecting an addition to its factory, which when completed will enable it to double the output of Lauth-Juergen trucks.

The Saxon Manufacturing Company, which was organized in Toledo, O., some months ago, following the failure of the Saxon Lamp Company, has leased a five-story factory in Toledo, and will take possession early in the summer.

Hartford, Conn., motorists will have to pay higher garage storage rates, six of the principal garages having agreed to raise their rates. The new figures run from $15 a month for open cars of 112-inch wheelbase to $25 a month for limousines. This includes washing and polishing service.

The Portland, Me., dealers have organized the Portland Automobile Dealers' Association, and intend to conduct a reliability run. A show is also planned and the association is considering the erecting of a building for the purpose, if no suitable structure can be obtained.

The chauffeurs employed by the city of Boston are to take a course on gasoline motors at the Franklin Union for eight weeks. Three lectures a week will be given, and those who show special aptitude for the work and obtain a certificate from the Union, will receive an increase in salary from the city.

The Pittsfield Spark Coil Company, Dalton, Mass., has been reorganized, the capital being increased from $100,000 to $250,000. L. B. Hopkins, formerly with the General Electric Company, has become treasurer, and H. Allen, formerly with the Simms Magneto Company, is the new manufacturing superintendent.

Woodworth treads are to invade Europe, A. Hedinger, formerly Boston manager of the Leather Tire Goods Company, Niagara Falls, N. Y., having sailed for the other side, where he will have the Continent as his territory in appointing agents.

Leslie R. Pratt has leased the factory at 1717 Eighth avenue, Brooklyn, N. Y., from the Cooper Diamond Company, and will use it for the manufacture of rubber tires.

The Kline Motor Car Company, Pittsburg, Penn., is to erect a building at a cost of $30,000, to contain salesrooms, garage and repair shop, as well as a touring information bureau.

Cram & Sovereign, Geneva, N. Y., reports that it has a 1500-pound motor truck almost ready for the market. It will embody a number of desirable features.

New Orleans, La., is to use automobiles in collecting the mails. The postoffice department has authorized the use of motor trucks in handling mail to and from the stations and docks.

The Dyneto Electric Company has outgrown its factory in Elbridge, N. Y., and is to move to a larger plant in Syracuse.

The Empire Automobile Company, now operating a factory in Greenville, Penn., is to have three factories in as many cities, according to the plan announced recently. A second factory will be built in Indiana, in either Knightstown or Indianapolis, and Missouri will get the third factory, in either Kansas City or St. Joseph.

The St. Paul Rim & Axle Company, which is capitalized for $100,000, is reported as looking for a factory site in St. Paul, Minn., in the Midway district. The manufacture of a new arrangement by means of which tires may be demounted with the present rims is contemplated, and drop forging will also be undertaken.

The Council Bluffs Auto Starter Company has been organized in Council Bluffs, and will manufacture a starter invented by H. L. Meeder.

P. E. Zimmerman has been appointed general manager of the Hagstrom Bros. Manufacturing Company, Lindsborg, Kan., after having been in charge of the advertising end of the business for some time.

The Motor Specialties Company, Waltham, Mass., is shortly to move into a larger factory, having secured building No. 1 of the Waltham Gas Company's plant. The concern makes a variety of accessories, including spark plugs, timers, distributors, gas lighters and jacks, and the business in these has increased so as to make larger quarters necessary.

The Wenonah Motor Truck Company, Bay City, Mich., is to be incorporated to manufacture motor trucks of 1000 to 1500 pounds capacity. A. B. Perkins is president of the new company, which will consist of himself, his three sons, and G. E. Porter.

Harry H. Elmer, formerly with the Haynes Automobile Company, has joined the Grant-Lees Machine Company, Cleveland, O., as vice president, general manager and director. He will take charge of the designing and building of a new six-cylinder car, the Grant-Six, which is to appear shortly. A modern plant is now under the course of construction in which the new car will be built.

R. S. Bryant has been appointed consulting engineer of the Standard Welding Company, Cleveland, O., and will keep an eye on the production of the company's automobile rims and other parts. He was previously connected with the Bryant Rim Company in Columbus, O.

Charles Y. Knight, the inventor of the well known sliding sleeve engine which bears his name, is planning to issue a monthly magazine devoted to his invention. It will be published at Coventry, England, where Mr. Knight now resides, and where the Daimler works are located.

The United States Tire Company, New York City, has issued an interesting little booklet entitled "How I Became 'Tire-ly Satisfied," covering the conversion of a motorist to the United States brand of tires.

W. E. Flanders is said to be interested in a new six-cylinder car for which W. H. Cameron, formerly designer and engineer for the Overland Motor Car Company, now the Willys-Overland Company, is responsible. It is understood that the new car will be placed on the market in the near future from the plant of the Universal Motor Truck Company, Detroit.

C. F. Splitdorf, New York City, is numbered among the accessory makers who have established service stations for the convenience of their patrons. Splitdorf service stations are now located in New York, Boston, Detroit, Chicago, Kansas City, San Francisco and Los Angeles. Others are to be opened in the near future.

The Lynn Automobile Dealers' Association, Lynn, Mass., has decided that second hand cars will no longer be accepted as part payment on new machines. Cut rates on accessories are under advisement, and the association hopes to do away with these as well.

The K-W Ignition Company, Cleveland, O., is distributing what is probably one of the most complete catalogues of electrical automobile apparatus that has appeared. The book has 64 pages, and five of them are devoted to instructions for fitting the K-W lighting magneto to cars not already equipped with magnetos.

A. E. Beharrell is now associated with the Velie Boston branch, having left the Velie agency in Lowell, Mass.

At a recent meeting of the board of directors of the United States Motor Company, New York City, L. E. Latta, who has been with the company since its organization, was elected secretary. He was formerly secretary of the Maxwell-Briscoe Motor Company. F. D. Dorman has resigned from the United States Motor Company to become president of the Steinbock Engineering Company, which was recently organized to make moderate priced cars.

Herbert Lytle, the veteran race driver, is now manager of the Indianapolis branch of the Apperson Bros. Automobile Company, Kokomo, Ind.

E. B. Cartwright, Haverhill, Mass., recently drove his car equipped with Ajax tires over a total distance of 7000 miles without a puncture or blow-out.

A new electric model is being produced by the Flanders Manufacturing Company, Detroit. It has a battery of 30 cells, distributed 20 in front and 10 in the rear and larger motor and a better controller mounted on top of the steering column. The body design is colonial, on the style of a previous model. The wheelbase has been lengthened three inches.

MISSOURI'S CENSUS FIGURES.

While Missouri may not be classed as one of the most important automobile producing centres of the country, the report of the census bureau with reference to its findings during the 13th census shows that the number of factories in the state producing automobiles, bodies and parts, increased from three in 1904 to 17 in 1909. The total value of products increased from $63,000 to $1,677,000 during the same period. The statistics for the state and the city of St. Louis follow:

State of Missouri.

	1904	1909
Number of establishments	3	17
Persons engaged	37	449
Proprietors	3	6
Salaried employees	13	75
Wage earners	21	368
Primary horsepower	20	184
Capital involved	$24,000	$800,000
Salaries paid	5,000	85,000
Wages paid	16,000	252,000
Cost of materials	31,000	1,025,000
Value of products	63,000	1,677,000
Value added by manufacture	32,000	652,000

City of St. Louis.

	1904	1909
Number of establishments	3	11
Persons engaged	37	340
Proprietors	3	2
Salaried employees	13	56
Wage earners	21	282
Primary horsepower	..	139
Capital involved	$24,000	$620,000
Salaries paid	5,000	62,000
Wages paid	16,000	197,000
Cost of materials	31,000	727,000
Value of products	63,000	1,302,000
Value added by manufacture	32,000	575,000

FIRE EXTINGUISHER.

An excellent fire extinguisher for the garage is said to be an ordinary syphon of soda, as it is claimed that the fluid is very effective in quenching burning gasoline, the carbonic acid gas being non-combustible.

Patching Blow Out Holes—When a hole in a shoe is to be patched, particularly one made by a blow out, the rubber is first hung over a block form, and the material cut clear through to the fabric. This is done all around the shoe, including the bead if a thorough repair is to be made. The surface should then be buffed, ground or sand papered down to an even and regular smoothness, after which the building up or stepping process may proceed.

INDUSTRY APPROVES TRADE FACT EXCHANGE.

Unqualified Indorsement of Service That Means General Promotion of the Interests of All Concerns Constituting the Market of the Nation.

The Trade Information Exchange established in connection with the publication of the Accessory and Garage Journal has been approved by the industry and the trade unqualifiedly. The Exchange places at the disposal of any individual or firm the information in its files and library and it will supply any fact that may be desired and is procurable. There is no limitation to the number of inquiries that may be made. The larger the demands made upon it the better will it serve its subscribers, and as the service continues it will no doubt be improved, because the facts available will be augmented and arranged to minimize time and correspondence.

The Exchange is free to all concerns listed in the Buyers' Guide published in The Automobile Journal, the Motor Truck and the Accessory and Garage Journal, and to all automobile dealers, accessory and supply dealers, garage and public service station owners and managers, and repairers, who are regular subscribers to the Accessory and Garage Journal. The Exchange is not free to manufacturers and selling agents for manufacturers not listed in the Buyers' Guide of the three publications named.

The relations of the Exchange are confidential. Through it the man who desires any information may obtain it without loss of time, with a minimum of correspondence and from every trade interest from whom he seeks facts that will be promotive of his own business and stimulative of the entire market. It conveniences the trade because it affords to the inquirer all the detail that relates to the products of the industry he desires information of. It places the manufacturer and the selling agent at parity so far as establishing relations is concerned, and it opens to all alike associations that could not be created save through personal solicitation and material expense.

There is no advantage for the one as compared with the other negotiations through the Exchange. All receive the same degree of attention and merit of production is the one element that should influence all whatever transactions are consummated. The business man who has need of any fact can obtain it at no other trouble than writing an inquiry and mailing his letter. He then has all the resources of the Exchange and he can obtain from a single query not only the detail of any given production, but he can ascertain the selling propositions of all those who manufacture this line.

There is no restriction as to the section of the market under consideration. The service applies equally well to any town, city, state or part of the country. It permits the trade a selection of any article from the whole of the industries and there is no influence other than actual merit entering into the transactions that may be considered or determined. There is no possibility of misunderstanding or embarrassment of any interest. The confidential nature of the Exchange is such that there can be no advantage in matter of distance because the inquirer, having a choice, will not close a contract or connection until he has received the replies from those of whom information was sought.

It is obvious that promptness by the Exchange and by those entering into negotiation is absolutely essential for the realization of the fullest benefits. It is not practical nor reasonable to believe that delays can be tolerated, but it is always possible in the event of inability to make reply to an inquiry to send a letter of advice stating the fact and when a complete statement can be made. This is not stated as a mere courtesy, but as a condition that should be carefully observed by those who are at any time in communication. There can be no responsibility assumed by the Exchange for failure to act promptly, and that there may be no uncertainty an accurate record is kept of the time of receipt of all mail, as well as the time of the dispatch of all sent out.

It may be understood because of the volume of business conducted by the Exchange that it is necessary to have the records as simple as is possible and maintain the completeness essential. The use of forms is imperative and it is not possible to afford the character of service desired unless those who shall benefit through it co-operate, if manufacturers and selling agents, in supplying the latest file of printed or other information, and supplementing this from time to time as amended, revised or added to. In fact not a little depends upon the quality of the matter filed.

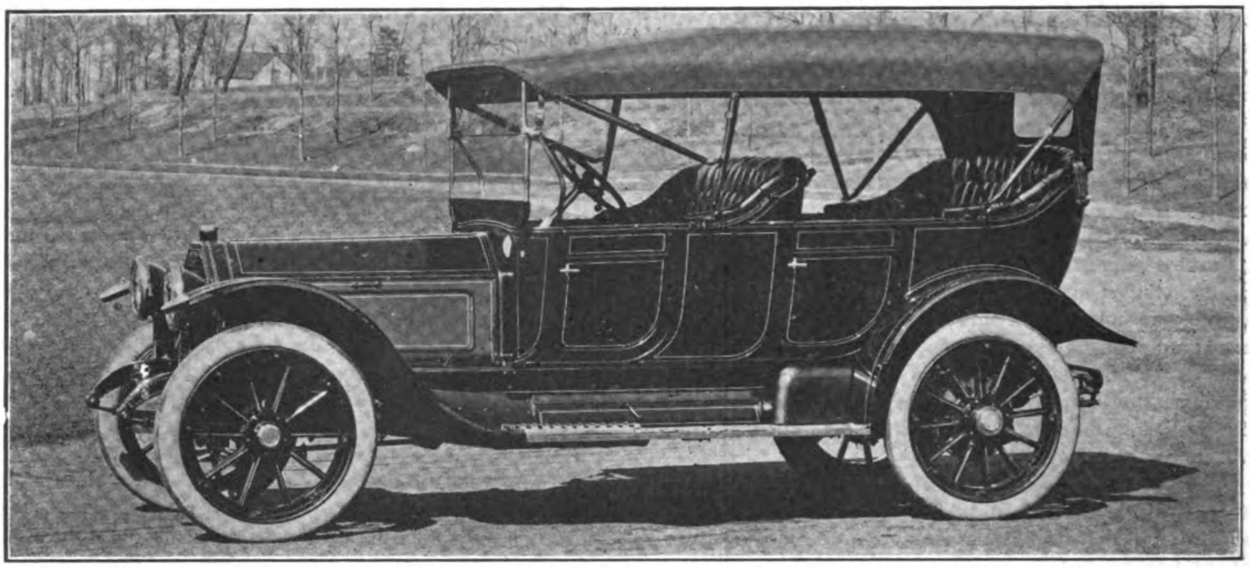
When the Exchange has received, transmitted and exchanged all facts and correspondence with any given inquiry its responsibility as an intermediary ceases. It cannot guarantee that there will be a positive result in negotiations but it will have afforded to all concerned its entire facilities for promotion and for general business advancement.

REMOVING STUBBORN NUT.

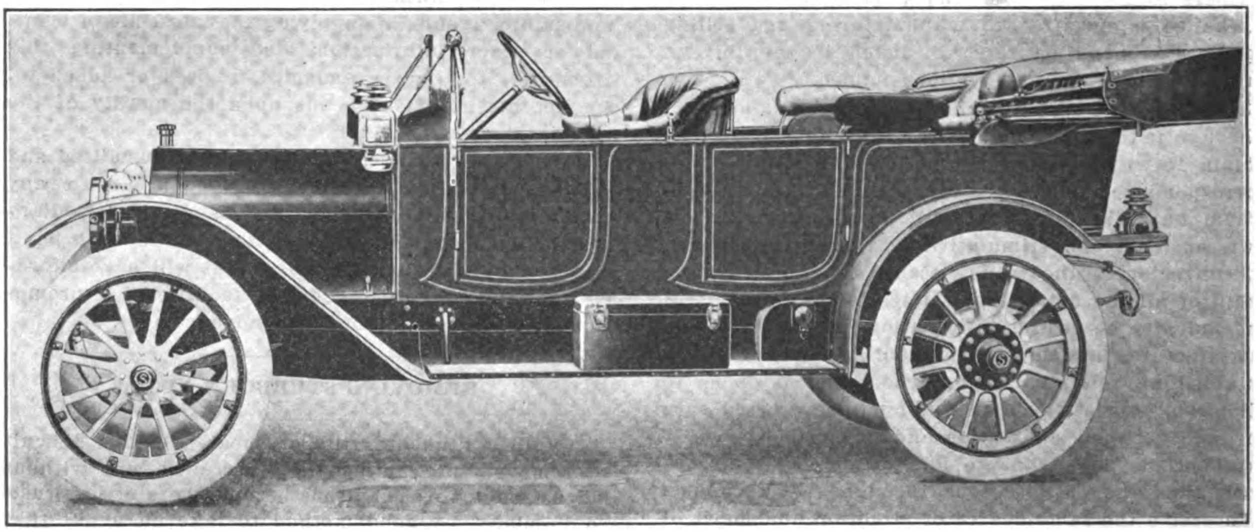
While a stubborn stud or sheared bolt is difficult to remove, one can usually unscrew a nut without much trouble, even if it has become more or less rusted in place. A good method to take off a nut that seems to resist being parted from its stud or bolt more than usual is to heat an open spanner that fits the nut and let it rest against the nut for a few minutes. The heat will expand the nut without producing corresponding expansion of the bolt and it may be unscrewed easily. The spanner or end wrench may be heated in a blow lamp flame, and while this kink is very old it is not generally known. One should not heat a hardened wrench or an adjustable member as it may be rendered unfit for use. The blow lamp flame should not be applied to the nut direct because the bolt will be heated and will expand as well as the nut. Kerosene may be poured around the threads with good results, especially if the nut has rusted in place. Several alternate heatings and applications of oil may be needed before the nut is loosened, and if it still resists, a light tapping with a hammer on all the facets while it is hot may assist in having it become looser on the threads.

To whiten a surface for laying out work, mix whiting with gasoline to the consistency of paint, and cover the surface to be marked. The gasoline will soon evaporate, leaving a white surface on which lines can be easily scribed.

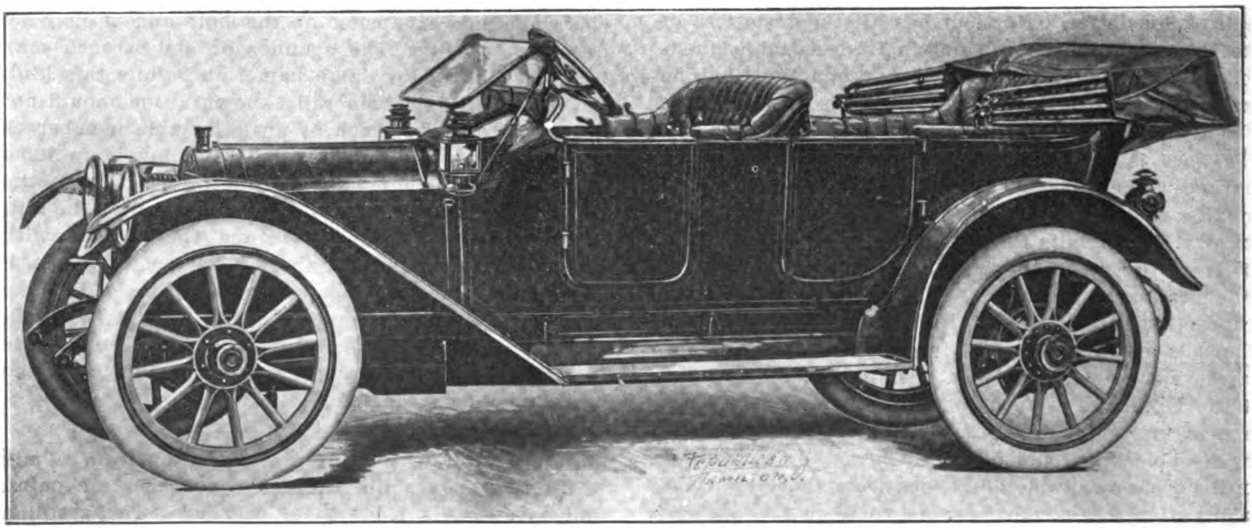
ATTRACTIVE LINES FOR LIVE AGENTS.



The Peerless "38-Six" Touring Car, 1913 Model, Made by the Peerless Motor Car Company, Cleveland, O.—Price $4200.



Selden 1912 Model 47 S, Seven-Passenger Touring Car, Made by the Selden Motor Vehicle Company, Rochester, N. Y. —Price $2600.



The Standard Republic Five-Passenger Touring Car, Manufactured by the Republic Motor Car Company, Hamilton, O. —Price $2250.

VALUE OF BUYERS' GUIDE TO THE TRADE.

A Record of Known and Reliable Business Houses, Revised 48 Times the Year Contrasted with the Indiscriminate Listings of General Directories.

A trade directory is distinctly a reference. Its value to the buyer is in the accuracy of its information. Its worth to the concern listed is gauged by the care in compilation and the frequency of revision. Commercial data as ordinarily compiled is with each enterprise of record grouped under its appropriate classification. These lists are published four times a year at the most and are circulated to those who are sufficiently interested to purchase them. Naturally the distribution is limited and the expense is considerable. Aside from active manufacturing interests few are purchased. These directories are general and are not as a rule devoted to any particular industry. Neither are they confined to any special group of industries. They are not public conveniences and are serviceable only to the subscriber.

In these lists all trade interests are given like prominence. The firms that have the highest business reputation and standing are rated at parity with others that may be little known and of doubtful repute. The buyer may be brought into relations with the unreliable concern solely through the fact that he assumed reliability through its apparent equal rating with others in the industry. In this respect the trade directory is a vehicle for those who are unscrupulous to pirate upon the businesses that have been long established and are deserving of confidence and patronage.

The guide for the buyer must be dependable, first of all. It must be accurate and it must be composed of firms of unquestioned reputation. It ought to specify so far as possible to differing products of each concern. Buying at long range is becoming the more and more necessary and time is a potent factor.

The Buyers' Guide published in The Automobile Journal, the Motor Truck and the Accessory and Garage Journal specifies the firms that are actual and legitimate business competitors. The classification is select from the viewpoint of the buyer and the seller. The list is complete in every sense. It directs attention to reliable business houses and inspires confidence in them because they are well and favorably known. Both the buying and the selling interests are benefited.

The Buyers' Guide appears in each issue of these three magazines. It is revised for each edition, and there are 48 distinct publications annually, which insures to those making use of it that it is correct to the day of publication. The compilation is first brought directly to the attention of the subscribers. The magazines are then preserved for reference. The trade directory may have a circulation of 5000 each edition, and four editions annually at the most. The average business guide goes to practically the same persons each issue. The Buyers' Guide is published in The Automobile Journal and reaches its 13,000 subscribers 24 issues the year, and once each month it is received by the 9000 readers of the Motor Truck, and by the nearly 12,000 who subscribe to the Accessory and Garage Journal. This totals approximately 34,000 different interests who receive the Buyers' Guide in the magazines either 12 or 24 times a year. This is from three to six times the number of editions of the best and most progressive general directory and the distribution is about 580 per cent. more.

The value of the Buyers' Guide is alike to all who receive it. The Automobile Journal is published for the benefit of the owners of automobile vehicles. More than 90 per cent. of its circulation is to this class of readers. The Motor Truck is devoted to the promotion of the mechanical wagon for highway transportation and it is read by those who are using such service or are studying haulage subjects with a view to utilization of power conveyances. The Accessory and Garage Journal is given over to the industry producing the pleasure car and the commercial transport, to those distributing them, to those selling them, to those manufacturing equipment, accessories and supplies, to the garage and public service station owners and managers, and the repairers and those who specialize maintenance work.

The Buyers' Guide is a systematically arranged classification of select firms. It is a list of reliable and dependable concerns, known through merit of production and worthy of confidence because of established reputation. It is composed of enterprises producing practically everything that may be desired in connection with the use of the automobile. The Buyers' Guide is revised for each edition and it is more complete than any other in this respect. No less than 48 revisions each year insures the most authentic information.

The Buyers' Guide is a reference instantly at the command of those desiring its facts and specific detail. It contains the precise knowledge wanted and everything not essential is eliminated. It is complete and thorough in all requirements.

Besides the qualities emphasized the Buyers' Guide is published in the editions of Standard Automobile Mechanical Handbooks. The works are the most comprehensive of their kind and are recognized authorities. They are adopted as text books in many of the largest and best known technical and mechanical schools. They go into the hands of those who use them constantly as references. As a complete library of practical worth they are preserved and the lists are always available. The distribution of these volumes will aggregate approximately a half million the present year. This places in the hands of the purchasers of these works the latest and most desirable buying information.

The combined circulation of the Buyers' Guide in the magazines, based on the distribution of April 1, is 564,000 annually, and in the handbooks the most conservative estimate of sales is a half million the present year, so that there will be approximately a million copies distributed during 1912. There is no question as to the figures stated. There is the natural increase that is not considered in the statement made.

The service of the Buyers' Guide is free to all advertisers who have yearly contract with any one of the magazines. Each firm is listed under one or more appropriate classifications. Any new production may be designated, a condition that is especially desirable with any established firm.

Useful Hints When Working Wood—When driving screws into wood with a screw driver, it is quite an advantage to use soap on the thread of the screw. Draw the screw across the bar of soap before inserting.

Oil Your Ford Motor From the Seat

The Pedersen Oiling System now in use on many of the highest priced cars is easily attached to the Ford Model "T" Cars.

Is as simple as the car itself, having only two moving parts and cannot get out of order. Oil for 250 miles with one filling, no smoking, no waste of oil.

This Oiling Outfit Complete ready to mount **$15.00.**

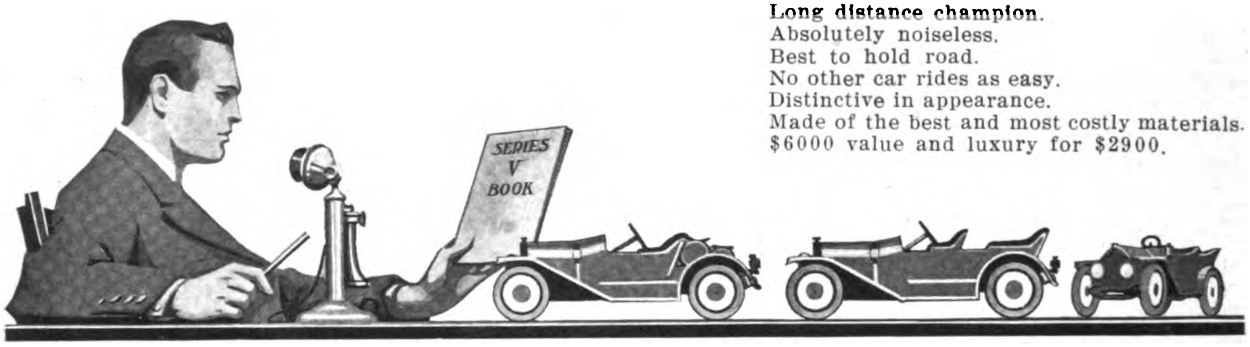
$6000 value and luxury for $2900.



Here is the Story of a Salesman's Success. Write for Our Series V Book Today. It is the 1913 Authority on Motor Cars.

THERE is no mystery about the way this Dealer analyzed the automobile situation, and with our co-operation built up a permanent profitable business. He looked around his territory; sized up the prospects; weighed his competition and then selected his car—the National. Sounds simple and almost trite? Yes, but consider that he is the most prosperous dealer in his territory; has the most satisfied patronage and his business is permanent. He avoided mistakes at the start by selecting the car of quality and correct price. He does not have to "get out from under" his car every year in order to make a fresh start. Every National owner is a National Salesman for this dealer.

The National comes nearer than any other car to being able to "select its owner." The majority of National cars sold last season were taken by discriminating people who formerly owned more expensive cars but have happily learned that the National is adequate in service as in comfort and luxury.

Dash—strength—power and distinctive appearance; this for the Man who loves a thoroughbred mount.

Easy riding—luxurious—and as easy to handle as an electric; this for the Woman who is exacting in her demands.

The National meets the requirements of both of these Buyers.

Consider the large selling radius the National enjoys. Every man who wants a car ranging in price from $1800 to $6000 is a Positive Prospect for a National. The National enjoys the highest reputation and prestige of the entire world of cars.

It is the World's Stock Champion. Everybody knows that the National is sure, safe, and powerful. It is also the criterion for comfort, luxury, ease of riding, and elegance in design and finish. With left-hand drive and center control, the National has the greatest cash value as a second-hand car. It is just a year or two ahead of other cars in design.

Write at once for Series V Book. We have a Service Department for dealers. This Department is managed by competent men of experience who will be glad to go into details with you. You will profit by writing to us at once.

Four Models—$2600 to $3000

National Motor Vehicle Co., East 1060 22d Street, Indianapolis, Indiana

Leading Concerns in the Industry

Buyers Use This Guide

Representative houses in all branches of the industry are to be found in this index. When purchasing look for names, addresses and product wanted, under proper classified heading

ACCESSORY MANUFACTURERS AND JOBBERS.

Bi-Motor Equipment Co., 177-179 Portland St., Boston, **Mass.** **Branch:** 113 Massachusetts Ave., Boston, Mass.

Boyd, F. Shirley, 903 Boylston St., Boston, Mass.

Hawthorne Mfg. Co., 29 Spruce St., Bridgeport, Conn.

Hopewell Brothers, Newton, Mass. **Branch: 1974 Broadway at 67th St., New York City.**

Miller, Chas. E., 97-103 Reade St., New York City. **Branches:** 202-204 Columbus Ave., Boston, Mass.; Bridge and Dwight Sts., Springfield, Mass.; 274 Trumbull St., Hartford, Conn.; 924 Eighth Ave., and 2782 Broadway, New York City; 1421 Bedford Ave., Brooklyn, N. Y.; 318 North Broad St., Philadelphia, Penn.; 824 Main St., Buffalo, N. Y.; 1829 Euclid Ave., Cleveland, O.; 227 Jefferson St., Detroit, Mich.; 66 Edgewood Ave., Atlanta, Ga.; 601-603 Baronne St., New Orleans, La.; 135 Central Ave., Albany, N. Y.; 274 Halsey St., Newark, N. J.

Milwaukee Auto Specialty Co., 128 Second St., Milwaukee, Wis.

Waite Auto Supply Co., 81 Exchange place, Providence, R. I.

ACETYLENE TANKS.

Prest-O-Lite Company, 271 East South St., Indianapolis, Ind. (Prest-O-Lite.)

Branches: Atlanta, Baltimore, Boston, Buffalo, Chicago, Cincinnati, Cleveland, Dallas, Denver, Detroit, Indianapolis, Jacksonville, Kansas City, Los Angeles, Milwaukee, Minneapolis, New York, Omaha, Philadelphia, Pittsburg, Providence, San Francisco, Seattle, St. Louis and St. Paul.

THE ACCESSORY —AND— GARAGE JOURNAL

Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. II. PAWTUCKET, R. I., MAY, 1912. No. 1

CHANGES INDICATE INDUSTRY'S GROWTH.

Goodrich-Diamond Merger, Splitdorf Company's Reorganization, United States Rubber Plans and Other Announcements for the Month Denote Increased Prosperity---Several Important Transactions of Unusual Interest.

THE past month brought forth several important changes in the automobile and kindred fields, one of which, the merger of the Goodrich and Diamond Tire companies, may be considered one of the largest transactions in the history of the industry. In this, the B. F. Goodrich Company bought out the Diamond Rubber Company, and it is expected that the merging of the capital and interests of the two will result in superior efficiency and economy. Another and almost equally important deal was that by which C. F. Splitdorf, Inc., was reorganized with the introduction of some of the J. F. Alvord capital.

In these important changes is to be seen an indication of how the capitalists regard the automobile field at present. Expansion is the desire of the big firms, who realize that the future before the industry is a large one, and that large facilities must be available to provide for its possibilities. The past year has been full of such consolidations and strengthenings of existing organizations, and this is a most flattering indication of a present stability and prosperity of the automobile industry.

GOODRICH-DIAMOND MERGER

Two Large Automobile Tire Concerns Amalgamate with Capital of $90,000,000.

One of the largest transactions in the history of the automobile industry is noted in the purchase of the Diamond Rubber Company of Akron, O., by the B. F. Goodrich Company of that city, involving, according to the official statement of the interested parties, the sum of $45,000,000. It would appear that the Goodrich concern is to be reorganized in a measure, the following officers and directors being proposed: Chairman of the board, F. A. Hardy, Chicago; vice chairman, F. A. Mason, Akron; president, B. G. Work; vice president and general manager, A. H. Marks; vice president and works manager, E. C. Shaw; vice president and sales manager, H. E. Raymond; vice president and assistant sales manager, W. B. Miller; secretary, C. B. Raymond; treasurer, W. A. Means; additional members of the board, O. C. Barber and C. C. Goodrich. The official statement follows:

"Goldman, Sachs & Co., announces for itself and Lehman Bros., New York City, and Kleinwort Sons & Co., London, that arrangements have been completed for the purchase by the B. F. Goodrich Company (New York) and the transfer to it of the property and business of the Diamond Rubber Company. The companies, as is well known, occupy premises in the city of Akron, O., and are two of the half-dozen largest and most successful concerns of the kind in the United States, each manufacturing a great variety of rubber goods, including automobile tires.

"The consideration to be paid by the Goodrich company is to consist of $15,000,000 of the seven per cent. cumulative preferred stock and $30,000,000 of the common stock of the B. F. Goodrich Company. For the purpose of enabling it to carry out the transaction the B. F. Goodrich Company will immediately call a meeting of its stockholders for the purpose of authorizing an increase of its capital stock by the issuance of an additional $15,000,000 of the preferred stock and an additional $30,000,000 of common stock.

"When this increase of stock shall be effected, the capital of the B. F. Goodrich Company will consist of $30,000,000 of seven per cent. cumulative preferred stock and $60,000,000 of common stock. Goldman, Sachs & Co., and Lehman Bros., of New York City, and Kleinwort Sons & Co., of London, have agreed to purchase from the Diamond Rubber Company a large block of the stock of the B. F. Goodrich Company, which, together with the previous purchase of stock made at the time of the organization of the present B. F. Goodrich Company, will comprise about one-half of the entire issue of the preferred stock of the latter company and a considerable amount of the common stock as well.

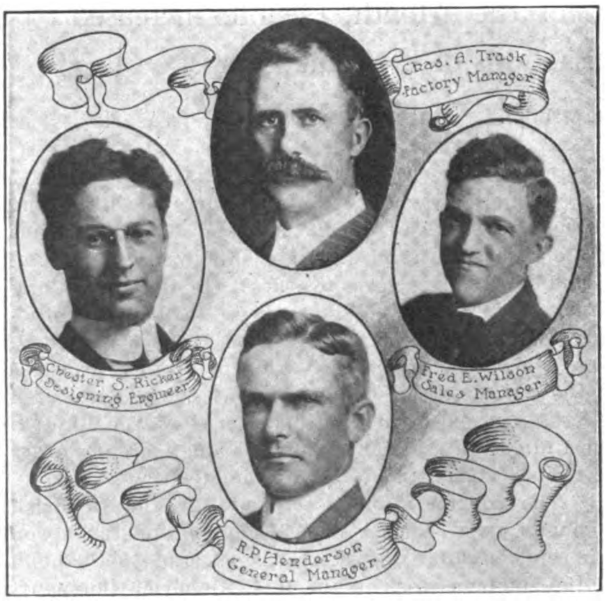
"It is expected that in consequence of the acquisition of this interest by the banking houses named and the distribution of a portion of their stock among their clients a very much broader market for the securities of the B. F. Goodrich Company will exist in the future than has ever existed for the securities of either the old B. F. Goodrich Company or the Diamond Rubber Company. Stockholders of the Diamond Rubber Company upon the distribution of its assets will receive a considerable amount of cash in addition to their several shares in the stock of the B. F. Goodrich Company preferred and common.

"The Goodrich company will retain the executive staff of the Diamond Rubber Company in addition to its present staff, and it is not expected that any radical change in organization or operating conditions will occur."

PRODUCE HENDERSON CAR.

Organization of Company Which Will Manufacture Indianapolis Machine Is Completed.

Much interest attaches to the organization of the Henderson Motor Car Company, Indianapolis, Ind., announcement of which was made recently, largely because of the position held by the Henderson Motor Sales Company, to which the new concern is a logical successor. The personnel of the old distributing agency for Cole cars, made by the Cole Motor Car Company, is represented in the new, with the addition of several names which have been more or less prominently identified with the automobile industry for several years.



Department Managers with the Newly Organized Henderson Motor Car Company.

L. Carter, the president, also is one of the largest stockholders in the Cole Motor Car Company. R. P. Henderson, vice president and general manager, was connected with the Parry Manufacturing Company for a number of years, and has been identified with his brother in the management of the Henderson Motor Sales Company for a considerable period. C. P. Henderson will remain in complete charge of the Cole sales organization, retaining his position as a director of the Cole Motor Car Company, although one of the principal stockholders in the new concern.

Lucius S. French, the secretary, will be in charge of the Henderson advertising. He not only enjoys a wide acquaintance among motor car dealers, but he also possesses a practical knowledge of automobile advertising which has been gained by successful sales promotion work which he has accomplished in the past. The finances will be under the direction of C. K. Share, treasurer, formerly treasurer of the Willys-Overland Company, and a recognized authority on automobile office systems.

Fred E. Wilson is the new Henderson sales manager. He formerly held the same position with the Marion Motor Car Company and is well known by dealers throughout the country. The Henderson factory is to be operated on a system which was perfected by Factory Manager Charles A. Trask, formerly director of one of the largest plants of the General Motors Company. He has only just returned from an extended trip abroad, studying automobile manufacturing plans in Continental Europe and in the British Isles. He also is quite prominent in the Society of Automobile Engineers, being chairman of the committee on papers.

Chester S. Ricker, the chief engineer, is one of the most prominent motor car engineers in the country. He has taken an active interest in the S. A. E. work during the past year, having read a number of papers before that society. Perhaps he is best known as a technical expert, and the articles on motor car construction from his pen have attracted much attention both in and out of the industry.

The advantages of an energetic and harmonious organization have been demonstrated by the Hendersons in the past, and their success has been due, in a large measure, to the fact that every member of the force was a specialist in his respective line. This policy is noticeable in the enlarged concern. The new car will be shown to the public for the first time during the progress of the 500-mile race on the Indianapolis motor speedway, May 30. It will sell for a moderate price, and is claimed to be the only one produced in Indianapolis selling for such a figure.

SPLITDORF CONCERN EXPANDS.

Additional Capital Brings About Reorganization of Established Company for $3,500,000.

The entire automobile industry is interested in the announcement of the formation of the Splitdorf Electrical Company, duly incorporated under the laws of New Jersey, with a paid-in capital of $3,500,000, which will take over the business heretofore conducted under the name of C. F. Splitdorf, Inc., at Walton avenue and 138th street, New York City. The concern is an entirely new organization with a stock issue of $1,500,000 in seven per cent. cumulative preferred shares and $2,000,00 in common stock. John F. Alvord, president of the Torrington Company, Torrington, Conn., is direct sponser for the new corporation and becomes its president, while Charles F. Splitdorf has been elected vice president.

C. F. Splitdorf, Inc., is one of the best known concerns in the industry. The growth in the production of Splitdorf magnetos, coils and spark plugs has been decidedly marked, and in the face of strenuous competition has made its impression upon the European market as well as at home. It may be stated in passing that the name of Splitdorf has been connected with electrical devices of one nature or another for over half a century. It is hinted that still other electrical fittings for automobiles are to be expected from his inventive genius in the near future.

The Torrington Company is closely identified with a number of concerns, each with factory facilities in Torrington, Conn., in the manufacture of various automobile accessories, motorcycles, etc. Windshields, carburetors, motor boat engines and similar fittings have been manufactured by it, or its associates, for a number of years. The combination of these interests with those of the Splitdorf laboratories is of distinct importance.

No radical changes are contemplated, for the present at least. As has been stated, Mr. Alvord becomes president and Mr. Splitdorf, vice president, of the new organization. Bryant S. Keefer has been elected treasurer and Carlos W. Curtiss, secretary and general manager. These officers and John R. Viles will constitute the board of directors.

THOMAS COMPANY HEADS.

Since the reorganization of the E. R. Thomas Motor Car Company, Buffalo, N. Y., maker of Thomas cars, something over a year ago, the aim of the officials has been to bring about a strong organization of men, able to work together in complete harmony. It has been maintained that in the automobile business nothing is of greater importance than the personnel of the factory executive heads.

The reason for this lies in the rather complex nature of the business with its numerous departments, such as engineering, stock, purchasing, manufacturing, accounting, financing, advertising, sales, service, etc. Each requires a capable supervisor to maintain a high standard of excellence and from all is demanded the fullest co-operation in order to secure the necessary unity of action.

Accompanying photographs present the leading executive heads of this institution, each of whom has had many years of experience with the best known makers of high grade cars in America.

F. R. Humpage. Pres. & Gen. Mgr.
J. L. Sugden. Advertising Mgr.
W. J. Birmingham. Factory Superintendent
J. J. Ramsey. Secretary & Treasurer.
W. L. Gleason. Asst. Gen. Manager.
F. H. Trego. Chief Engineer.
Geo. Fitzsimmons. Sales Manager.

Officials and Department Heads of the E. R. Thomas Motor Car Company.

SUCCESSFUL TIRE SALESMAN.

A particular instance in which a salesman has won deserved promotion after several years of earnest endeavor to prove his worth to the concern with which he is connected, is that of John H. Kelly, recently appointed sales manager of the Republic Rubber Company, Akron, O., maker of Republic tires. Mr. Kelly was for nine years manager of the Chicago branch of the company, the business of which grew under his direction until it was second in importance only to that conducted by the home office, itself.

John H. Kelly, Sales Manager, Republic Rubber Company.

He is decidedly well known in the motoring world, largely because of his connection with the reliability runs and hill climbs conducted by the Chicago Motor Club, of which he is a member. In fact, his acquaintance is much wider than the industry, as for 14 years prior to his connection with the tire business he was actively engaged in the sale of bicycles. As member of the Cycling Club of Chicago he was particularly enthusiastic in promoting this cause, pushing his wheel over most of the highways of northern Illinois in the interests of good roads and the mount which he represented.

Soon after becoming identified with the Republic Rubber Company, as manager of the Chicago branch, Mr. Kelly joined the Chicago Automobile Trade Association and a little later was selected as one of its directors. As was true of every endeavor with which he became identified, this association received his very best effort. Undoubtedly, while the members will join with many others who know him, in congratulating him upon securing added responsibilities in his new field, they cannot help regretting that his removal to Akron will result in a distinct loss to motoring activities in Chicago.

HEADS MARION COMPANY.

Official announcement is made of the reorganization of the Marion Motor Car Company of Indianapolis, Ind., negotiations which have been under way for some weeks having resulted in the signing of the necessary agreements. The capital of the concern has been increased from $100,000 to $1,125,000, with $625,000 common stock and $500,000 preferred.

J. I. Handley, President Marion Motor Car Company.

Under the terms of reorganization J. I. Handley, until recently vice president of the United States Motor Company, becomes president, and the major portion of the stock is owned by him and John N. Willys, president of the Willys-Overland Company of Toledo, O. It is stated, however, that the new concern is in no way connected with the manufacture of Overland cars, or with the American Motors Company, with which it will be remembered Mr. Handley was long connected as president.

The Marion Motor Car Company, which has been closely identified with the Overland interests for some time past, now becomes an absolutely independent and self-contained organization and will continue the manufacture of two models of touring cars. Within a few weeks, it is expected that President Handley will announce a strong personnel of Marion officers, which, it is understood, he has been recruiting from the ranks of his competitors. In addition, it is stated that plans are under way for the construction of another large and modern plant in connection with that now owned in Indianapolis.

CROXTON COMPANY EXPANDS.

The Croxton Motor Company, maker of motor cars, taxicabs, etc., with present factory at 2260-2264 East 69th street, Cleveland, O., has plans prepared and is receiving bids for the construction of an entirely new plant at Washington, Penn., which it expects to occupy Aug. 1. The concern will reorganize, taking out a charter under the laws of Pennsylvania, to be known as the Croxton Motor Car Company, with capital of $300,000. J. P. Stoltz, president and general manager, will retain his positions. The new directors from Washington will be as follows:

John H. Donnan, vice president of the Citizens National Bank; A. M. Linn, president of the First National Bank; A. C. Warne, treasurer of the Washington Trust Company; J. B. Bigger, director of the Real Estate Trust Company; C. S. Caldwell of the A. B. Caldwell Company; G. W. Dudderar, managing secretary of the Washington Board of Trade, and J. I. Brownson, attorney at law and director of the Washington Trust Company.

UNITED STATES RUBBER PLAN.

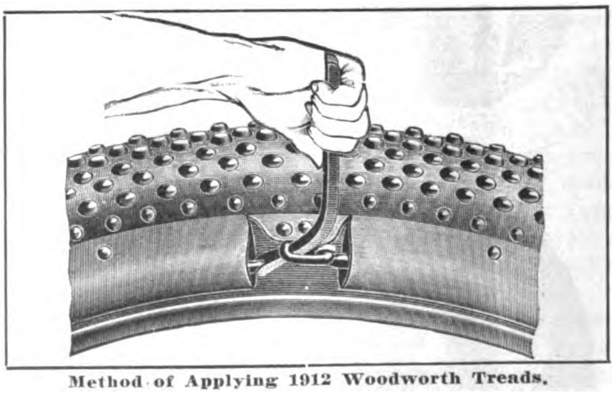
At the annual meeting of the United States Rubber Company in New Brunswick, N. J., May 22, President Samuel J. Colt reported that the company found it desirable to increase its cash capital by $10,000,000 to finance manufacturing extensions and to take care of increased production. The plans suggested called for a total authorized capital stock of $120,000,000, instead of the present $75,000,000, this to be divided into $40,000,000 common and $80,000,000 preferred shares. The increase will be represented by $15,000,000 common and $30,000,000 preferred, the distribution to be as follows:

A dividend of $5,000,000 of the new common stock to present stockholders which would be at the rate of 20 per cent. of their present holdings. Ten million dollars of first preferred to be offered ratable to all stockholders at par and accrued dividends. To submit an offer to the holders of the present second preferred issues to exchange their stock for the new first preferred on a basis of 100 shares of the existing second preferred for 75 of the first preferred.

NEW WOODWORTH TREADS.

The Leather Tire Goods Company, Niagara Falls, N. Y., has made several improvements in its well known Woodworth treads. The method of holding with coil springs is retained with the springs made much longer than formerly, so that only six or eight are used on each side of the tire. This makes it possible to connect them much quicker than formerly. The hooks on the ends of the springs are made of separate pieces of metal, inserted in the coils so that they can be adjusted by screwing in or out. This new hook takes the place of that formerly made from the end of the spring. With the tread a tool is furnished which enables one to hook the springs in one motion, the method being shown in the illustration. The great advantage of the spring method of fastening is that the tread is always kept tight to the tire, and cannot get loose to rub and chafe the rubber.

Besides the improved fastenings, the 1912 treads are made of leather finished by a new process by which it is prevented from becoming hard and cracking. The middle rivet heads, where the greater portion of the wear comes, are carefully tempered, and are so hard that they will give double the usual amount of wear. The treads are guaranteed by the maker not to injure the tire, with the agreement that if, when used according to instructions, they should do so, the Leather Tire Goods Company will replace it by one the same make. The company has prepared a new indoor hanger and an outside advertising sign.



Method of Applying 1912 Woodworth Treads.

TRUCK SALESMEN "KILL" PROSPECTS.

Argument Condemning All Other Machines Often Used, Creating Distrust of Inquirers and Resulting in the Rejection of Vehicle Seriously Considered.

The greatest enemy of the motor vehicle industry, especially that division producing service wagons, is the agent or salesman who essays to strengthen his argument by direct or indirect statements derogatory of the machines produced or sold by rivals. It is believed by many that salesmanship consists chiefly in analyzing another automobile, car or wagon, and emphasizing what are maintained to be errors in design, faults in construction, inadequacies in material and poor workmanship, as well as inefficiency in actual use. The seemingly prevailing opinion is that the creation of distrust in the mind of a prospective purchaser with reference to all other vehicles of the same class is a sufficient reason why those machines should be rejected and that under consideration should be accepted.

This statement may appear sweeping, but it cannot be too strongly emphasized. While it is essential first of all that a salesman should be thoroughly informed of every mechanical detail, every purpose of design, every fact relating to service of the vehicle he sells, it is not to be assumed that he will know other machines as well as that in which he is directly interested. He would indignantly resent a statement that rival salesmen knew as much or more about his car or wagon as himself, yet he deliberately creates the impression that he knows all other motor conveyances equally well. In assuming this attitude he justifies it by statements that are either economies of the truth or exaggeration of fact, or declarations without reflection and prompted by ignorance of mechanics.

Engineers are agreed as to certain established principles but there are few so rash as to condemn that of which they have little or superficial knowledge, but with the supreme confidence born of ignorance the salesman proceeds systematically and deliberately to discredit the vehicles sold by competitors. From every aspect and angle he endeavors to establish weaknesses and faults. He deals with conditions of which he has extremely limited knowledge and asserts personal experience. He describes the differing services and what may be accomplished. He always deals with extremes. He is not satisfied with an average or conservative requirement or result. There is never wear and there is the minimum of economy. He can accomplish what may apparently seem impossible undertakings and without reaching limitations.

The salesman meets all manner of hypothetical questions as nonchalantly, and he is certain of any statement made. He points out that the driver, perhaps without experience, can cope with any situation that may arise. Nothing is impossible, resources of mentality and facilities are ample and always available, and everything that may happen will be met with under circumstances that are always favorable. But with any other conveyance there is a complete reversal of conditions.

The purchaser may be impressed, but not convinced, and he makes inquiry of others selling the same class of machine. His surprise may be judged when he hears each vehicle lauded by the salesman and all the others, including that he lately investigated, roundly condemned. The good business man is a wise listener. He asks questions and learns that every other motor wagon built is junk and in every way unserviceable. They are defective and inefficient and valueless, and if one is in condition to operate it is the exception, not the rule. In many instances one may merely change the names of the vehicles and of the competitors, to establish the really satisfactory machines, and the arguments are alike.

As the prospective buyer learns that every machine he considers is the only dependable and reliable transport, that all others are worthless or unreliable at best, it is not strange that he forms the opinion there is not one in which he is justified in making investment. Instead of buying he decides to wait and observe results, a very natural conclusion, entirely justified by the character of information he has received.

The primary fault is with the manufacturer who tolerates this manner of selling. His own business interests should impel the education of his representatives to the fullest extent necessary to demonstrate machines and sell them. He ought to have personal knowledge of the methods of those selling his products, and there is no good reason if he does not. The agent selling the machines cannot afford to have novices as salesmen. It is necessary that he employ the most capable and well balanced men he can engage, because they are dealing, if with service wagons, with men of affairs and with large propositions. They must make consistent statements and give logical reasons for every conclusion reached. They must serve as advisors, and be capable of analyzing existing methods of haulage and devise means for using the machines to obtain the largest measure of their superior speed and capacity. They must be able to grasp a situation and apply to it practical methods, and know how to utilize men to secure the most productive results. They ought to have knowledge of service of similar character, and they should be competent to suggest the manner of maintenance and care that shall be the most economical.

Such salesmanship cannot be expected from boys or drivers, nor from those who have no experience with business. What might be acceptable in one instance might be exactly reversed when applied to another. Each prospect presents new phases, which demand different applications of the uses of the wagons. The man who knows is seldom willing to make unqualified assertions, and the better informed he is the more careful he is in his comment.

The man who is a good salesman never has reason to discredit another machine. He is able to so present the qualities of what he is describing that these are impressed upon the visitor. There is no weakness in solid facts and under any circumstances there is nothing to be gained by making extravagant and unfounded claims. The man who can say good things of his competitors is losing nothing. He has nothing to retract nor to regret, and his statements carry conviction. Honesty of speech is as essential to business success as is honesty in dollars and cents, and it is just as valuable an asset as cash when dealing with the man who wants advice by which he can improve his service and incidentally further his own prosperity.

Advertising Copy for the ACCESSORY and GARAGE JOURNAL requiring submission of proof must be received by 5th of month to insure publication in issue of the 15th of month.
Advertising Copy, proof not required, accepted to morning of the day before publishing day (unless such day is Sunday or holiday, when previous day is limit) of each publication.
Remittances should be made by Check, Draft, Postoffice or Express Money Order, or Registered Letter. Money enclosures must be at sender's risk.

THE NEED FOR SYSTEM.

One of the newer vocations is that of the business systematizer, the man who installs in a business house a system of records and accounts which enables cost to be calculated to a fraction of a cent, with every detail which contributes to the making up of that cost accurately known. The large firms found that they could not work blindly in the dark, being satisfied if they obtained a profit and raising prices when the profit did not appear. They had to know the details of cost so that reductions could be made where possible, and leaks eliminated. Just as system is required for a large business, so is it necessary for a small house.

There is no need for a complicated system such as is demanded in a large factory, but every garage should have some means of keeping account of work done in the shop, and of supplies and parts used. Charges on a given job are based upon the time and supplies consumed, and there is nothing more uncertain than the memory of the average repairman where these two things are concerned. Interested in his work, he forgets time, and in the end it is guessed at. Gasoline and oil used are forgotten, and bolts, nuts and cotter pins are too small to count. The only remedy is a system which is simple and yet will keep forever after the workman making him record every moment he puts in on a job, every pint of oil or gasoline, and every part down to the smallest piece of wire.

THE APPEARANCE OF THE GARAGE.

Storekeepers have long realized that the appearance of their establishments counts greatly in securing trade. The public goes to the well lighted attractive stores which use plenty of white paint and electric lights, while it refuses to visit the man who continues in an ancient and dusty atmosphere. The garage is but a store, though it sells service more than merchandise, and like the latter that which presents the most attractive appearance wins the most trade.

There is many a garage which could be made attractive by the expenditure of a comparatively small amount. A coat of paint on the front improves the looks of a place a hundredfold and in customers attracted may pay for itself in a week. The improvement should not be confined to the outside, however. Inside, the walls should be painted, or at least whitewashed, the grease and dirt scraped off the floor, and the corners cleaned of their miscellaneous collection of useless parts and dirty waste. A neat attractive shop spells clean work to the owner, while he hesitates to patronize the man who pays little attention to appearances.

THE MACHINE TOOL DEPARTMENT.

Many garages have had the experience of seeing a steady customer go to another to have a difficult job done—and never come back. If work that cannot be handled is turned away, that which can be done is very liable to go too. It is possible to sell a man gasoline and oil, patch his tires and grind his valves with great success, with the result that he is perfectly satisfied, but when he finds he cannot get the frame welded or step attached because the garage has neither a welding outfit nor a drill press, he will change his opinion, and the man who can do the work he wants will get it all.

It once was true that when a part on an automobile broke it was scrapped and a new one was bought from the maker, so that all the dealer had to do was to fit it. Now the garage is expected to be able to repair the part, or make a new one. This calls for a complete machine equipment. In fact, many machine shops have found it quite profitable to install an automobile repair department and have become direct competitors of the regular repair shops, with decidedly successful results.

CORRESPONDENCE ON MECHANICAL SUBJECTS.

Firing Order of Motor.

(64)—Will you explain why a four-cylinder motor fires 1, 2, 4, 3, or 1, 3, 4, 2? I would like to know why the explosions take place in these orders instead of 1, 2, 3, 4. WILLIAM SHAKESPEARE.
Waltham, Mass., April 28.

The object of a four-cylinder motor is to produce power by a series of impulses of frequent occurrence rather than a lesser number of stronger explosions. The arrangement of the components is such that while one cylinder is firing, those next in order are compressing, exhausting and inspiring a fresh charge respectively, and at the end of the power stroke, the piston that has just compressed is ready to transmit the power produced by the explosion of the gas and keep the crankshaft revolving.

The construction of the crankshaft of a four-cylinder motor is such that two pistons are up while the other two members are at the bottom of the stroke and the explosions instead of occurring simultaneously during one stroke, and then waiting till three idle strokes had taken place before repeating, are spaced equally, one occurring each half revolution of the crankshaft in the following order, for example, 1, 2, 4, 3. As two pistons are going up while two are going down, the parts are mechanically balanced, one set of moving parts weighing exactly the same amount as the other.

With the motor firing as above referred to the piston of the No. 1 cylinder would be at the top of its stroke ready for firing. That of the No. 2 cylinder would be at the bottom of its stroke or ready to compress its charge of mixture. The piston of the No. 3 cylinder would also be at the bottom of its stroke, but about to expel the burnt gases on the exhaust stroke. The piston of the No. 4 cylinder would be at the top of its stroke about to descend for the intake of the mixture. When exploding 1, 3, 4, 2, the only difference is that the No. 2 cylinder is exhausting and the No. 3 compressing, or reverse to that of the firing order 1, 2, 4, 3.

Making Asbestos Gaskets.

(65)—In overhauling my ——— car I spoiled the asbestos gaskets used between the exhaust manifold and cylinders. The bolt holes are very close to the edges of the manifold and in trying to fit the gaskets have broken a large number, as the asbestos crumples and tears easily. Have tried several ways without success. Can you suggest some way to make them without using up considerable of the material? J. V. D.
Houston, Tex., April 30.

Asbestos, especially if thin, is difficult to handle unless one be familiar with the material. As the manifold is of iron the gaskets may be made easily by taking a piece of asbestos of the desired thickness and slightly larger than the manifold. The asbestos is then placed upon the latter as depicted at Fig. 1 and held securely while the sharp edges of the metal, as shown by the dotted lines in the drawing, are tapped lightly with a ball pein hammer. The blows will cause the metal to cut through the asbestos so that the gasket proper will be separated easily from the piece.

In cutting out gaskets for aluminum members care should be exercised, as the metal is broken easily. In fitting these gaskets they should be smeared with a paste composed of powdered graphite and oil which will enable their removal without damage, thereby saving the trouble of making new members. If more than one gasket is essential for the same port member, because of any variation of the manifold, the members should be cemented together with shellac and the graphite utilized on the exterior surfaces, as previously outlined.

Series and Multiple Series Wiring.

(66)—I have noticed reference made to series and multiple series methods of wiring batteries, and that when dry cells are wired in multiple more current is obtained and that it is the best way, as it is cheaper. Will you kindly explain the difference between the methods and why more electricity is secured? CHARLES KENYON.
Portland, Me., May 3.

A single dry cell of standard construction is capable of developing only 1.5 volts and has a capacity ranging from 15 to 23 or more amperes, the amount varying according to the make. It may be explained that the voltage represents the strength of the current and the amperage the flow or amount.

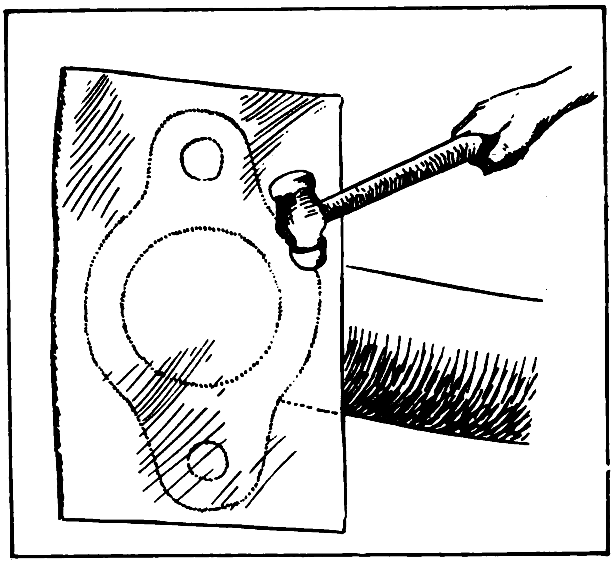

Fig 1—Outlining Method of Cutting Out Asbestos Gaskets with Ball Pein Hammer.

If voltage be desired, for example, six or eight volts for operation of a coil utilized for ignition purposes with the motor car, a number of cells would be connected together by what is known as a series connection; that is, so that the current flows through the cells in succession each increasing the voltage of the preceding cell by an amount equal to its own voltage. Thus six cells wired in series as depicted at the top of Fig. 2 would give six times 1.5 volts or nine volts. Connecting cells in this manner does not increase the amperage or quantity of current, but rather decreases the amount as the resistance is increased by the series connections, cutting down the current flow.

To increase the rate of current flow, the cells are connected by what is termed parallel, in which all of the zinc terminals are connected in one group, and the carbons in another, each terminal wire being connected to all of the battery terminals of the same kind as indicated in the second row. When cells are thus wired the voltage is the same as of a single member, but the amperage is increased by an amount equal to the product of that of one cell multiplied by the number of cells. Single members, or groups in series, may be connected in parallel, and these groups may be considered a single cell of large voltage.

When series groups are in parallel the combination is known as series parallel or multiple series. This arrangement is shown at the bottom of the illustration in which three groups of four cells in series are depicted connected in multiple. The total voltage in this instance is equal to that of four cells in series, or four times 1.5 equals six volts, and the rate of flow is equal to three times that supplied by one series group. If the cells be connected to an outside circuit requiring a given amount of current, the demand on each battery is one-half of that on a cell in a single series group.

The advantage of the multiple series is that the demand on the individual cells is reduced thereby increasing their life, and at the same time the desired voltage is obtained. The efficient output of a single group of cells in series is usually limited to one-quarter ampere, and by placing two such groups in parallel it is possible to secure double this value or one-half ampere, and with but one-half the demand upon the batteries. The greatest efficiency from dry cells is obtained when the lowest discharge rate in amperes is obtained. Any number of cells may be connected in multiple series and by increasing the groups of series the service will be augmented proportionately.

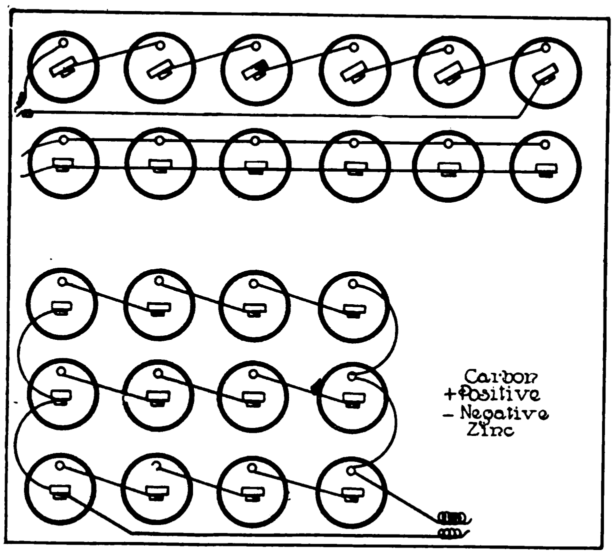

Fig. 2—Explaining Wiring of Dry Cells, Six Being Connected in Series; the Same Number Wired Parallel, and 12 in Multiple Series.

Lubrication of Motor.

(67)—Please inform me which is the best make of oil to use with an automobile engine? I have a Ford car and last year used a standard make of lubricant. This year I purchased a cylinder oil less well known. Do you think it is a better oil for a Ford machine?

ELIZA B. HART.

Princeton, Mo., April 24.

It is poor policy to change from a recognized high grade oil to a new product because of its attractive price, as the experiment may prove costly. It may be pointed out that the difference in cost at the end of the year will amount to a few dollars at the most, while on the other hand, should the new lubricant not perform its function properly, the repair bills would be greatly in excess of the net cost of the highest priced lubricant on the market.

It is poor economy to experiment with lubricants, and it will be noted that every manufacturer recommends the use of a recognized standard oil for his motor car. The experienced automobilist is not misled by the attractive literature and prices of unknown concerns, and adopts a high grade lubricant and continues its use thereby effecting economy.

Representative manufacturers of lubricating oils have conducted exhaustive experiments and tests to ascertain the best grade of lubricant to meet each and every individual requirement, be it for automobiles, motorcycles, motor boats, aeroplanes or stationary engines, and this information dealing with every make of automobile will be mailed free upon application. The product of these makers is sold in cans or barrels bearing their name and trade mark and the buyer is thus assured of protection in purchasing. By referring to the Classified Buyers' Guide in the Accessory and Garage Journal, the names and addresses of the leading representative makers of cylinder oils and lubricants may be ascertained.

Starting on the Switch.

(68)—Will you please explain the following to me? I have a scheme for starting up an old car without cranking it. I am thinking of connecting some batteries to my sparker. I can also add a push button for each cylinder. Then I can push a button and get a spark in any cylinder, so if I catch one with compressed gas, the engine will start. If I pushed the button on one that had not reached centre, it would start her backwards. Would this do any harm? Or, if I fired on dead centre, would it burst the water jacket or do any other harm to the engine? Is there a system like this on the market? J. M. HAIR.

St. Albans, Vt., May 1.

Adding a push button and proper connections at the magneto or batteries so as to produce a spark in each cylinder should start the engine, but if this produces only one spark, it must be connected with a form of distributor to have it always occur in the one containing the compressed gas.

Even if the engine should start backwards, nothing can happen, and by shutting off both spark and throttle it will soon come to a stop. Then another start can be tried.

Trouble With Axle Dishing In.

(69)—Will you please assist me in present trouble? I have been greatly annoyed by the appearance of the back of my car, which appearance is caused by the rear wheels leaning in at the top very much. This gives the car a "knock kneed" look, which I do not like and want to fix, if I can. I doubt if the car looked that way when I first obtained it, about a year ago.

LEON W. KUHN.

Canaan, Conn., May 2.

The trouble is depicted graphically in Fig. 3 herewith. This shows that the dishing in or "knock kneed" appearance of the rear wheels is due to the sag of the rear axle at the centre. In substance, the axle tubing with the truss rod below has not been strong enough to withstand the severe usage it has received on the road.

Normally, the wheels should stand vertically, as shown by the centre line B B, or else, they may have dished outward slightly as indicated by the line C C. As A A is the present centre line, the difference between the three lines at the road surface (or at the top if you prefer) shows the urgent necessity for adjustment.

The truss rod below is there for this purpose, and must be shortened, thus pulling the ends in, straightening the axle housing and also straightening up the wheels as they should be. To proceed with this work: Back off the locking nuts on the turnbuckle adjustment so it will be free to move. The two parts of the rods are threaded in opposite directions, one right hand the other left.

When the turnbuckle is rotated with a wrench, after jacking the entire rear axle up off the floor, of course, this draws in both sides at once. A square should be built with about a 12-inch base and a long enough vertical leg to reach to the top of the tire. Set this against the bottom of the wheel and measure the distance to the top before starting to adjust. After about one full turn, measure this again. Continue in this manner, until the centre line position B B is reached. You can use your judgment about proceeding to give it a slight outward dish at the top to the position C C. The advantage of this follows: If the sag of the axle continues after adjustment, considerable of it will be already provided for; that is, considerable of it can take place before the wheel position comes past a vertical.

In the sketch, the relative positions have been greatly exaggerated to bring out the point. If the rear construction is in as bad shape as this shows, it should not be tackled by the amateur, but sent to the factory.

Auto Signalling Code.

(70)—Will you please advise me if there is such a thing as an accepted code of signals for use in touring or driving in an automobile? By this, I mean is there any signal which is recognized all over the country as meaning the same thing, so that it could be used with safety all over? DEWITT R. DOOLITTLE.

Hartford, Conn., May 3.

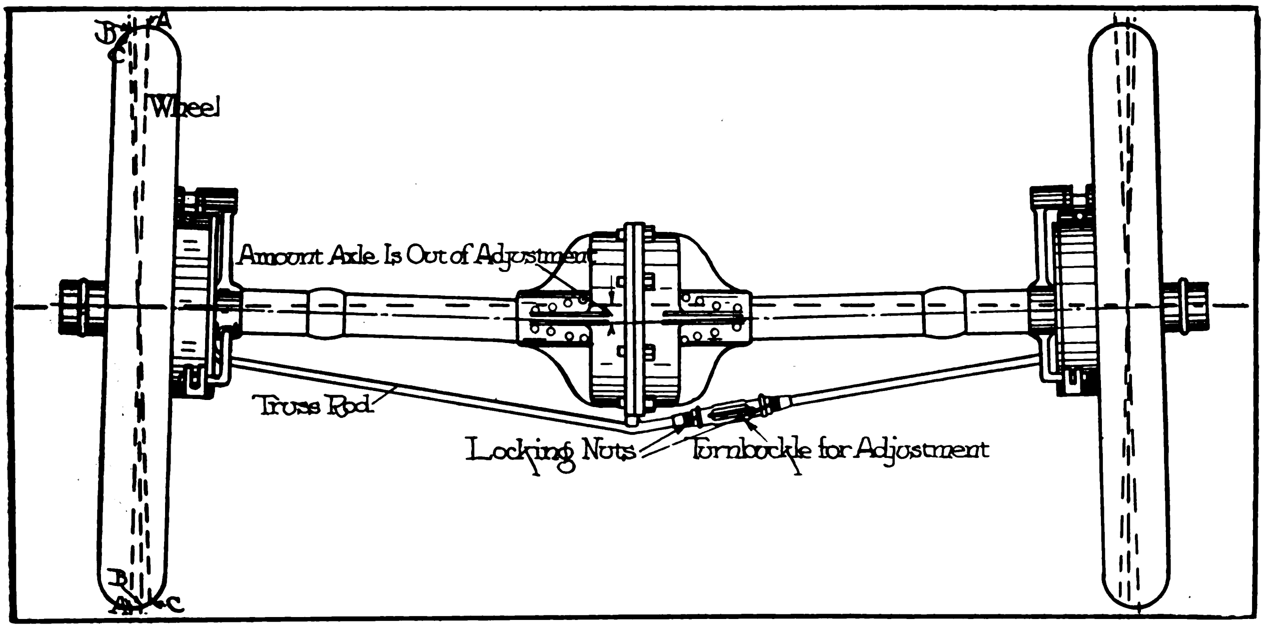

Fig 3—Sagging Rear Axle, Bowed Wheels Resulting, and Method of Adjusting the Same by Truss Rod.

While it cannot be stated with absolute certainty that any one code is used all over the country, a list of signals adapted from boat signals is here given, which is believed to be used over a large portion of the eastern part of the country. A sign which is very general throughout the East, is the horizontal extension of the right arm at full length to indicate to a car behind that the driver is about to stop or slow down. The adaptation from the boat code follows:

Auto Signalling Code.

(1)	When running ahead and going to make port or to stop.	One long and one short blast of horn, to be sounded not less than 30 yards from stopping point.
(2)	When coming to a standstill, or have made port.	One short blast.
(3)	Going to start ahead, or leave port.	Five short blasts.
(4)	When standing still and going to back up.	Two short blasts.
(5)	Starting ahead slow on bad roads, slippery or muddy.	Three short blasts.
(6)	Going to turn to left at road crossing, to be sounded before starting to turn.	Four short blasts.
(7)	Going to turn to right at road crossing.	Two short and one long blast.
(8)	In passing a slower car on port side (left).	Three long blasts.
(9)	In passing when abreast on port side.	One short and one long blast.
(10)	When crossing intersecting roads, signal must be blown at least 20 yards distant from crossing.	Two long and two short blasts.
(11)	Coming to forks of road, if any cars, teams, vehicles coming in opposition use marine signal code; will turn to left; always keep on right side of roadway.	(Starboard) Two long blasts.
(12)	Calling for assistance if stalled on the road.	Five long blasts.

As a suggestion, motorists who have done considerable touring are asked to write this office relative to the above, giving their views and experiences, so that a satisfactory and fairly universal signalling code of this nature can be compiled, using this one as a basis.

Question of Compensation.

(71)—Please inform me what it is worth to take care of an automobile in the owner's garage, the work involving washing, polishing, replenishing the supply of fuel and oil and inflating tires when needed? E. L. TRAVIS.

Washington, D. C., April 28.

There are a number of conditions to be considered, such as how many times the machine will have to be washed and polished and how particular its owner is as to its appearance, also how much service will be required. Garage charges vary from $5 a month for dead storage, where the owner takes care of his own machine and pays for the washing and polishing, to $30 a month for full care. The price for the work mentioned varies from $1 for a small runabout to $2 for a large machine. Charges for live storage are $15 upward, depending upon the size of the automobile and location of the garage; that is, in some cities the cost of garaging is considerably more than others. Regarding the salary, this would appear to be a subject in which the owner would be interested as well as the caretaker.

TO ENRICH GASOLINE.

Acetrol is shortly to be placed on the market by the Acetrol Company, which was recently formed in Milwaukee, Wis., by P. C. Avery of the Avery Portable Lighting Company, maker of the Electrobola lamp. Acetrol is a chemical compound which is to enrich gasoline by producing acetylene, it is said.

WHO'S WHO IN THE INDUSTRY.

EDENBURN WITH REMY COMPANY.

The predilection of the Remy Electric Company, Anderson, Ind., maker of Remy ignition and lighting equipments, for newspapermen is made still more evident by the enrollment of W. D. Edenburn as publicity and assistant advertising manager. This is the sixth graduate from the news gathering field which has been added to the Remy force, and he is by no means the least known of the six.

W. D. Edenburn, Publicity Manager, Remy Electric Company,

Mr. Edenburn goes to the Remy people from the Indianapolis Sun, where he was manager of the automobile department. He was formerly automobile editor of the Indianapolis Star, where appeared many of his expert articles on racing, shows and other features of motor car activity.

Last summer Mr. Edenburn was closely associated with the Indiana Automobile Manufacturers' Association, and one of the active promoters of the idea of the Four-States tour.

WILL EXPLOIT COLE CARS.

The accompanying illustration is that of Homer McKee, who has been appointed to succeed Lucius S. French as general manager of the Henderson Motor Sales Company, Indianapolis, in full charge of the advertising of Cole cars. As is well known the Henderson company is general distributor for the product of the Cole Motor Car Company of that city.

Homer McKee, General Manager, Henderson Motor Sales Company.

Mr. McKee has been a writer of automobile copy for a number of years, and his work has attracted unusual attention at the New York and Chicago shows. His style is intimate and his understanding of the demands of the industry broad in its scope.

Furthermore, he has had extensive newspaper and magazine experience, and is recognized as one of the best known men in the advertising business, particularly with motor cars.

Few American machines have had the benefit of more efficient exploitation than the Cole. Mr. McKee brings to his new position, not only an intimate knowledge of his chosen field and the Cole car, but a wide circle of friends and acquaintances who will join in congratulating him and the Henderson Motor Sales Company upon his selection to carry forward this work.

PERFECTED REMY MAGNETO.

The accompanying illustration is that of I. J. Reuter, chief engineer of the Remy Electric Company, Anderson, Ind., to whom the company gives credit for developing and perfecting the present type of inductor magneto made by this concern. He succeeded President B. Perry Remy as engineer previous to the sale of the Anderson Electric Company.

I. J. Reuter, Chief Engineer Remy Electric Company.

The new RD type of inductor magneto, bearing the Remy name, is the result of Mr. Reuter's genius. He has improved and refined the product of the company in many ways, among which may be mentioned the use of Bakelite instead of hard rubber for insulating material. He also has reduced the size of the instrument without decreasing its efficiency. Another improvement is the substitution of ball bearings, and one of his latest achievements is the new vibrator coil, especially adapted to self-starting devices, by means of which a shower of sparks is shot into the cylinder about to be fired, instead of the usual single spark.

Mr. Reuter was at one time designing engineer for the Willys-Overland Company, Toledo, O., and is more or less well known in the industry. He graduated from Purdue University in 1906 and is a member of the Society of Automobile Engineers and of the Indiana section, S. A. E.

GRAPHITE FOR INNER TUBES.

According to "Graphite," an excellent substitute for talc or soapstone as a lubricant for inner tubes in shoes, is flake graphite. Being chemically inactive, it is claimed to have no deleterious effect upon rubber, is more lasting than soapstone, effectively prevents chafing and heating of the tube and helps to make the fit more snug in the casing.

UP-TO-DATE Machine & Tool Equipment

The quality of work turned out by a garage is dependent upon the machine and tool equipment of the repair shop no less than upon the ability of the repairmen. While some men, given a hammer and a wrench, and with a lathe at their disposal, can make almost any repair that comes into the shop, they are rare, and work performed under such conditions is bound to result less favorably than when ample facilities are provided.

Today, when automobilists are demanding more accurate and exact work from the garage, and are bringing in jobs that were formerly considered hopeless and beyond repair, the repair shop must be thoroughly equipped to do all kinds of machine work if it is to secure and retain trade. It is the garage with the best equipment that gets the big jobs.

If a man has a job of welding, and the garage where he has been buying his gasoline has no welding outfit, he may be expected to hunt up a place where he can get the work done. As a result, the first shop not only loses the profit on that particular piece of work but places itself in a position to lose the man permanently. It is not good business policy, other things being equal, to turn any work away as the customer may find some other establishment which can and will do all his work. It is because of the necessity for keeping old customers, as well as obtaining new ones, that the outlay for modern machine equipment must be considered.

When viewed from the standpoint of first cost, many men think that the expense of some machines is too great, and that the automobile trade of the vicinity will not be sufficient in the particular line of work which the machines perform to warrant the expenditure. This is often, in fact usually, a mistaken idea, and the garage proprietor has not seen the full field from which he may draw custom. There is no especial reason why a drill press in a garage should work on automobiles only, except that the owner does not go out after any other class of work.

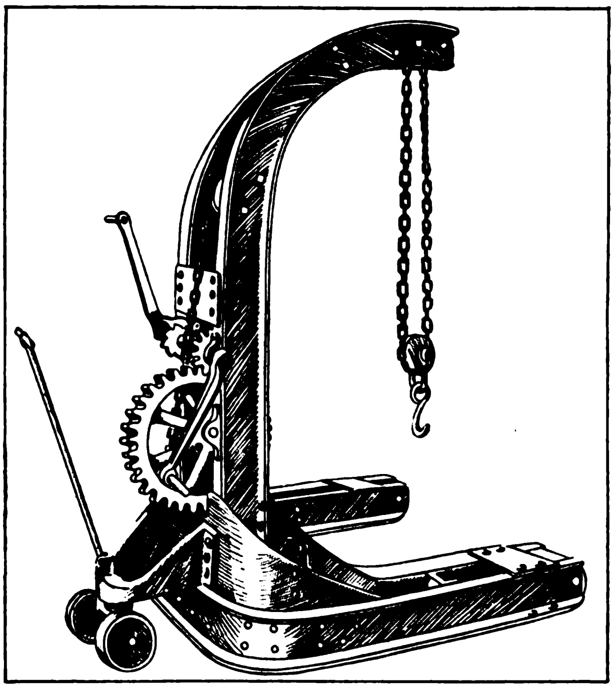
A garage with a good machine equipment is fitted to do all the work of the modern machine shop, just as the latter can make automobile repairs with great facility. Many a machine shop has found in this class of work a decided addition to its trade, and a few garages are beginning to realize that with a good machine equipment they may find in the usual machine shop work an excellent source of income during the dull months.

Years ago, the blacksmith who repaired a man's wagon forged the braces for his house, made his furnace irons, and repaired his factory machinery. The blacksmith who was content to do his work in the old way, with his comparatively few and simple tools, remained a blacksmith, and today only shoes horses. The man who kept abreast of the times and installed new and improved machinery now owns the machine shop. The garage will follow in the steps of the blacksmith shop and degenerate into a storage establishment and gasoline dispensary unless heed is taken from the handwriting on the wall and facilities provided to keep the trade which is drifting to the machine shops.

With a view to suggesting methods for taking advantage of the opportunities afforded along these lines, this department will describe each month some of the latest and best of the machines and tools which are of value in garages and repair shops.

Portable Crane.

Outside of a lathe, perhaps the most useful device a garage can have is a portable crane. Not only does it save the time and strength of repairmen but it makes possible work that could not be performed by men alone. Motors, transmissions, unit power plants etc., can be lifted out of a car in a fraction of the time that otherwise would be required, without a particle of danger to either the men or the part, and with the minimum of effort. The whole front or rear of an automobile may be lifted several feet in the air, to facilitate repairs. Used in this way, the crane surpasses a repair pit, as it may be brought up to a window or other convenient source of light, while the pit often is found to be too dark. The repairman is also given more room in which to work.



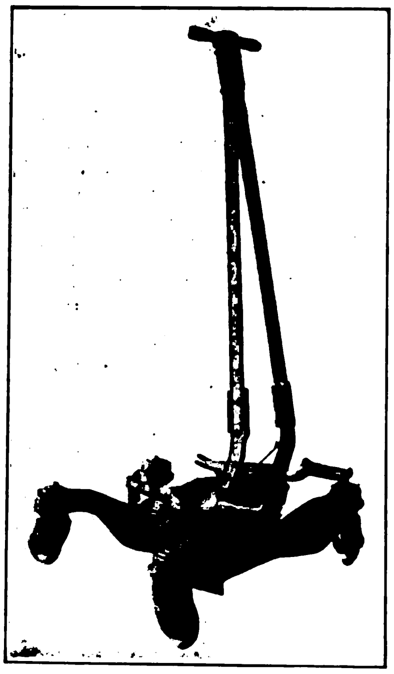
LaFayette Portable Crane.

The LaFayette Engineering Company, LaFayette, Ind., is making a steel portable crane which should prove especially valuable for garage use. It may be operated by one man and enables him to lift the heaviest part unaided. The feet go underneath the chassis and are long enough to render the crane perfectly stable. The overhang is three feet six inches, so that it has sufficient reach to get around a car in almost any position. It is easy to push around even when loaded, as the wheels run on roller bearings. All parts of the machine are of steel, with machine driven steel rivets, so that it is exceedingly strong and durable. The chain is tested to three tons and is wound on a drum by hand, large reduction gears minimizing the effort required. The weight complete is 900 pounds.

Canton Auto Jack.

Two things always found around a garage are a jack and a truck, though the latter is perhaps not as common as the former. With the jack things are raised, and with the truck, carried around the garage wherever desired. Often a machine has to be jacked up before it can be moved, and when so lifted with less difficulty than before only when the jack is provided with wheels.

The Canton Auto Jack, made by the Canton Foundry & Machine Company, Canton, O., is a device of this character, namely, a jack on wheels. It has been designed especially for use under the front or rear axle of a car, and the construction is such that one man can raise weights of from 3000 to 4000 pounds from nine to 21.5 inches. It fulfills the requirements of a jack for garage use in that it is sturdily constructed, capable of lifting heavy weights, adjustable to different heights of axle, simple and fool proof in operation, and may be worked by one man.



Auto Jack Designed for Garage Use.

It will be found particularly valuable in moving cars whose front or rear wheels are disabled, as it may be placed under the axle, elevated a few inches, and the car moved on it and the other wheels with ease. With this jack a machine with either the front or rear axle removed is not immovable, but may be wheeled about the garage by one man, using the handlebar. The lifting ratchets are controlled from this bar, the left hand operating a pawl which is brought into play readily and saves stooping. The handlebar is four feet long, affording good leverage.

The supporting antlers and the stem have heavy square threads, these insuring durability. The long antlers will be noted in the illustration, and are used on the rear axle, shorter members being utilized for the front member. Both are adjustable as to height. When the car is elevated on the jack the wheels may be removed and the car still be pushed around the garage. The device is constructed of high grade material throughout and may be had with either three or four wheels.

Power Drill.

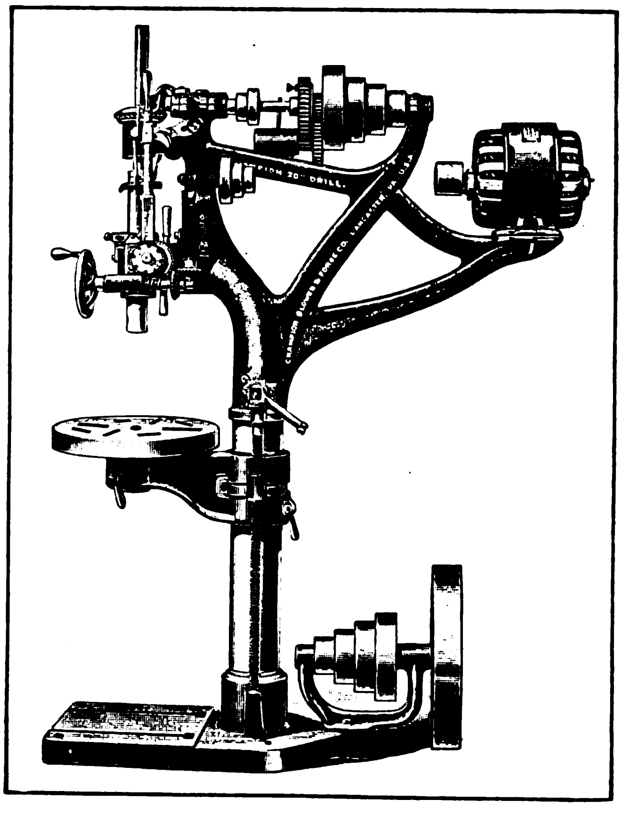
Another decidedly useful machine is a power drill, as those who have tried to drill steel by hand have abundant reason to know. Not all garages have a source of power, however, and in that event a power drill necessitates obtaining such a source, unless it be equipped with electric drive, as is the 20-inch double back geared upright power drill, made by the Champion Blower & Forge Company, Lancaster, Penn., and illustrated herewith. This is fitted with an electric motor, which may be had in various styles to be used on any type of current.

As nearly every garage is wired for electric lights, this drill has an almost universal application, current being taken from a convenient bulb socket by means of the usual plug and cord. The electric motor is held on an arm of the frame, at such distance from the driving pulley that the belt is long, giving an even uniform drive. Control of the motor is easy, being at all times under the direction of the operator without moving from his position at his work, through a switch conveniently placed.

The machine may be used either as a plain drill or as a back geared drill, the change being made in an instant by sliding the gears in or out of engagement by means of a lever. It will drill with perfect accuracy holes up to 1.5 inch, and is simple in operation, yet has all the feeds and speeds and automatic features on much more complicated devices. Eight speeds are provided, with power, hand screw and lever feed. The gears are machine cut and the bearings are large, insuring long service.

The spindle is counterbalanced by a weight in the hollow column, thus relieving the spindle arm of undue strain and making a substantial construction. An automatic stop attachment is provided with a quick return lever, which gives a rapid motion to the spindle. The table is lowered and raised by means of a screw, which is quick in action and self-locking, holding it steady and firm. The handle which operates the screw is conveniently placed.

The drill works to the centre of a 20-inch circle. The spindle is 1.25 inches in diameter and is bored with a No. 4 Morse taper, with a graduated sleeve. The drive is from the motor to pulleys by means of a two-inch belt, the pulleys being of the four-step variety, eight inches in diameter, and with 2.5-inch face. The speed for ordinary drilling is 300 revolutions a minute. A hanger attachment for drilling rims, which will be found very useful about a garage, may be had as extra equipment. The weight complete is 900 pounds.



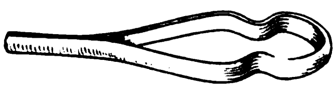
Champion Electric Drive 20-Inch Drill.

DESIRABLE ACCESSORIES FOR THE DEALER.

Descriptions of the Newest and Most Popular Lines Which the Up-to-Date Agent May Handle with Profit.

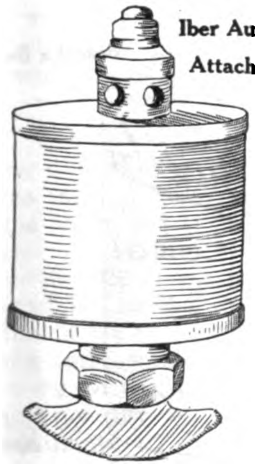
A Self-Spreading Cotter Pin has been brought out by Barthel, Daly & Miller, New York City, and a feature of the device is that ends open automatically, and may be driven into the bolt, nut or other place as one would a nail. This saves time, inasmuch as the ends of the pin do not have to be opened as is the case with the usual members.

Self Spreading Cotter Pin



—— ★ ——

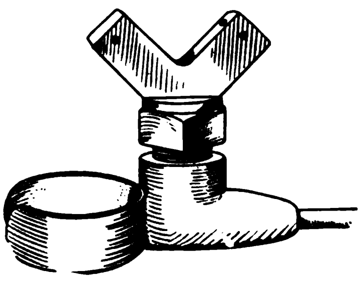
The Iber Automatic Attachment, made by the Motor Attachment Company, Poughkeepsie, N. Y., is a device which operates in conjunction with the carburetor and it is stated by the maker that it will regulate or balance the suction of the pistons when these draw different amounts of mixture from the vaporizer. It is also claimed that a perfect vaporization is brought about, that the intake manifold is always filled with the proper mixture, and that the device automatically operates quickly at low speeds and slowly at high, thereby equalizing the suction on the carburetor. The instrument requires no adjusting whatsoever and may be fitted to any type of standard carburetor. It is held that it will save 25 per cent. of the fuel, increase power and make starting easy. It is applicable to any type of internal combustion engine.



Iber Automatic Attachment

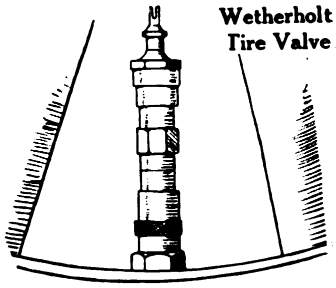
The Ferguson Gas Burner attachment, manufactured by J. Ferguson, 9 West 63rd street, New York City, is a device for converting oil lamps so that acetylene may be utilized. It consists of a burner carrying member, integral with which is a spring like clip and a metal tube. The first named is slipped over the oil burner and does not interfere with its operation. The device is fitted by drilling a .25-inch hole in the side of the lamp and passing the pipe through the opening, allowing about one inch to project on the outside for the purpose of attaching the lead from the gas tank or generator. It is claimed by the maker that the burner consumes but .125 cubic foot of gas an hour and that an ordinary tank will supply three burners for 300 hours. The attachment is fitted easily and is not expensive.

Ferguson Gas Burner



—— ★ ——

The Wetherholt Tire Valve, produced by W. C. Wetherholt, Columbus, O., is designed to control automatically the pressure of tires and to prevent over inflation. The importance of proper inflation is well known and is usually determined by the use of a separate pressure gauge, the operation involving the testing of the tire after it is pumped. The Wetherholt device is so constructed that in case the tire has been pumped up over the required pressure, or expansion has taken place through friction, the valve will open and release the excess air, preventing the bursting of the shoe. Each valve is set according to the proper pressure of the size of shoe with which it is employed, and tested accurately before leaving the factory. The maker points out that it is a well known fact that in hot weather the pressure increases with friction and that air in a shoe inflated when cool will expand in service. All parts of the Wetherholt valve are interchangeable.

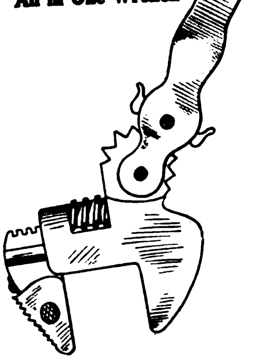


Wetherholt Tire Valve

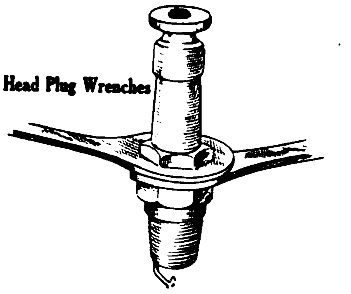
—— ★ ——

The All-in-One Wrench, marketed by the Universal Wrench Company, Indianapolis, Ind., is a combination tool about nine inches long, constructed of high grade steel and nicely finished. It is fitted with an adjustable jaw which may be employed for removing nuts, etc., and this may be reversed when the service of a pipe wrench is desired. The jaws may be adjusted to eight different angles by means of a ratchet device, which also permits the use of the tool in places inaccessible with ordinary wrenches. It is claimed by the maker that it is sturdily constructed and will withstand all ordinary stresses.

All in One Wrench



Red Head Spark Plug Wrenches are produced by the Emil Grossman Company, New York City, maker of the Red Head plugs.

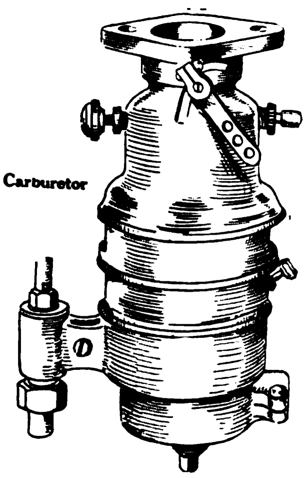


Red Head Plug Wrenches

The wrenches come in sets of two and by their use danger of breaking the porcelain is avoided. In disassembling a plug with an ordinary wrench the insulating member is easily cracked, especially when removing or tightening the bushing. With the Red Head wrenches, one is utilized to hold the shell and another fits the bushing. These devices are furnished with a set of four plugs or may be secured for a small sum and are adaptable to standard types of spark plugs.

★

The Scott Carburetor, manufactured by the Scott & Sons Company, Medford, Mass., is a double needle vaporizer in which the auxiliary air valve is not actuated by a spring, and it is claimed by the maker that it supplies a correct mixture at substantially the same stress at all speeds and automatically adjusts itself to altitude. These qualities are obtained by the action of the auxiliary air valve which controls the high speed needle member, differing from those of ordinary form inasmuch as it is slabbed tapering on three sides, producing a like number of fine sprays and facilitating vaporization of the fuel. The valve moves in accordance with the speed of the piston, that is to say, it moves downward as the speed increases, and as the taper on the needle is inverted the flow of fuel is increased and vice versa. A feature is the fitting of a starting valve which may be operated from the radiator or dash. An air adjustment for high speed is incorporated over the auxiliary member and a low and high speed adjustment for the fuel. The only spring utilized is that in conjunction with the high speed needle and it is claimed that its operation is such that it is not impaired by long service. The maker emphasizes the fact that the carburetor is adjusted easily and that when once set requires no further attention.



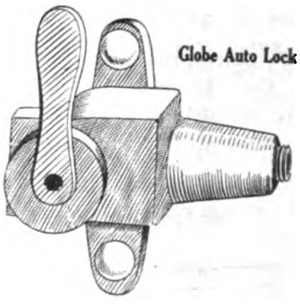
Scott Carburetor

★

Caldwell's Gas Tubing will appeal to motorists who have experienced trouble with acetylene lamps due to leaky piping. The ordinary rubber tubing is short lived as the weather affects the material and it becomes hard and cracks easily, thus causing a loss of gas. Sometimes the apertures are minute and the escape of acetylene is not noticeable. This loss is augmented when the burners are clogged as the pressure is increased at the tank to obtain the desired flame. While water does not affect rubber, the oxygen in the air in time hardens the compound which loses its life or elasticity. The Caldwell tubing consists of a heavy and high grade material, which is covered with braid by a special process, this being closely woven yet not diminishing the flexible qualities of the piping. This covering protects the rubber from the air, thereby keeping it soft and considerably lengthening its life. It is pointed out by the maker that the material will endure as long as the braid is intact and that the latter is very durable. Being sturdily constructed it is not affected by the vibration of the automobile and the dark colors of the braiding harmonize with that of the machine and add to its appearance. The tubing is produced by the Caldwell Manufacturing Company, 1756 Cranston street, Providence, R. I., and is comparatively inexpensive.

Caldwell Gas Tubing

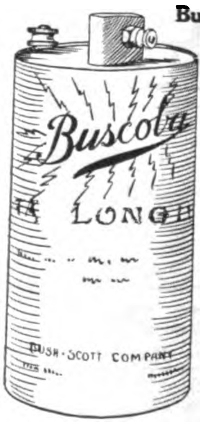
The Globe Auto Lock will appeal to motorists, inasmuch as use or theft of the automobile is prevented. It is a simple, compact attachment in the form of a valve and provision is made for inserting in the fuel line. It may be fitted to the outside of the car body, under the front seat or any other convenient place, and when the lever is moved it shuts off the supply of fuel positively and locks the device. The loss of gasoline by flooding or leaking of the carburetor is avoided and in the event of the vaporizer catching fire the main supply is quickly shut off. When the valve is locked, the machine can only be operated for a very short distance, this depending upon the amount of fuel in the carburetor. The device is manufactured by the Globe Auto Lock Company, Canisteo, N. Y.



Globe Auto Lock

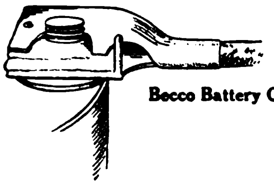
★

The Buscoba Dry Cell is marketed by the Bush-Scott Company, Detroit, and is made to meet the demands of those desiring a high grade special dry battery, applicable for internal combustion engines and all electrical purposes. It is of the usual form, being round, and is equipped with screw terminals. The maker claims extra long life and recuperative powers. The cell is covered with a yellow wrapper to distinguish it from other makes.



Buscoba Battery

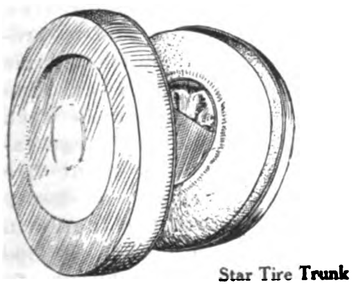
The Becco Battery Connector, manufactured by the Beck Company, Rockville Centre, N. Y., is an improvement over the ordinary form inasmuch as the construction of the device is such that it is claimed it cannot jar loose when properly attached. It is made in the form of a clip, two members being pivotally mounted and provided with a recess to fit the terminal of a battery. When placed over a binding post and the clips snapped together, it is stated that the use of a screw driver or similar tool is necessary to release the members. The device is made of heavy drawn brass, and is neat and inexpensive.



Becco Battery Connector

★

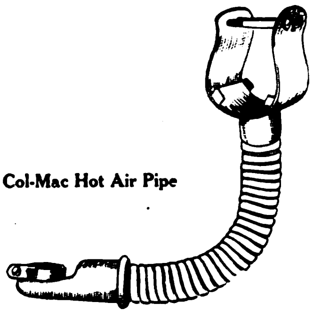
Star Tire Trunks will appeal to motorists of discriminating tastes as they are constructed in the form of a shoe and are very neat in appearance. They are made of pressed steel with a polished finish, and are light, strong, durable, clean and noiseless. A compartment is provided for the storing of inner tubes, and the trunks are thief and water proof. A feature is their accessibility. They are marketed by W. W. Winship, Boston.



Star Tire Trunk

★

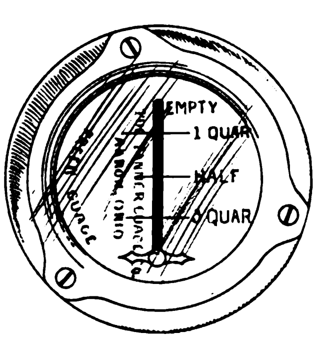
The Col-Mac Hot Air Pipe is a device for facilitating the vaporization of the fuel at the spraying nozzle. It consists of a metal bound flexible tubing in one end of which is a member so constructed that it fits over the air intake of the carburetor and is held in place by an adjustable ring and lock screw and nut. The other extremity is U shaped and is placed over the exhaust pipe where it is secured by means of two machine screws. By this arrangement heated air is taken from the exhaust pipe and drawn in through the tube to the carburetor, past the spraying nozzle. The hot, dry air not only effects a saving of gasoline but eliminates choking, condensation and freezing. It is claimed that sluggish motors will pick up quickly with the device and that climatic changes do not affect the action of the carburetor. Where a machine is not fitted with a pan or undershield it will prevent water and foreign elements being drawn into the vaporizer, thereby avoiding trouble from this source. The device is inexpensive and is applicable to any motor. It is manufactured by the Breeze Carburetor Company, Newark, N. J.



Col-Mac Hot Air Pipe

★

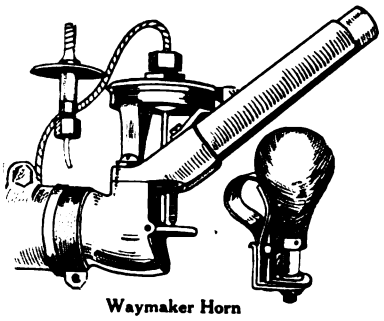
The Freer Liquid Gauge is designed to overcome carburetor troubles caused by the use of improper measuring devices, such as dirty sticks, etc. It consists of a reading dial fitted with heavy plate glass and calibrated to indicate the amount of fuel in the tank. An indicator moves freely over the face of the dial and is actuated by a float in the container, the float rising and falling, thus moving a rod connected with the registering member. It is adaptable to any type of fuel tank either gravity or pressure feed, and the glass member permits of noting the amount of fluid in addition to the indicator. It is produced by the Tanner Gage Company, Akron, O.



Freer Liquid Gauge

★

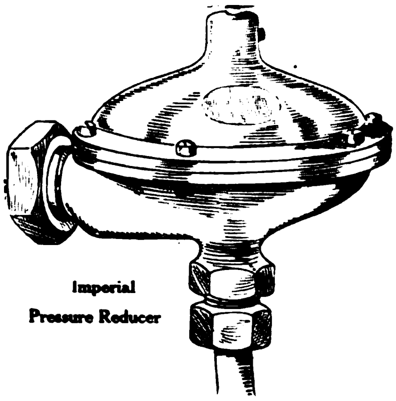
The Waymaker Horn is a new type brought out recently by the Lee Tire & Rubber Company, Conshohocken, Penn., and differs from the usual exhaust actuated members inasmuch as it is operated by a miniature rubber bulb located on the steering wheel or in any convenient place. Connecting the bulb and device controlling the exhaust gases is a flexible tubing wound with metal for protection. When the bulb is pressed a valve-like device allows the gases to flow into the horn, the amount depending upon the pressure exerted on the bulb. The signal is attached to the end of the exhaust pipe leading from the muffler and is easily and quickly fitted. The Waymaker horn is also made with foot control.



Waymaker Horn

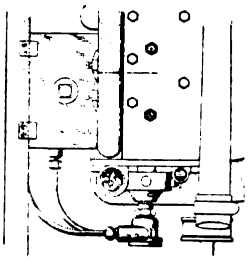
★

The Imperial Pressure Reducer is designed to reduce properly the pressure and to regulate automatically the flow of acetylene from tanks, the pressure of which may vary. It is a neat, compact device, attached to the usual connection of the tank and is so constructed that the pressure is reduced from 300 pounds to as low as two ounces. It delivers a steady, even flow of gas whether the container be empty or fully charged. It will appeal to motorists contemplating the fitting of an acetylene self-starting device as with the reducer the desired and necessary pressure may be obtained. It is made by the Imperial Brass Manufacturing Company, Chicago.



Imperial Pressure Reducer

The Pedersen Oiling System for model T Ford cars is manufactured by the Pedersen Lubricator Company, New York City, and is similar in operation to the oil pumps made by this concern. It consists of an oil tank, pump, tubing and an adjustable sight feed indicator. The pump is attached to the timer shaft by a nut, this operation requiring the fitting of a new commutator cover which is a part of the equipment. The oil container is secured to the frame or any other convenient place near the motor and a pipe leads from the vessel to the pump and another to the indicator on the dash. Still another tube carries the lubricant from the sight feed member to a pet cock in the crankcase. When the motor is operating the pump draws lubricant from the tank and forces it to the dash device, equipped with an adjusting screw by means of which the amount of oil fed to the crankcase may be regulated to a nicety. As the speed of the engine increases the amount of oil pumped is in proportion and it is claimed that smoking is eliminated, as well as the necessity for refilling the crankcase. The pipes are cut to length and provided with connections ready to screw together and are attached easily.

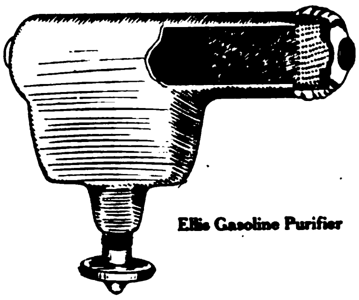


Pedersen Oiling Pump

★

Worden's Auto Pliers, produced by E. M. Worden, Ladysmith, Wis., is a combination tool which will appeal to motorists and repairmen, it being stated by the maker that it represents 15 tools in one. Among the important offices which they fill are a pipe wrench, wire cutter, screw driver, nail puller, belt puncher, cotter pin tool, etc. They are constructed of a high grade of material, nickel plated and guaranteed by the maker.

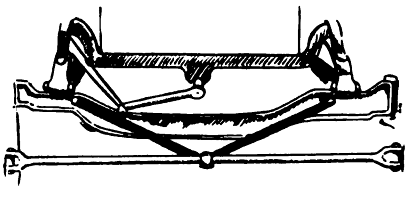
The Ellis Gasoline Purifier differs from a fuel filter inasmuch as the device not only separates water from the fuel, but kerosene and dirt. It is a compact device, weighing about six ounces and is inserted in the fuel line between the supply tank and carburetor. The gasoline first enters the precipitation chamber and is filtered through two fine screens, two felts and quartz. Any water in the gasoline will lodge in the precipitation space while the fuel, being lighter, will rise and flow to the vaporizer. The device is equipped with a knurled thumb screw by means of which accumulations of water, dirt, etc., may be drained easily and quickly. It is made of an aluminum composition and comes complete for attachment. The L. P. Rhines Company, Boston, is special agent.



Ellis Gasoline Purifier

★

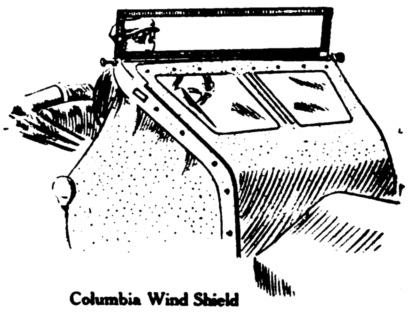
The Little Steersman is a spring device designed for attachment to the tierod and axle so that in the event of an accident to the steering gear or the breaking of any of its components, the front wheels are kept in alignment. It consists of a helical spring, constructed of oil tempered steel wire, with attachments for the end and centre. The latter are drop forgings. It is claimed that the Little Steersman makes driving easy, and takes up automatically lost motion between the steering gear and wheels. It is nickel plated and does not detract from the appearance of the machine. It is produced by the Modern Auto Appliance Company, Chatham, N. Y.



Little Steersman

★

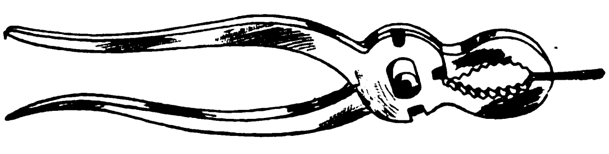
The Columbia Windshield is custom made by the Columbia Top & Tire Company, Boston, and is constructed both for the protection of the passengers in the front seats and the tonneau. When fitted to the latter it may be utilized as a light service table by folding back the upper part. It is made of flexible leather covering a light brass frame, steel lined, and the use of glass is avoided. Several adjustments as to positions are provided and it is claimed that the wind is deflected in such a manner that it does not strike the occupants of the rear seat.



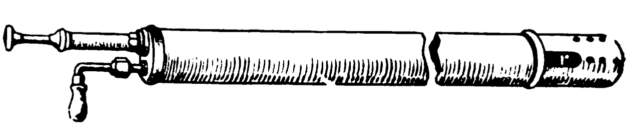
Columbia Wind Shield

★

The Turner Hot Blast Tubular Gasoline Torch is a new product of the Turner Brass Works, Sycamore, Ill., and is said to produce an intensely hot blast flame easily controlled by a gasoline valve. Its construction is such that it is adaptable to a large variety of work. It is about five feet long, constructed of heavy gauge brass tubing, two inches in diameter, with a burner at one end and a pressure pump at the other. The long tube is utilized to contain the supply of fuel and holds about three quarts. A unique feature of the appliance is the controlling valve inside the tube which regulates the flow of the gasoline in such manner that the torch may be used in any position. A pump supplies air pressure in the fuel chamber. The size of the flame at the burner is 12 inches long and two in diameter. The torch weighs about 16 pounds and it is claimed that a quart of fuel will last an hour.

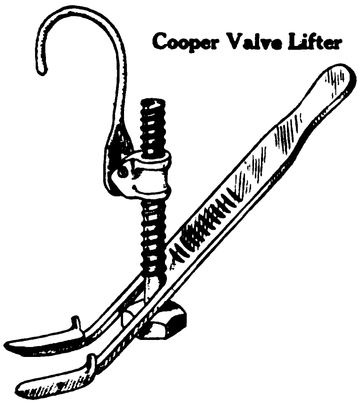


Worden's Auto Pliers



Gasoline Torch

The Cooper Valve Lifter is the invention of John J. Cooper, Providence, R. I., and differs from the usual tool of this nature in that means are incorporated whereby the instrument may be locked securely after the valve spring of a poppet valve has been compressed, enabling the operator to use both hands in removing the cotter key or retaining members. The device consists of a U shaped member, one end of which bears upon the valve proper while the other extremity is fitted with a movable threaded screw rod. The lower end of the latter is recessed to take a lever slotted at one end and having a bearing upon an enlarged portion. The forked part of the lever is slightly upturned and is equipped with two tilting shoes pivotally mounted which are designed to be self-levelling and to bear evenly against the retaining member of the valve spring when the latter is compressed. The inner edges of the movable shoes are adapted to engage the rim of the collar of spring to prevent the lever from moving too far forward. The upper surface of the lever is fitted with deep notches for the purpose of engaging and retaining a brace member which is interposed between the serrations and threaded screw or nut. The length of the screw is such that the valve lifter may be utilized on any sized engine by changing its adjustment, which may be accomplished easily with the tool in position.



Cooper Valve Lifter

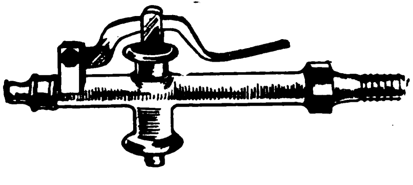
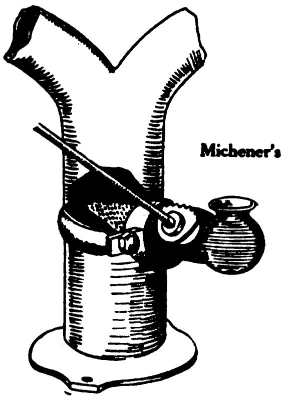
The Waste Not Water Nozzle has been brought out by A. W. Gamage, Ltd., London, England, to prevent an excessive waste of water when washing the motor car or other vehicles. It is fitted to the end of the usual hose and in place of the regular nozzle is provided with a hand cock and lever. Normally the water is shut off and to obtain use of the fluid the lever must be depressed. When released it automatically shuts off the supply. It is claimed that the initial cost of the device is saved in water bills in a short time as chauffeurs are prone to allow the fluid to run while performing other work in connection with the cleaning of the machine.



Gamage Water Nozzle

——★——

Michener's Gas Saver and Primer, made and marketed by E. S. Michener, New Castle, Penn., is a device for attachment to the intake pipe or manifold by means of a brass strap and lock nuts. It is hand controlled, and is fitted above the carburetor and operated from the dash by an adjustable rod. A wire gauze cone is incorporated, this being for the purpose of breaking up the fuel and for aiding in vaporization. The hand actuated valve permits of an opening ranging from zero to .5625 inch, admitting auxiliary air, and it is claimed that an economy of gasoline is effected thereby. A priming cup is incorporated for the purpose of facilitating starting in cold weather. The device is made of solid brass, highly polished, is installed easily and is not expensive.

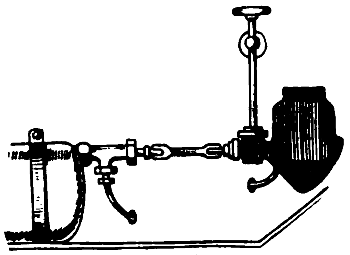


Michener's Primer

——★——

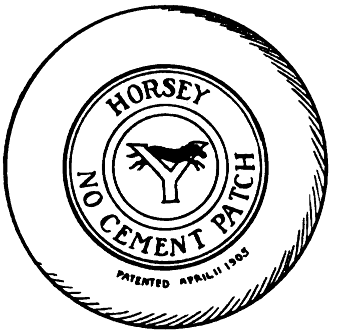
The Grinnell Gas Controller and Igniter is produced by the G. C. A. Manufacturing Company, Pittsfield, Mass. As the name implies it is designed to regulate the flow of gas from the tank to the burners, and to light the latter from the seat by the turning of a small handle which is a part of the device. It includes the spark generating instrument and is neat and compact and attached easily to the frame of the car. Connecting the controlling mechanism and tank is a universally jointed rod which is provided with adjusting means so that in the event the pressure of the acetylene becomes reduced the proper flow to the burners may be secured. The lamps may be lighted and extinguished by a simple turn of the wrist, or dimmed as desired. The controller does not interfere with the operation of ignition system of the machine, being entirely separate, and the gas tank may be renewed in the usual manner. The burners are constructed to withstand hard usage and the spark points are held by brass springs, facilitating the removal and replacement of burners.

Grinnell Gas-Controller



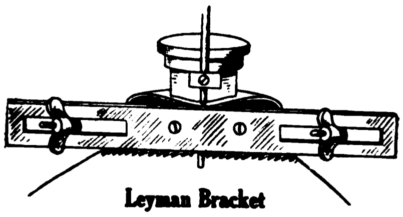
——★——

The Horsey No-Cement Patch, as the name implies, does not require the use of cements or acids in its application, the process involving but the usual cleaning of the tube, moistening the patch with gasoline and then affixing. The patch is manufactured of an elastic, open steam cured, red rubber and is made thick in the centre and tapering to its edges. To the cured part a layer of uncured material is permanently attached by a special process. It is claimed by the maker that a permanent repair may be effected because of its non-blooming qualities. It is produced by the Horsey Manufacturing Company, Cleveland, O.



Horsev Patch

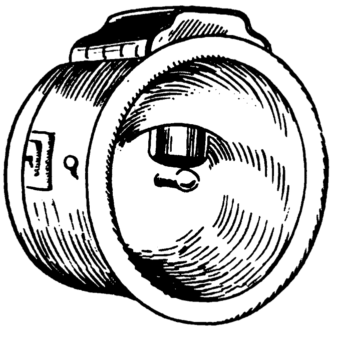
The Leyman Bracket, produced by the Leyman Company, Cincinnati, O., is a combination license plate and pennant holder. It is designed to fit over the radiator and is secured by a binding screw which allows of adjustment to any height. The license tag is held securely and away from the radiator, and it is claimed that the plate will not rattle or vibrate. Provision is made for the attachment of pennants, the staff being held by a set screw. The bracket is made of solid brass, highly finished; is fastened by means of wing nuts, and will fit any radiator having a filler member.



Leyman Bracket

—— ★ ——

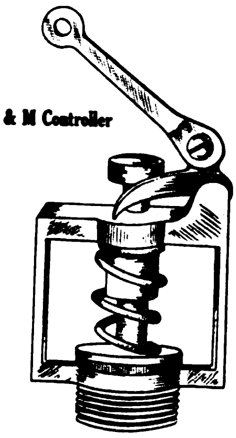
The Butylight headlights are self-contained; that is, they burn denatured alcohol under pressure and it is stated that a very high degree of brilliancy is obtained. This is brought about by the use of a mantle which is said to be impervious to vibration or road shocks. The fuel is utilized in a somewhat similar manner to the gasoline in a torch and the flame may be regulated as desired. It is pointed out by the maker that owing to the pressure in the container the last drop of alcohol will be converted into a useful product. The lamp is equipped with a pressure gauge and a valve, and it is claimed that it will operate efficiently at five pounds. Pressure is brought about by the use of an ordinary tire pump. The lamp is similar in appearance to acetylene members and fitted with a reflector which is cleaned easily. It is stated that a pair of lamps may be operated at a cost of one cent an hour. Benjamin N. Levy and William T. Fox, 32 Union square, East, New York City, are agents.



Butylite Headlight

—— ★ ——

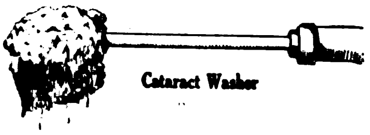
The M & M Controller and Economizer is manufactured by the Moller Bros. Controller & Economizer Company, Betz building, Philadelphia. It is designed to be inserted in the intake manifold of an internal combustion engine, the operation involving the drilling and tapping of a hole. It comprises a frame carrying a valve member which is held securely on its seat by a spring. The valve stem is fitted with a head which is in contact with a cam member pivotally mounted on the lifting lever which is actuated by a pedal convenient to the operator. When the valve is lifted the suction created by the piston of the engine draws in fresh air instead of mixture, and it is claimed by the maker that no gasoline whatsoever is drawn from the carburetor. One of the features emphasized in the device is that it may be utilized to retard the progress of the car by utilizing the compression stroke of the motor, and that as the ignition is cut off the cylinders draw in fresh charges of atmosphere thereby cooling the engine, as well as eliminating any possibility of back firing in the vaporizer. The M & M controller is equipped with a switch like device which automatically interrupts the primary circuit when the lever is lifted and by this arrangement it is claimed that rough roads may be traversed more easily, and that fuel may be saved as well. The device is compact, being about two by 3.5 inches, is inexpensive and is installed easily.



M & M Controller

—— ★ ——

The Cataract Washer, manufactured by the Cataract Auto-Vehicle Washer Company, Topeka, Kan., is designed for washing vehicles, and it is claimed by the maker that it will outlast five sponges. It consists of a metal handle for attaching to the water line and the other end of the tool is threaded to take the washing member. The latter is of best quality mop yarn and is wound about the corrugated brass head, being held securely. The water flows through the handle and finds its way through the perforations and then through the yarn. The washer is made in two styles, one having a long handle which keeps the hands out of the water and is designed for winter use. The other form permits the hand to grasp the mop for operation as with a sponge. It is stated by the maker that as the water is flowing during the washing all dirt and grit are removed easily without injuring the finish of the car. The Hagstrom Bros. Manufacturing Company, Lindsborg, Kan., is exclusive selling agent.



Cataract Washer

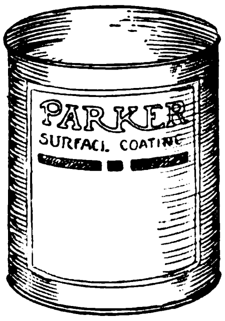
Parker's Surface Coating is a paint held to be acid and alkali proof, being produced in several colors which the maker, the Parker Refining Company, Cleveland, O., states will not fade. The cement coating is made especially for brick, stone or concrete buildings and it is pointed out that these materials are porous and absorb and hold considerable dampness. It fills and seals these pores, keeping the cement or concrete dry, clean and sanitary. It is especially adapted for garage floors and when applied produces an elastic, tough surface, making for easy cleaning and eliminating dampness.

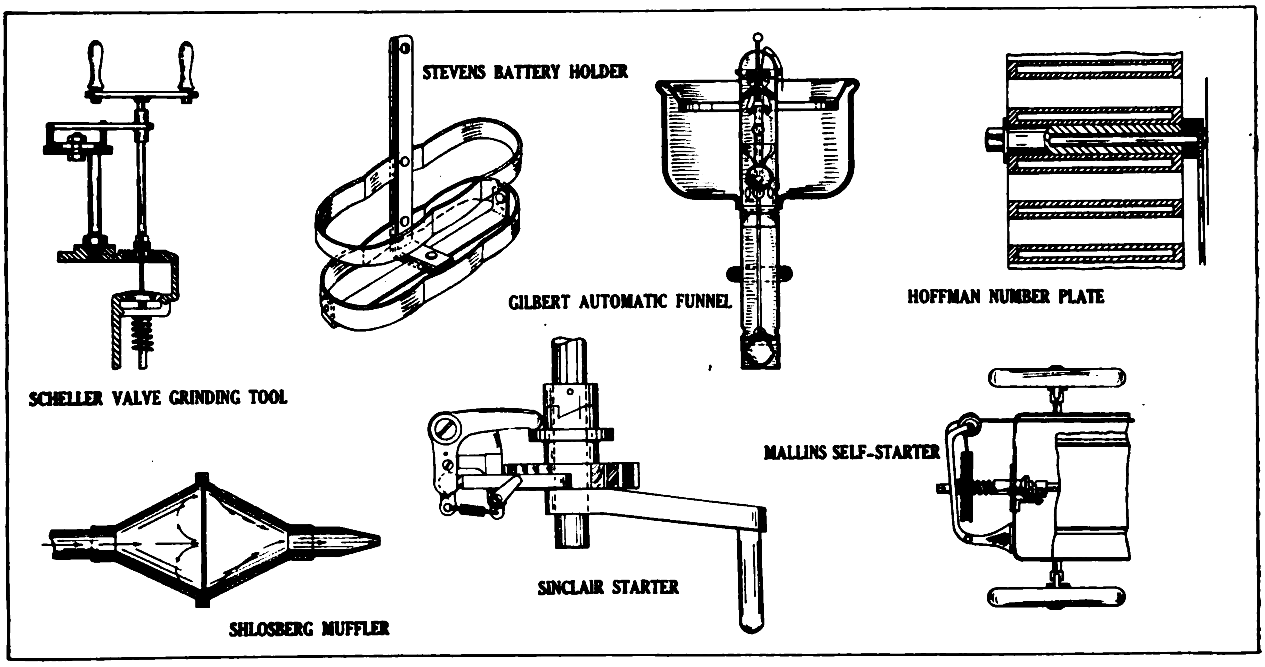


Parker Surface Coating

RECENT PATENTS of INTEREST

Scheller Valve Grinding Tool.

The valve grinding tool which may be rigidly attached to the motor during the work, and which is adjustable to any type of engine, has been patented by John Scheller, Milwaukee, Wis. It comprises a post member which is screwed into the opening of the cylinder utilized for the spark plug, and locked by a nut. The top of the post carries a horizontal arm on which is fitted a slidable extension and provision is made for locking the parts securely. The adjustable extension is hinged, and is equipped with a vertical member which serves as a guide for the vertical rod carrying the valve turning bit. The upper part of the rod is fitted with horizontal extensions which carry handles for the purpose of rotating the tool in either direction. During the process of grinding in the valve, the latter may be lifted from its seat by means of the hinged member.



Some Recent Patents of Interest to the Manufacturer, Agent and Owner, Including Safety Starting Crank, Valve Grinding Tool, Self-Starter, Dry Cell Holder, Number Plate Holder, Automatic Funnel, Etc.

Gilbert Automatic Funnel.

A patent has been granted Fred E. Gilbert, Jacksonville, Fla., for an automatic funnel having a valve mechanism whereby the flow of liquid either up or down may be controlled as desired by the operator. It is similar to the ordinary funnel except the upper portion is bowl shaped and the tube carries three valves having seats. The lower valve is fitted with a float, its function being to close the tube preventing an overflow of the funnel. Another valve controls the ports through which the liquid flows while the third member is provided with locking mechanism, preventing the movement of liquid in either direction.

Stevens Battery Holder.

The utilization of dry cells in the motor car requires caution in installing else the efficiency of the members is apt to be impaired through short circuits. The usual practise is to employ waste or paper to secure the batteries and to prevent the terminals from coming in contact with one another. Herbert A. Stevens, Malden, Mass., has been granted a patent for a battery holder which permits the installation or removal of the cells as a unit and it is claimed that the device will hold the members securely. It comprises a series of belts or band members attached to a vertical support and the low band is equipped with cross sections which serve as retainers for the cells. These bands conform to the shape of the batteries and when the latter are in position it is stated that they will not jar out of their relative positions.

Shlosberg Muffler.

Maris Shlosberg, Chicago, has patented a muffler which varies from those of usual construction in that it is cone shaped. It consists of a pair of hollow cones secured together at their bases and separated by a divisional plate having slight communicating openings between the cones located near its periphery. One of the cones is connected to the exhaust pipe while the other is equipped with a tube having an opening considerably smaller in diameter than that of the pipe. The exhaust gases from the motor enter the first cone, encounter the divisional plate, and are deflected through the openings into the second chamber, thence out into the open air. The inventor claims that back pressure is eliminated and that the noise of the explosions is reduced to a minimum.

Hoffman Number Plate.

One of the objections to attaching number plates to the front of the radiator is that the efficiency of the cooler is reduced thereby, also that the supporting members are likely to chafe the thin metal of the fins causing leaks. Peter M. Hoffman, Chicago, has been granted a patent for a number plate designed for attachment to the radiator, which he claims overcomes these difficulties. The plate is perforated, said openings corresponding to those of the cooler, and the extensions of the plate are provided with means for holding the member securely and thus eliminate chafing.

Sinclair Safety Crank.

The introduction of the self-starter for internal combustion engines has stimulated the efforts of inventors along the lines of safety devices for attachment to the starting crank so that in the event of a backfire the operator will not be injured. George B. Sinclair, Medford, Mass., has been granted a patent for a device which, it is claimed, will automatically release the clutching member of the starting crank when the latter is rotated other than in the normal direction of the motor. The extension of the crankshaft of the motor carries an integral clutch member which engages with a similar part slidably mounted, and attached to this is the starting handle. The moving member has a shoulder which engages with a bell crank pivotally mounted, and is actuated by a pawl in engagement with a ratchet wheel integral with the sliding clutch. A spring holds the pawl in contact, the latter permitting the ratchet to rotate in one direction but if the latter be reversed as by a backfire, the pawl member imparts motion to the bell crank, which being in contact with the shoulder in the sliding clutch automatically disengages the latter.

Mallins Self-Starter.

Although the self-starter is not taken as seriously in England as in this country it is interesting to note that an American patent has been granted Charles William Mallins of Liverpool, England, for a device for starting internal combustion motors from the seat of the car. It is unique in its construction, inasmuch as it is operated by pulleys and a cable. The latter, which is equipped with a shovel shaped handle on the dash, extends therefrom to the front of the motor passing over a pulley fitted to a pivotally mounted arm. The latter carries a larger pulley on which the operating cable is coiled, and is attached to an axially movable shaft provided with a coupling for engagement with the end of the crankshaft of the motor. The large pulley is equipped with a spring, the function of which is to coil up the cable, after the latter is unwound by operation. Means are provided for disengaging the clutch coupling from that of the engine shaft if the rotation of the latter be reversed. In practise the handle is grasped by the operator and when pulled brings the movable arm and clutch into engagement with the crankshaft. A further movement of the cable rotates the larger pulley which in turn imparts motion to the crankshaft of the engine. Upon releasing the handle the spring rewinds the cable. It is claimed by the inventor that the device is operated easily and that it may be attached without any great alteration to the car.

OTHER PATENTS GONE TO ISSUE.

Tank Bracket and Step, Russell Huff, Detroit. A combination of step and bracket for holding an acetylene gas tank.

Spring, William R. Park, Taunton, Mass. A vehicle spring composed of resilient leaves in sliding contact with each other and having a film of wax between adjacent leaves.

Windshield, Chicago Coach & Carriage Company, Chicago, Ill. A windshield in which both upper and lower parts may be moved into various positions, each part independently of the other.

Solid Tire, Alexander Dow, New York City. A solid rubber tire containing several separated layers of fabric, each layer being formed into undulations whose crests extend diagonally of the tire, and with the weave of the fabric extending diagonally of the piece.

Self-Starter, Louis T. Weiss, Jr., New York City. A starter using acetylene gas under pressure, a handle on the dash operating tank valve and individual cylinder valves.

Motor, James C. Peache, Rugby, England. A two-cycle engine with a single sleeve bearing the inlet and exhaust ports at opposite ends.

Clutch and Starter, E. U. G. Reagan, San Antonio, Tex. A combination of clutch and starter, in which a spring is used to turn over the motor, being wound by the latter when running.

Tire, A. William Torkington, Purley, England. A solid tire in two circular halves, held by a band bearing cross arms bolted to plates at the side of the tire.

Lamp, William K. Lenhart, Philadelphia. An acetylene lamp containing one central fixed burner and two adjustable burners, one on each side of the central burner.

Spark Plug, William Ellis, Harrod, O. Has a number of electrodes in two sets with two terminals.

License Tag Holder, John W. Yochem, Tiffin, O. Plate is held top and bottom in channels, the lower part of the device being adjustable to take different size plates.

Motor Fire Apparatus, Harry W. Eisenbise, Reading, Penn. Combination chemical and water pump, the chemical tank valves being three-way allowing chemical to be directed to chemical hose line or mixed with water in the water hose.

Pneumatic Wheel, W. W. Guest, Alameda, Cal. The tread of this is in sections, each section being connected to a piston working in a cylinder containing air. Each cylinder is connected to a compression chamber except when the piston moves inward under the weight of the vehicle.

Lamp, R. G. Harris, Knoxville, Tenn. A lamp containing three reflecting partitions whereby rays of light from one source are directed through bull's-eyes to the right, left and below.

Muffler, Joseph Hall, Manchester, England. The first baffle plate has a dome shaped head which deflects the gases to perforations in the flat portion. The course of the gases is changed three times before they exit.

Electric Horn, Adam Lungen, assignor to Edwards & Co., New York City. A diaphragm is struck by a spring vibrated by an electro magnet, similar to the manner of the vibrator of a coil.

Electric Lighting and Starting System, Charles E. Bonine, Philadelphia. Consists of a shunt and series wound motor-generator, and storage battery with aumatic switch.

Tire, S. T. Allen, assignor to Triplex Tire Company, Detroit, Mich. The felloe is surrounded by a resilient band around which are arranged interlocking T shaped members, reinforced by metal pieces and held by a flange.

Rotary Engine, Jules F. Bourlon, Everett, Mass. Cylinder is annular with a continuous slot in its inner periphery. The pistons are provided with flanges overlying the slot and explosion chambers are formed by movable abutments.

Pipe Wrench, H. R. Sinclair and Carl Ekman, Worcester, Mass. The gripping member of this is a strap held in a wedge shaped passage on the handle by means of a wedge.

MECHANICAL POINTERS for GARAGEMEN AND OWNERS

WHAT PITCH AND DIAMETER MEAN.

Despite the great amount of technical knowledge which has been disseminated by the rapid development of the automobile, and the corresponding spread of information pertaining to the complete machine and its parts, there are still a number of terms in common use which are not understood by everyone. Owners, operators and others do not know exactly what is meant by the terms "pitch," "pitch diameter," and the variety of names of dimensions and parts of gears and sprockets.

Very recently, in fact, within a few weeks, The Accessory and Garage Journal has received several queries relative to gears and gear parts. In answer to these inquiries, a short and simple explanation of these everyday matters will be attempted.

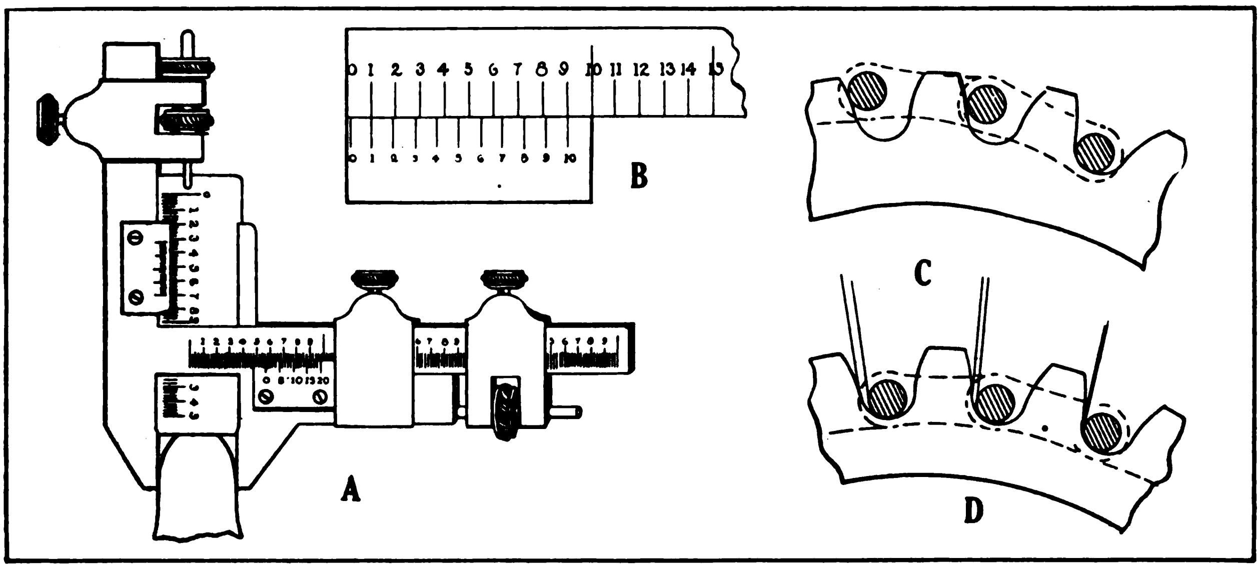


Fig. 1—Circular and Diametral Pitch of Chains: A, Micrometer Tooth Measuring Instrument; B, Vernier for Reading Fine Divisions; C, Worn and Stretched Chain Climbing Sprocket; D, Clearance Between Rollers and and Teeth with New Chain.

To begin with, the pitch line is a theoretical line drawn through the teeth of a gear or sprocket and this line is the perimeter of a circle having the same centre as the gear and concentric with it. When two gears mesh the teeth contact on this pitch line, which is about the centre, measuring from the top to bottom of the tooth. If a straight line be drawn from the centre of one gear to the centre of the other the pitch lines will be tangent to each other at the point they are intersected by this line.

The diameter of the circle formed by this pitch line is called the pitch diameter, and when reference is made to the diameter of a gear or sprocket this is always understood to be the one. There are also two others used in calculating gears; the outside and root (or bottom of the tooth) diameters.

Circular and Diametral Pitch.

The distance from the centre of one tooth to the centre of the next, measured along the pitch circle, is called the circular pitch and is obtained by dividing the circumference of the pitch circle by the number of teeth on the gear or sprocket. In gear construction it is essential to work with the diameter of the gears, a pitch being used that is expressed in terms of the diameter and this is called diametral pitch. It is not a measurement of distance but a ratio and consists of the number of teeth on the circumference of the gear for each inch diameter, and is found by dividing one by the other. For illustration: If a gear has 80 teeth and the diameter is 10 inches, 80 divided by 10 which gives eight, is the diametral pitch of the gear.

Roller chain dimensions include pitch, diameter of roller and inside width. In defining the pitch of a chain or sprocket, the circular pitch is used, this being the same as pitch of the sprocket. When a chain is placed on a sprocket the pitch line passes through the entre of the rollers and the pitch is the distance from the centre of one to that of the next.

Making Gears and Sprockets.

In the manufacture of spur gears or sprockets a blank is first turned in a lathe and then transferred to a milling machine to cut the teeth, a process requiring accuracy as well as care in the case hardening which follows. Gears are designed to have a small amount of clearance, or backlash, at their pitch line; that is, the space between the teeth at the pitch line is slightly in excess of the thickness of the teeth at that line.

This difference is but a few thousandths of an inch and a variation either by improper meshing or alignment results in excessive wear and noise. A micrometer tooth measuring device utilized for this purpose of estimating accurately the distance from top to pitch line, and thickness of teeth at pitch line, is shown in accompanying sketch, Fig 1, at A. The tongue moved at right angles to the jaws is set to the depth the pitch line should be from the top of the tooth, and the thickness of the tooth is measured by the sliding jaw. By using a vernier, which is shown at B, measurements are obtainable in thousandths.

Proper Meshing of Teeth.

The distance between the teeth at the pitch line on a sprocket is influenced by the rollers as the centre line of the roller must agree with the pitch line of the sprocket. Although gears of the same pitch will mesh, in fitting chains to sprockets the pitch line and roller diameter must be similar. Sprockets are constructed so that the rollers will enter and leave without friction, and seat. Provision is made for wear of the chain, otherwise it would climb and ride the teeth of the sprocket. Allowance is also made for stretching of the chain.

At D is shown a sprocket which is driving the chain to the right and the amount of clearance is designated by vertical lines. The roller at extreme right is leaving the tooth and the middle roller is gradually coming in contact with its tooth. The drive is being effected by one tooth, but as the chain stretches and wears, other teeth will participate in the driving. At C is shown a chain that is worn and consequently stretched. It will be noted that one roller is climbing the tooth and further wear usually results in the chain riding the sprocket and causing trouble.

Measuring Chain Sprockets.

Wear of chains is caused largely by the dust that is attracted by the oil or grease with which they are lubricated. This also applies to the teeth of the sprocket which wear is denoted by indentations of a hook-like appearance. Additional wear can be secured by reversing the sprockets, but a new chain will be necessary. If a new chain be needed the pitch may be ascertained by measuring from centre to centre of the rivets.

Another method is to make a tracing of the sprocket on paper, but it is not necessary to remove the sprocket on some types of cars. A template can be made by holding a sheet of stiff paper against the sprocket and the pattern can be cut by tapping with the ball end of a pein hammer. A hole should be cut in the centre of paper so that it will pass over the hub of the sprocket.

From the centre of the pattern scribe three circles; one around the outside through the points of the teeth, another through the root or bottom of the teeth, and the third between the first two, which will be the pitch line. With a pair of calipers measure from the front or unworn side of a tooth at the point where it is cut by the pitch line, to a similar point on the adjoining tooth. After calipering several and finding the distance is approximately the same, it may be taken as the pitch. The pitch of chains is measured by eighths up to one inch, and by quarters above that. The diameter of the rollers is equal to the height of the tooth or the distance between the root and outside circle. The inside width is the length the roller must be to allow side links to clear teeth.

Usual Clearance on Roller Chain Sprockets.

Pitch in inches	Clearance in inches	Pitch in inches	Clearance in inches
.50	.03125	1.50	.15625
.75	.06250	1.75	.18750
1.00	.09375	2.00	.21875
1.35	.12500		

Description of Vernier.

Reference has been made to a vernier, which is a device for reading finer divisions on a scale than those by which the scale is divided. One-sixty-fourth inch is about the finest division that can be read accurately by the naked eye. When fine work is necessary, the vernier is employed.

One division on the vernier is equal to .9 of one division on the true scale, consequently the difference equals .1 of the true division or when each of these is one inch, .1 inch. The difference at the second division is .02, at the third .03, and so on. If the vernier be moved until the third division coincide, it will have moved .03 inch. It is this principle that is applied to measuring instruments.

When graduated to read in thousandths, the true scale is divided into 50 parts to the inch and the vernier is graduated into 20 parts, each division on the vernier being equal to nineteen-twentieths of one on the true scale. If the vernier be moved so that the lines at the first division coincide, it will have moved one-twentieth of one-fiftieth, or .001 inch.

The following tables give the figures for converting diametral pitch to circular pitch and the latter to diametral pitch for all sizes from one inch up:

Table No. 1.

Diametral pitch, inches	Circular pitch, inches	Diametral pitch, inches	Circular pitch, inches
1.25	2.5133	11.00	0.286
1.50	2.0944	12.00	0.262
1.75	1.7952	14.00	0.224
2.00	1.571	16.00	0.196
2.25	1.396	18.00	0.175
2.50	1.257	20.00	0.157
2.75	1.142	22.00	0.143
3.00	1.047	24.00	0.131
3.50	0.898	26.00	0.121

SOME PULLEY HINTS.

The covering of a pulley is not a difficult task if handled properly, according to the American Blacksmith. First remove the old cover and renew the wedges if the latter be used. Select a piece of leather of good quality, a little wider than the member to be covered and three or four inches longer than will go around the wheel. Place the covering in luke warm water for an hour or so until it becomes soft and pliable. Square one end and nail it to the wedge, using nails just long enough to clinch as they pass through the wedge and strike the body of the pulley.

Then take a clamp of some kind, wood preferred, and apply to the covering; with a pry stretch the covering up to the next wedge and nail as with the first end. Continue this operation until the last wedge is reached, when the few extra inches left on the cover will come in handy in fastening the clamp. After nailing the end of the last wedge, cut to the proper length and trim the edges to the leather down to the rim of the pulley and the job is complete. In case wedges are not used and the covers are riveted onto the pulleys the same method will be found to be applicable.

In order that a pulley be keyed properly to a shaft a key must be of equal width its entire length, and fit the seats on the shaft and in the pulley very accurately. The thickness should vary just enough to make the taper correspond with that of the seat in the pulley. In driving the key it should be driven just tight enough so that it will not work loose. In most cases the hubs of the pulleys run against boxes, and keying these on, about .03125 inch should be left between the box and pulley, for in driving it tight up against the former it would have a tendency to heat and reduce power. In case the key is too thin, but fits otherwise quite well it may be made tight by inserting a strip of tin between it and the bottom of the seat in the pulley.

Polish for Varnished Work—To renovate varnished work make a polish of one quart of good vinegar, two ounces butter of antimony, two ounces of alcohol, and one quart of oil. Shake well before using.

TRUING CRANKSHAFT BEARINGS.

Sometimes the repairman whose machine equipment is limited to an ordinary centre lathe is called upon to remove scores and true up a crankshaft, and the following method is recommended by the owner of a small shop: Place the crankshaft between the lathe centres, then fix a tool in the slide rest and run the latter up into line with the main bearings. The point of the tool is next moved just clear of the forward bearing, at the same time pulling the lathe belt in the reverse direction for cutting, so that the point of the instrument will not injure the shaft. If the latter be revolved at a good rate, the slightest deviation will be noted in the space between it and the tool.

If the shaft be somewhat out of true, it may be advisable to take a slight cut off it, and afterwards smooth up with a file and emery cloth. If it be scored but slightly a smooth file and emery will be sufficient. For the large end bearings an alternative is to lap them with emery cloth and oil placed between a wooden clamp as shown at Fig. 2 D. The device consists of two pieces of wood about the same width as the metal, and of sufficient length so that when in operation the cranks, as they revolve, will not touch the ends.

Each section of the wood is bored to suit the diameter of the work, and a small leather hinge utilized for the purpose of coupling the pieces together. The emery cloth is inserted inside the hole, and the clamp attached and held, running the lathe at a medium speed. The emery will reduce the unevenness of the metal. Should the bearings be a little oval, the highest points will no doubt be found on the sides, owing to the thrust of the connecting rod which causes the top centres to wear. In such cases the high point on the shaft should be eased with a file. In using the lapping tool care should be taken not to squeeze it too tightly as the emery will score the metal.

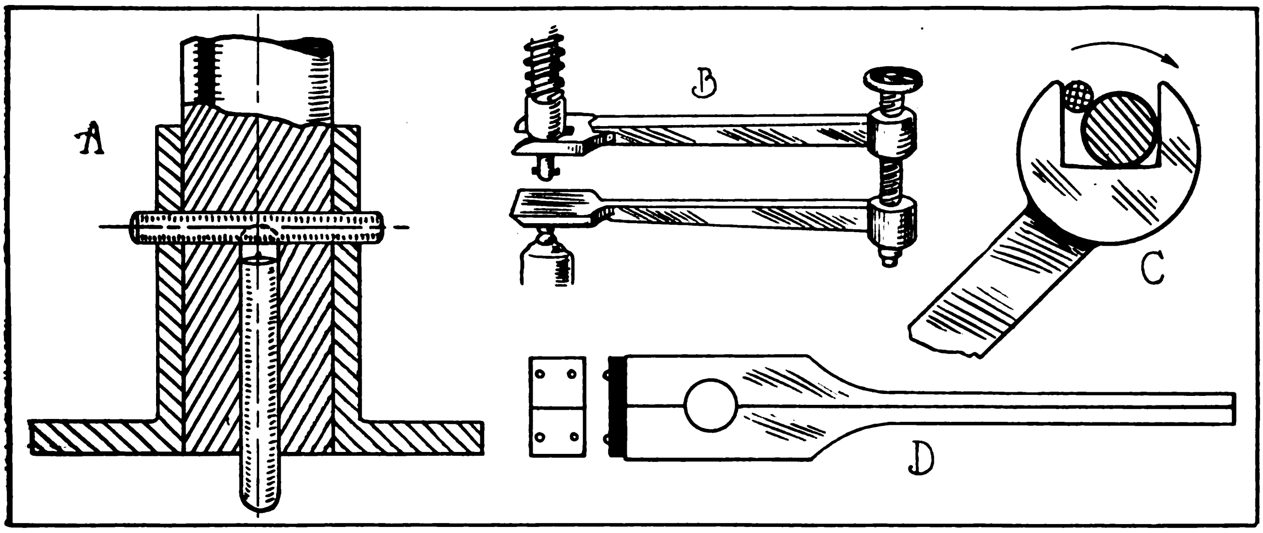

Fig. 2—Some Repair Shop Hints: A, Method of Swelling Shaft to Retain a Coupling; B, New Type of Valve Lifter; C, Utilising a Wrench and File to Remove Broken Studs; D, Lapping Tool Applicable to the Lathe in Smoothing Up Crankshaft Bearings.

TIGHTENING A LOOSE COUPLING.

A repairman was called upon to fix a coupling which originally had been shrunk on a gearshaft and had become loose. The member was removed from the gearbox and a taper hole bored up the shaft to a depth of about two inches as shown at Fig. 2 A. The taper was one of two degrees, and the hole at the end was .5-inch bore. A cast steel pin was then turned of such dimensions that it would only go into the opening for about .75 inch. The shaft end and coupling were then heated to a dull red, the taper pin inserted and given a sharp blow with a hammer. This caused the former to enter for about 1.5 inches, which swelled the shaft to such an extent that it gripped the coupling quite firmly.

INEXPENSIVE COTTER PULLER.

When one of the jaws of a straight wrench becomes broken the usual practise is to throw it into the scrap heap. Some of these tools may be made into a handy cotter pin puller with very little trouble. If the broken jaw be ground off flush with the recess, and the good part down to a long, slim point, the rocking motion that is given to the tool by the shape of the jaw will make removing cotters easy.

MAKING THE VALVE CAPS TIGHT.

In some cars the valves are as large as they can be made, and consequently the seating for washers is reduced to a minimum, and only narrow section members may be used, difficulty being experienced in making the valve caps compression tight. Several ingredients will bring this about, but when the members have to be removed heat may be needed before they can be loosened.

An excellent mixture is that of turpentine and flake graphite and if the washers and members be smeared liberally and tightened, they will not leak and may be taken out easily. The material may be used to paint the exhaust manifold. This is accomplished with a piece of waste dipped into the mixture and rubbed over the metal when the latter is hot. It will impart a beautiful polish to the pipe.

NEW TYPE OF VALVE LIFTER.

A new type of valve lifter has been brought out by an English concern as illustrated at Fig. 2 B. It consists of two arms, one of which is flat and the other slotted. The latter is placed under the valve spring retainer and is lifted by turning a small wheel which is fastened to a threaded bolt.

TESTING SOLDER.

To ascertain whether solder is of good quality, hold it up near the ear and bend it. If it cringe or make a crackling noise, it is good; otherwise it is an inferior grade. It can be made by melting equal parts of block tin and lead in a ladle. It should be stirred and run off into a mold to cool.

NEW GASOLINE FILTER.

A new gasoline filter and one that is claimed will absolutely separate every particle of foreign matter or water from the fuel, has been brought out abroad. The device, which is depicted at Fig 3 A, in outward appearance is similar to the ordinary filter, and has two pipes leading to it, the one at the right in the drawing being the supply tube. This extends downward below a cone-shaped gauze attached to which is the tube conveying the fluid to the carburetor. The fuel enters below the strainer and passes through this and the outlet.

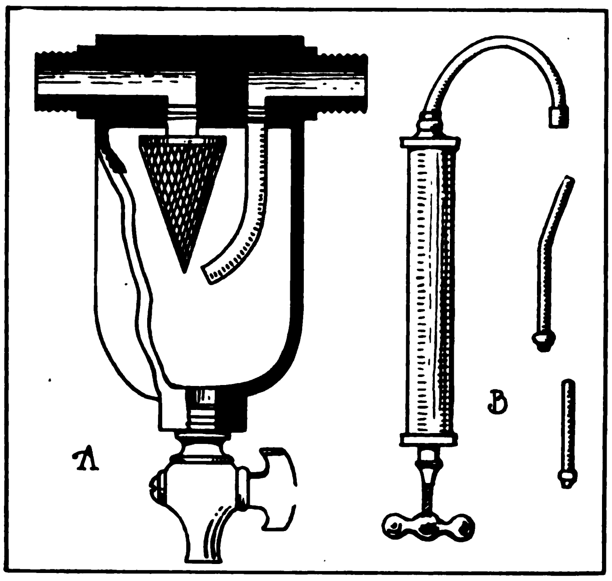

Fig. 3—A, New Form of Fuel Filter; B, Grease Gun Fitted with Flexible Nozzles.

FLEXIBLE GREASE GUN.

The design of some machines is such that it is difficult to insert lubricant with the ordinary grease gun. A new device which permits inaccessible places to be reached easily is being marketed as outlined at Fig. 3 B. It consists of the usual grease pump but is fitted with flexible nozzles which facilitate the operation. These members are made in sections and can be screwed together, forming a long connection. The instrument is made so that either oil or a grease may be used.

MOTOR KNOCKS AND SPARK PLUGS.

With the general use of the magneto as the chief component of the ignition system some repairmen having had long familiarity with the trembler coil are careless about the gap at the points of the spark plug. One workmen with a long and varied experience of cars and their peculiarities was puzzled by the eccentric running of a four-cylinder motor brought into the shop by a customer. The engine was very difficult to start, and when under way ran without balance, as if two cylinders were developing about double the power of the others.

He verified the compression, tested for auxiliary air, overhauled the magneto, etc., and finally confessed he was baffled. As sometimes is the case, a repairman from a neighboring shop walked into the garage and quickly solved the problem. Picking up the spark plugs, he set the gap of each to an accurate measurement. When replaced the motor ran perfectly. Ordinary spark plugs had been fitted and three of the electrodes of these had been burned away by the hot spark, increasing the air gap and causing the erratic operation of the power plant.

FORCING RACES IN PLACE.

Removing ball races on certain types of cars is sometimes a difficult task, especially when the members are a drive fit and have been worn through so that a recess is present in the shell or housing into which they set. The writer recalls a machine of 1907 design which was brought into a repair shop with one of its front wheels wabbling and upon examination it was found that the balls had crushed through one section of the race and into the supporting member.

Considerable difficulty was experienced in removing the worn part as it was of hardened pressed steel. By judicious use of the cold chisel it was chipped out without much damage to the housing, but when an attempt was made to fit the new race it was found that it could not be driven in without danger of breakage. The seat was smoothed up by removing the ridges and the metal ground off slightly to start it in its seat. A bolt, threaded at both ends to take a nut, and two .25-inch metal plates, were utilized as shown in Fig. 4. The race was drawn into place by tightening the nuts, and it was forced in straight as an even pressure was brought to bear.

Sometimes it is not possible to drive out the part or break it and when such is the case the temper will have to be drawn and a series of holes drilled after which removal will be an easy matter. If it can be started by driving sufficiently to enable the placing of a small piece of metal between it and the seat, a few smart blows of the hammer on a cold chisel will fracture it.

In replacing worn bushings of brass or bronze with new ones the usual method is to drive them in with a hammer and block of wood or lead. If it be a snug fit and the place inaccessible there is danger of burring up the part, also of its not going in true. They can be forced into place by utilizing the bolt and washers as outlined in the sketch.

SECURING WOOD SCREWS.

Wood screws are utilized in the construction of automobiles and sometimes they work loose, especially in the body. When such is the case they can be prevented from turning by using a small staple such as is employed in fastening wire netting. The staple is driven into the wood in such manner that the flat part of the former enters the slot in the head of the screw and locks it securely.

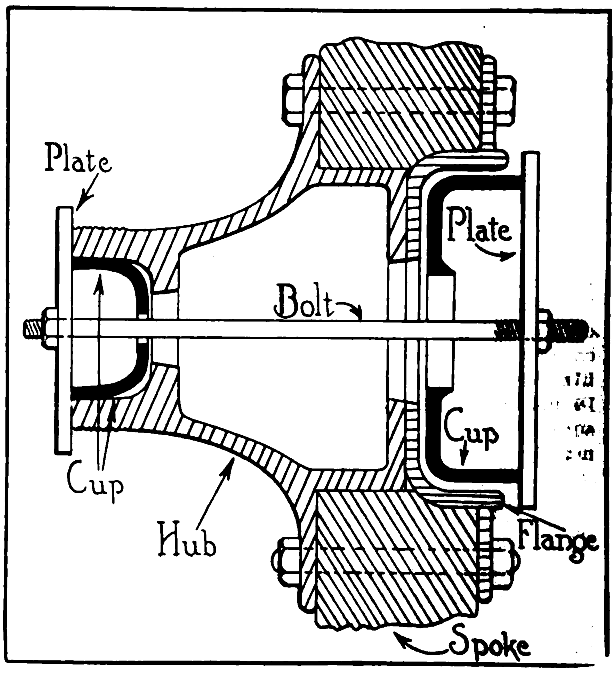

Fig. 4—Utilizing a Bolt to Draw Ball Race Into Wheel Hub.

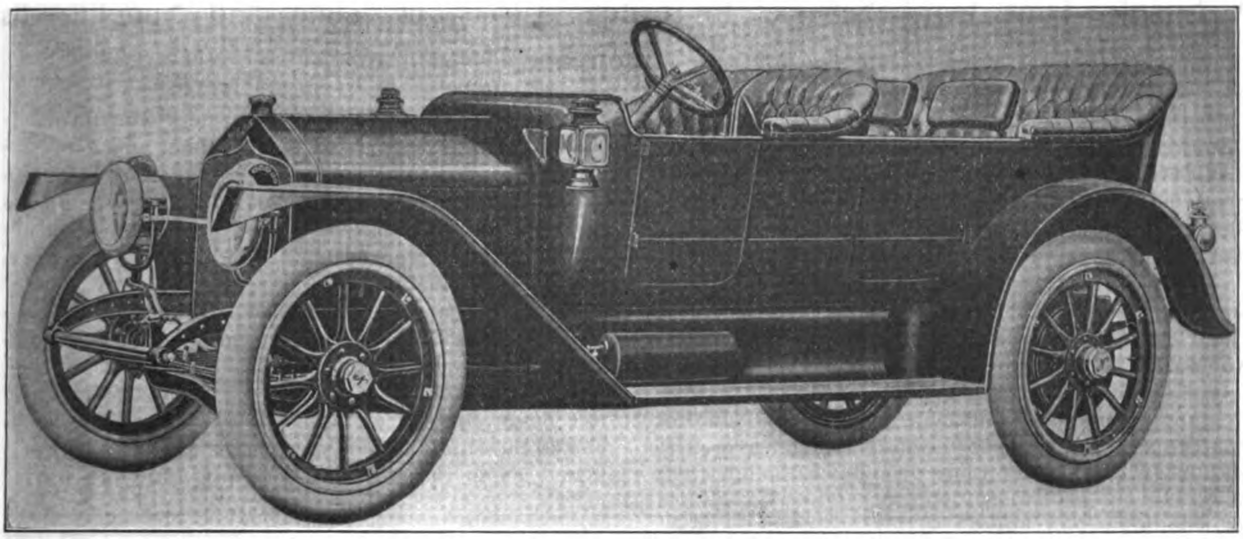
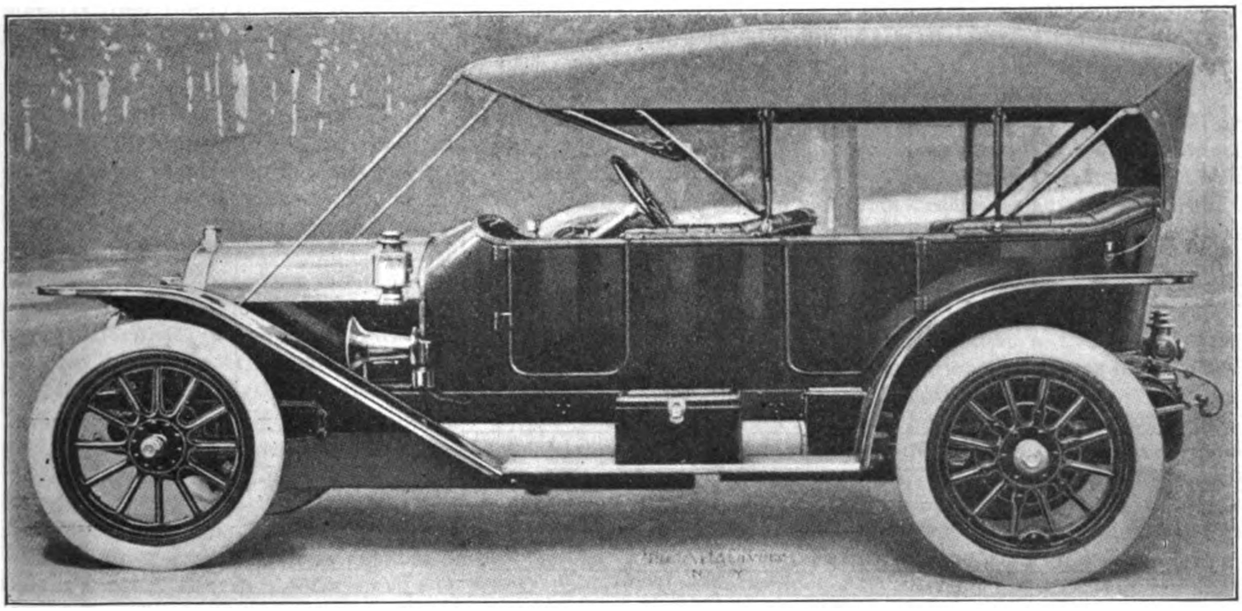
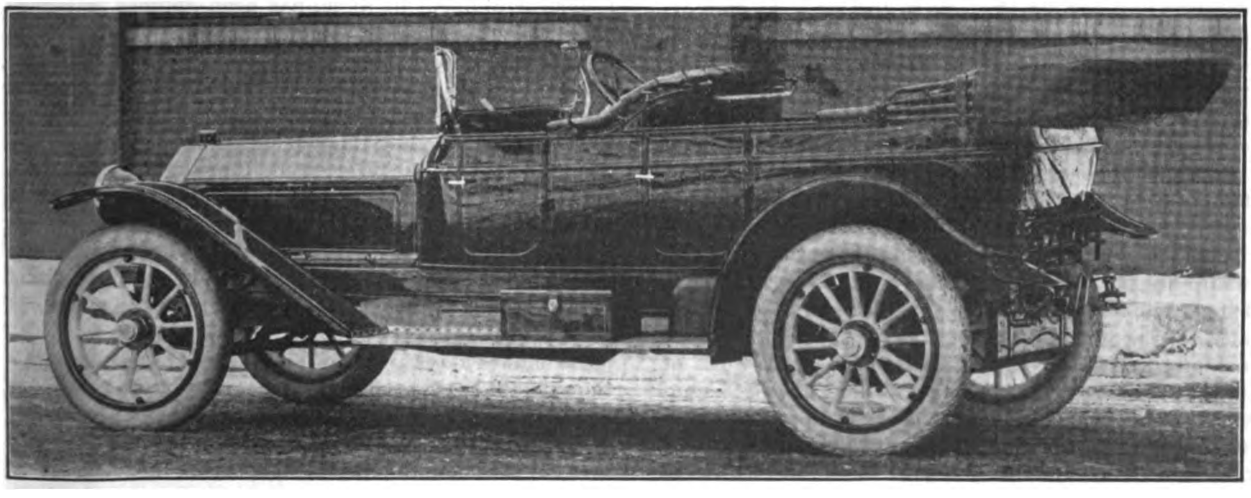
ATTRACTIVE LINES FOR LIVE AGENTS.



Seven-Passenger National 40 Touring Car Equipped with Four-Cylinder 40 Horsepower Motor—Price, $3000. Made by the National Motor Vehicle Company, Indianapolis, Ind.



Mercer Four or Five-Passenger Touring Car, Type 35, Series A and B, Known as the Newport Model. Horsepower, 32.4; Price, $2750.



Peerless "48-Six" Touring Car—Motor, Six-Cylinder; 48 Horsepower. Made by the Peerless Motor Car Company, Cleveland, O. Price, $5000.

SYSTEM FOR A SMALL GARAGE.

A Simple Time Card Scheme to Catch Leaks in Time and Supplies---Its Benefits to the Shop and Customers.

With the rapidly increasing number of motor cars in service, both for pleasure and business purposes, means must be provided for their care and maintenance. There is and always will be a demand for repair shops employing skilled workmen and in this respect it may be stated that the small shop, when properly equipped, may compete successfully with the larger and more established concerns. Many of the latter began operations in a small way with one or two workmen and through diligence and practical methods built up a profitable business.

Many competent workmen, thoroughly familiar with the motor car and its needs, have endeavored to establish a business of their own but although their work was entirely satisfactory to the trade as employees, they have failed to attain success in their new venture because of a lack of executive ability. Four or five skilled mechanics might decide to establish a repair shop, and while capable of undertaking and completing successfully any work, might fail to hold their trade because of a number of reasons, some of which will be outlined herein.

Fig. 1—Depicting Time and Labor Checking System, Showing Start and Finish of Work, Reverse Side of Card for Material, and Tag for Workman Called Off to Attend Another Customer—It Will Be Noted That Each Minute Is Accounted for by the Time Stamp.

Example of Failure.

Assume that three expert repairmen form a partnership in the repair business. One is particularly efficient upon motors, while the second makes a specialty of the components of the chassis, is a skilled machinist and fully capable of handling any work of this nature. The third member of the firm is a general all-around man, clever at locating motor car troubles as well as proficient with ignition and carburetion. Such a combination should be able to establish a paying business.

It is natural to presume that the nucleus of the new trade will consist of those owners who have followed the workmen from their former place of employment. Personal solicitation and friendship also proves a valuable asset in securing a large clientele and in a short time the new firm appears to be established upon a sound basis and its members are working overtime, including Sundays.

Leaks and Overhead Expenses.

To reduce the overhead expenses as much as possible the new concern dispenses with a bookkeeper, one of the firm filling the office, the only salary paid out being that of an apprentice who runs errands, cleans the cars and acts as an assistant to each workman. From the start the company, although having a good equipment of tools, has been obliged to secure supplies and material which makes deep inroads into the capital.

At the end of the month the firm proceeds to take an account of its financial standing, and although the books show that the business for the month has been all that could be desired, there appears to be a shortage of ready cash, and it is probable that one member of the company will begin to compare his financial standing with that of the past when on Saturday he received his envelope with its regular sum of money and frequently its contents were swelled by reason of overtime.

A month later the firm discusses its business. Although all have been working overtime to turn out the work and new customers have been secured, after paying the lighting, power, telephone and supply bills, it may develop that the amount of cash available when divided into three parts, proves to be a small salary and particularly discouraging when the overtime labor is taken into consideration. The books show a handsome profit, but many of the outstanding accounts are hard to collect and several are discovered to be almost worthless.

As a result the clerical member of the firm takes an account of supplies and goes through the books and begins to check up material and compare that on hand with that charged. He is apt to discover that there are many leaks. The books show that during the month 500 gallons of gasoline were purchased and that 200 were charged up. The tank reveals but 250 on hand, leaving 50 gallons unaccounted for. The oil question is next looked into and a similar discrepancy discovered. Other supplies also show a balance on the wrong side of the ledger, small amounts it is true, but when figured on a yearly basis they total a considerable sum.

Lack of System.

The bookkeeper decides to check up stock at the close of each day. It has been customary for each workman to make up his time slip and material account at night, relying upon his memory for details. Taking each slip the bookkeeper compares the charges with stock of fuel and oil and discovers a shortage of five gallons of gasoline. One member of the concern recalls having put this amount in Mr. Blank's car. Another refilled the crankcase of a motor and told the boy to enter it at the office. Another sold a gallon and put the change in his overalls. Although each member resolves to remedy the faults, the errors occur frequently, eating into the profits.

The new concern also learns that considerable diplomacy is required in handling customers and that some of its trade is taking work to other shops, the result of one member completing work ahead of another customer whose car should have been turned out first. Work promised is not delivered on time, creating dissatisfaction, as well as numerous other minor difficulties which could have been avoided if the firm in its anxiety to please had been more conservative in its estimation of time and labor.

Need of Management.

A small concern operating under these conditions will not be successful, unless one member possesses executive ability and the others agree to conform to his orders, discussing each step before it is taken. While such a combination is capable of accomplishing satisfactory work, it must have the proper management. The same workmen, when employed under a capable foreman, in a large shop, observe the rules and maintain the system in vogue. They have their instructions and follow them.

The writer personally knows of cases where a skilled repairman established a shop of his own and for a while was very successful, but failed to hold his trade because of his lack of executive ability and diplomacy. Unconsciously he favored certain customers, which was noted by others who naturally became dissatisfied. This same workman, who later became identified with a large concern, was one of their best employees, giving perfect satisfaction to customers he failed to please when in business for himself.

Labor and Check System.

It is conceded by those familiar with the operating conditions of the repair shop employing two or more workmen that more or less difficulty is experienced by the proprietor in keeping an accurate account of the time and material utilized by the employees. This is meant to apply to the shop not equipped with a system, and which is experiencing a steady growth of business compelling the owner to add to his force from time to time and especially during the busy season.

Under such circumstances the new men are prone to emulate the example of the older employees in making up their time at the end of the day's work, which if it consist of 10 hours results in like number being charged up to one or several jobs as the case may be. Material and stock is charged in a similar manner. Operating under such conditions is bound to be costly to the proprietor in more ways than one.

Faulty Time Keeping.

Not only is the workman liable to forget minor charges, but if he is called upon to work on a number of jobs during the day he cannot very well remember the exact amount of time on each unless possessing a wonderfully retentive memory. If the workmen compute their time at the completion of the day's work, they are interested only to the extent of accounting for 10 hours' labor, a method which may be satisfactory to the proprietor, but not to the discriminating customer.

For example: Mr. Brown brings his car to the shop to have the valves ground and wants his machine that afternoon. Being a good customer and the work permitting, the job is promised, and Mr. Brown sees the work started. An hour afterward he passes the garage and notes the same repairman working on a car in the street. Repassing the place still later he finds the street job is not yet completed. That afternoon Mr. Brown gets his car and asks for his bill. He notes the time for labor and does a little figuring and is of the opinion that he is paying for some of the other owner's work. An investigation results in the workman "remembering" working on the other car. The bill is corrected, but Mr. Brown is developing an idea that he has not been given a square deal or else that the shop is not conducted in a business manner.

Sometimes it happens that a customer disputes the amount of labor on a job and demands an itemized account. These little difficulties are not uncommon and often a recourse to the courts is had to obtain an adjustment. Although to be regretted, it is a fact, nevertheless, there are many arguments over repair bills which might have been avoided if the shop maintained a system by which the owner could be shown an itemized account of the time and material, also that he could not be charged for labor not his or due to the absent-minded or careless workman.

Such a system should include means for checking the time of the workman hourly and in fractions thereof, as well as for all material and stock utilized. In large shops cards or sheets with duplicates are employed and the small details looked after very carefully. In the event of disputed work the records are valuable as evidence.

Many shops hesitate to install some systems because of the expense and necessary clerical labor involved. With small garages, employing three or four men, the proprietor may keep the books and attend to many small details usually looked after by the bookkeeper, etc. With such a concern the system should be as simple as possible yet provide accurate means for checking up the labor and material.

Clocking System.

At Fig. 1 is outlined a system which would not be expensive to install, and in addition to keeping an accurate account of the time spent on each job, would serve also to check up the time of the workmen; that is, denoting the time they began and finished each day. It requires a form of time clock which provides for stamping the month, day, hours and minutes, a device employed by many firms to register the time orders or letters are received and answered. This clock is located in or near the office and is fitted with a rack for each workman, also another holder containing blank cards.

Assume that Dr. Wilkinson drives up to the shop and makes arrangements to have his motor overhauled. The proprietor instructs Smith to start on the job the next morning. Smith is given a copy of the orders entered upon the order book, and upon arrival the next morning takes a blank card and stamps it in the clock device. Smith was late that morning, and the "started" side of the card shows he began work at 8:28. At noon he stops, stamps his time and leaves the card in his rack, restamping it upon his return.

At 2 he is called off by the foreman to do a little work on Mr. Ducharme's car, who has just driven up. Smith goes to the time clock, stamps his card, places it in its holder, takes a new card and stamps it at 2, and enters Mr. Ducharme's name, the type of car and its number, before proceeding to work. At 3:58 he completes his task, returns to the clock and stamps the card denoting that the work was finished at that time. He also stamps the card bearing Dr. Wilkinson's name at 3:58 and resumes work on that job, but leaves Mr. Ducharme's card in the rack. At the completion of the day's work at 6 the card is again stamped and left in the rack from which it is taken by the bookkeeper, entered on the day book and replaced on the clock.

The reverse side of the time card is utilized for entering the stock and material used, the prices of these being carried out and added up by the bookkeeper, and entered in the day book or ledger. The total time is figured easily as well as that of the workman. Upon the completion of the work the card is taken into the office, entered and filed away for reference.

By utilizing a separate card for each job, whether it be for 15 minutes or several days, the customer is assured that some other owner's car is not being repaired at his expense. In the event of a workman requiring the aid of another for an hour or fraction thereof, the time card will show the double time and how utilized. Should the customer desire an itemized bill of the labor, it is made up easily. One time card could be employed for a job taking several days or a separate one utilized each day as desired. The system could be made to fulfill a number of requirements and to make it successful it would only be necessary to insist that each workman use a card in connection with the clock upon starting and completing each job, as well as for working hours.

BUSHING PULLEY WITH BABBITT.

A repairman had a 24-inch pulley with a 2.375-inch hole that he desired to use on a 1.1875-inch shaft. Not wishing to wait until an iron casting could be made he laid the pulley, rim down, on the planer table. A short piece of 1.1875 shaft was faced off square on both ends and stood up inside the hole, and a clamp put on the top to maintain it in place. The shaft was then squared with a try-square and a bar of straight steel laid across the upper rim face of the pulley. The pulley was then shifted until it was concentric with the shaft, as near as could be measured with a scale, and clamped. The set screws were turned down until just in contact with the shaft, and the hole filled with babbitt. The pulley ran true within .03125 inch and with the screw holes all tapped. Although not made for a durable job it gave good service for over a year.

DRILLING HOLES IN LEAD.

Drilling holes in lead would appear to be a very easy matter as the metal is soft. However, unless the proper lubricant is employed, where the hole to be made is of any depth, a ragged burr will be thrown up around the top of the aperture which will be thrown out of shape by the "crawling" of the chips. A good grade of lard oil and plenty of it should be utilized and the drill should be lifted one or more times to clean out the chip. With power a speed of 800 revolutions a minute should be employed.

NEW TYPE OF DRY BATTERY.

A new type of dry battery being introduced abroad is said to have a useful life up to three years or more, as it does not deteriorate when not in use, also it will retain its charge for several years. A feature of its construction is that it will permit of recharging several times. A number of zinc plates are utilized for the negative element and for the positive a carbon rod is imbedded in a composition of charcoal and manganese oxide, surrounded by a mixture of ammonium chloride, chloride of lime and zinc chloride. These elements are placed in an electrolyte consisting of amylon, obtained from the sago palm, with exciting salts composed of platinum-ammonium chloride and zinc-ammonium chloride. This electrolyte, which is in the form of a jelly, is claimed to retain its moisture for long periods and to be but little affected by variations of temperature.

CUTTING THREADS ON SMALL SCREWS.

In many shops only long machine screws are carried in stock and when a short one must be used the threads are cut up to the head and the extra length cut from the thread end. When this is done by holding the screw in a vise and using cutters or a hack saw to cut it, considerable filing is necessary to restore the threads to their original shape. If the following method be utilized, this filing is not needed:

A die the same size as the thread is fastened into the holder and the stock clamped in the vise. The screw is threaded into the die, a screw driver being used to force it through, cutting the threads on the shank. After cutting off the extra length the screw is backed out, the die forming the threads back into shape.

At times the screw will twist when cutting threads on the shank especially the smaller sizes. This can be prevented by catching the threaded end in the vise after starting the die and holding the head from twisting with a screw driver while the die is being turned.

SMALL FILE HANDLES.

"Sparklet" bulbs, which are generally thrown away, make excellent handles for small files. The file is held in a vise, the tang uppermost, and the empty bulb driven on with a wooden or lead mallet. If desired, the bulb handles can be lacquered over with brush enamel, to prevent their rusting.

PAINT INDICATING TEMPERATURE.

According to Tollner, a paint that is red at ordinary temperatures and turns black at about 140 degrees Fahrenheit, returning to its original color on cooling, is made from 100 parts each of iodide of mercury and iodide of copper rubbed down carefully with sufficient distilled water to form a spreadable paste.

VALUE OF SPECIALIZED PUBLICATIONS.

Prints of Established Policies as Contrasted with Those Transformed to Meet Publishing Expediency and to Reap Profit in Apparently Promising Fields.

PUBLICITY is sought by the concern or individual primarily because of a desire to promote business. It is assumedly obtained in whatever form will bring the largest measure of results, the medium being chosen after consideration of those available, logically with a basis of economy so far as expense is concerned. While it is not probable that every anticipation is realized there is at least reason for the advertiser to believe that he has received the service he has purchased. In other words it is not always possible for all the results of publicity to be known because of the continuity of business and the fact that transactions resultant from the one notification to the public may be consummated a considerable length of time after publication.

The actual worth of a publication to the publisher is the degree of confidence he has established with business men. This must be based upon the class and number of readers. The fact that prints are devoted to different classes and their interests is the best evidence that no one can serve all. Were this condition reversed there would be only the general newspapers and periodicals. Specialized papers and magazines are not creations for the purpose of deception, but are distinctly developments because of demands not previously supplied.

Just as this condition may be applied broadly it may be specifically stated with regard to industry, to commerce, to the professions, to the arts, to politics, to religion and to science. It may be even further classified. It is not strange that there should be specialization with reference to the motor vehicle industry and trade, and to the promotion of the use of these conveyances. To the contrary it would be very strange were this specializing neglected. But it must be understood that establishing the specialized print is an undertaking of no small proportions, which cannot be accomplished save through bringing to the attention of a class the merits of the publication, and a reputation and prestige once obtained, are too valuable to be sacrificed or neglected. No print of value was ever created in a brief period. Confidence is imperative, and this cannot be acquired save through experience.

There is manifested in publishing today at least the same progression evidenced in other industries. It is true that all have not adopted the same policies and appeal has been made to differing interests. But it is a fact that in the early days of the automobile industry publicity was sought by inventors and manufacturers without much regard for the medium. Then it was necessary to convince the people the mechanical vehicle was practical and perhaps all intelligence served a useful purpose. Prints were then utilized purely for promotion of what was regarded as a pleasure or sport. The public was excited by thrills and "stunts." Competitions were one of the most generally adopted means for attracting the attention of the people.

In the evolution of the industry and the adoption of the automobile vehicle generally it is not to be assumed that the methods originally the vogue were unchanged. With development and expansion the interests were widely extended, until today hundreds of manufacturers, and thousands of selling representatives, to say nothing of those more or less identified with the care and maintenance of cars, as well as hundreds of thousands of vehicle owners and users, may be regarded as the clientele of the publications directly devoted to motor vehicle production and service. And just as these interests are diversified and extended over the nation so is the need of the prints that are specialized for their direct promotion. No one magazine can serve all, even indifferently. No one can, as a business proposition, expect the support of what it does not indorse or promote. As the industry broadens the greater is the need of specialization.

The value of the specialized publication was discounted by publishers who depended upon their personality for advertising patronage; by those who believed that the advertisers would bestow favors and continue the support of whatever might be considered promotion; by those who did not understand that any enterprise must be conducted to recognized principles and to business methods; by those who failed to realize that the strength of their own proposition was what they made it; by those who did not see the possibilities through public recognition.

Within a comparatively brief period the endeavors of some of the publishers of prints to obtain patronage as a specialized publication have not only attracted attention through the industry and trade, but the spectacles have assumed more or less a humorous phase because of the absurdness of the claims made. For instance, a magazine that was decidedly emphatic in its contention that it was devoted to the industry, after an existence of years, suddenly became an owners' publication, it being maintained that the circulation that had been gained in one field could be continued in another in which it had made no attempt to secure subscribers. Quite as remarkable was the lightning change made by a publisher who took over a magazine that was claimed to be an owners' print, and with one announcement he transferred its clientele to the "trade" and a hoped-for increased patronage. Not only this, two magazines that had for years boasted of owners' subscription lists made headlong plunges into a "trade" policy that undoubtedly firmly established their values without regard for the subscribers.

There is usually some reason to doubt a statement not supported by fact, yet the public is expected to believe that as a publishing proposition a publication can change its subscribers at will, and have equal or greater strength than before. Logically there can be but one conclusion, and that is the publishers hoped for greater profit, and any reversal of policy must be a confession of weakness or failure. Besides, if success could not be gained in one field after long and continued endeavor it is difficult to reconcile the statement that attention to another class has accomplished it through a mere announcement. One might say that a pleasure car was a truck, but it would be difficult to convince a purchaser that the argument was well founded. Publications may change their policies, but it is evident enough that there must be a sufficient period of development to establish a strength and support. Instantaneous transitions do not inspire confidence when it is understood that with any reputable print the advertising value is based entirely on the number and character of its subscribers.

Perhaps it might be wise to consider the subscribers for a moment. It is certain enough that those who are owners have no concern in matters relating to the industry and the trade. They have undoubted interest in subjects relating to their own pleasure, which are not in the slightest degree of a trade character. It might be that the trade would have a casual concern in whatever would indicate public demand or sentiment, but aside from this the magazine for the owner would be a matter of indifference to those engaged in trade.

The value of the specialized magazine cannot be too highly estimated by the industry and the trade, but it is idle to assume that the interests of each class represented can be equally well served by a single publication. It was recognition of this condition that established The Automobile Journal as a magazine devoted to the owners in the broadest sense. As the demand became apparent the Motor Truck was published for the promotion of the use of the service vehicle, there being a careful attention to details of a character that has caused its recognition as an authority. The proportions of the industry and the trade, and the necessity of a medium for the dissemination of industrial and trade intelligence, impelled the establishment of the Accessory and Garage Journal.

These publications have been developed to carefully determined policies. The lines of demarcation have been well established and the three prints have been given over to separate and distinct fields in which the interests are large and are increasing.

The distribution of these magazines has been developed wholly upon their value to the subscribers. The contents have been prepared with special reference to the readers and the subjects have unusual interest. No opportunity to improve has been neglected. The development has been always with a view to giving publications that are worth to the readers more than the prices charged. It has never been necessary to promote them with gifts, premiums, extended subscriptions, and other inducements, which, while possibly regarded as free by those receiving them, must be paid for by the subscribers.

It might be well enough to emphasize that instead of changing the policy of any magazine and directing attention to any particular interest, and claiming especial influence with that clientele, these fields have been regarded as each requiring separate publications. That is to say, instead of policies to justify the endeavors of advertising solicitors, without quality of contents to support any logical argument, these magazines have been devoted to the interests of the subscribers, constantly and consistently; instead of policies dictated by expediency, or to temporarily meet the competition of another print, and the claim that a distribution was to any particular class an advertiser desired to make appeal to, the magazines were strengthened with reference to those for whose benefit they are published.

The Automobile Journal has always been devoted to the interests of the owners of pleasure automobiles. It has always been given over to subjects concerning them and their pleasure. More than 90 per cent. of its distribution reaches owners direct. The influence of the owner with his associates is the most potent factor in the legitimate promotion of the use of the motor car.

The Motor Truck is generally promotive of the manufacture, sale and use of the service wagon. It is a reflection of practical conditions in that it deals with experiences and actual usage, with all types of transports, affording information that is not only exceedingly valuable, but is obtainable in no other form save through personal investigation. It is an authority from every point of view and is so regarded by every interest, while its influence is world wide.

The Accessory and Garage Journal is distinctly a trade publication. It is the only print of its kind in the country, for it is devoted exclusively to the motor vehicle and allied industries and the trade. The information it contains is the specialized intelligence that cannot be obtained through other channels. It is a dependable authority because all facts are verified.

All advertising in any of these three publications under yearly contract are listed, with name, address and branches, under appropriate classification in the Buyers' Guide or Trade Directory published in each magazine, without additional charge. This list is not vague or uncertain. It is select from every point of view, giving every reader a reference revised with each issue, composed of the best and most representative firms producing or distributing vehicles, accessories, supplies or equipment. Practically everything desired may be obtained should there be no personal representative. Instead of the general trade directory with names of thousands revised several times a year, and reaching a comparatively small number, this list is given 48 revisions annually, and besides the circulation in the magazines is included in the series of 10 standard automobile mechanical handbooks, of which more than 300,000 were published last year. The circulation of the directory will reach more than 850,000 the present year, without considering the phenomenal increase in the sales of the handbooks during 1912.

The Trade Information Exchange conducted by the Accessory and Garage Journal is a buyers' and sellers' confidential service, free to all automobile dealers, accessory and supply dealers, garage and public service station owners, and repairers, regularly subscribing to the Accessory and Garage Journal, and to all concerns listed in the Buyers' Guide published in The Automobile Journal, Motor Truck and Accessory and Garage Journal. It is the only service dealing with information of the motor vehicle and allied industrial and trade interests. It places the purchaser in possession of accurate and dependable facts relative to any condition of all the trade, and it affords the producer or distributor the same selling knowledge of the entire market instead of a few channels for distribution. This exchange was created for the benefit of the interests specified and its fullest resources are at the command of its members as frequently as they care to avail themselves of them.

TITANIUM FOR STEEL.

Titanium promises to be largely used in the steel parts of automobiles, according to B. C. Spitzley of the Abbott Motor Company, Detroit. It is now being used in steel rails with excellent results, the New York Central having found that such rails in service lost in weight but one pound a yard when ordinary steel rails lost three pounds a yard. The titanium rails are tougher and have a higher tensile strength than rails of ordinary steel. The cost of treating steel with titanium is but 75 cents a ton, and the increase in tensile strength amounts to 20 per cent.

MAGNETOS FOR GAS ENGINE SERVICE.*

Principles Involved in the Design of Standard Instruments, Features of Construction and Conditions Essential to Efficient and Continued Operation of This Generally Adopted Source of Electric Energy.

(Continued from April Issue.)

Continuing the description of the Eisemann magneto, the high-tension current produced in the secondary winding of the armature is supplied the collecting ring mounted on the driving end of the armature shaft, and protected from contact with any of the surrounding metal by a vulcanite spool. A carbon brush bears against the collecting ring and the current is then conveyed by the metal brush holder, which is also insulated by a vulcanite bushing through the conduction rod leading to the rotary distributing finger in the secondary distributor. This member contacts with the different segments to which the sockets for the plug jacks are connected. It will be evident that the bearing at the driving end of the armature shaft is a bronze bushing and that the distributor also runs on a long plain bearing. The safety spark gap is mounted at the driving end of the instrument and is housed on the armature cover plate extending over the pole pieces. One terminal of the safety gap is attached to the cover plate bridging the poles and is thus in direct electrical contact with the ground; the other, which is carried at the top of the device and insulated from the surrounding metal by an air gap below and by a vulcanite cover in which it is imbedded, is coupled to the connector bar joining the high-tension collecting brush and the revolving distributor finger. The terminal at the front end of the contact breaker cover is the member to which the ground wire leading to the switch is attached.

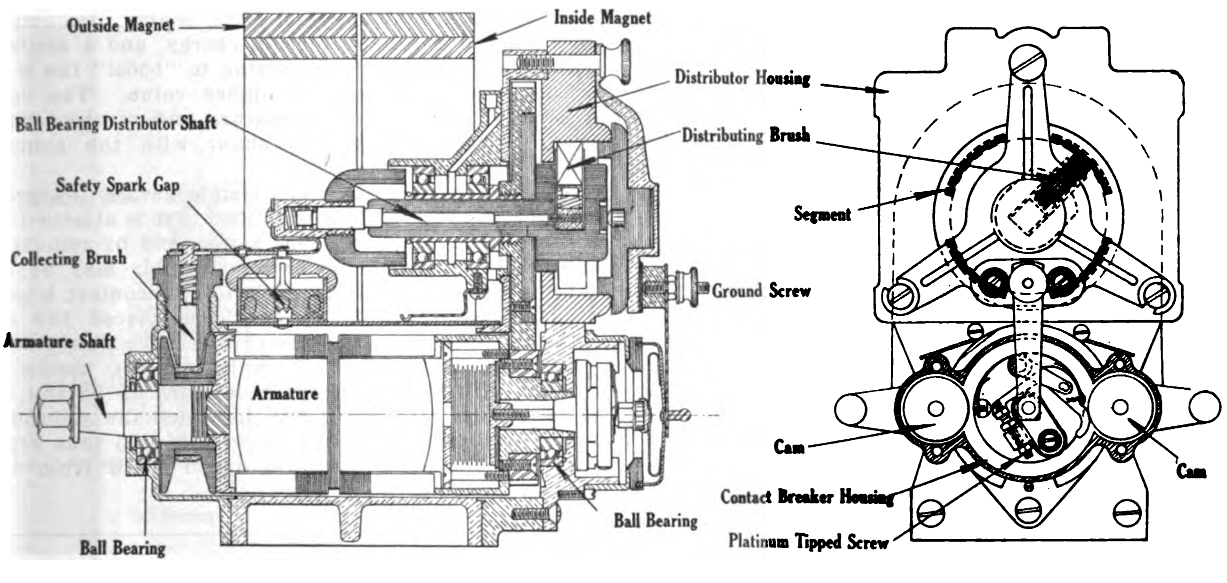

Fig. 33—Principal Parts of Simms S D 4 High-Tension Magneto Generator.

Features of Simms S D 4 Instrument.

The Simms magneto, which is shown in section at Fig. 33 with all principal parts clearly marked, is a direct high-tension device operating on conventional lines, having a double wound armature. The diagram clearly shows the general arrangement, while the sketch explaining the system of wiring at Fig. 34 shows the various connections clearly and the relations of the different important components.

One of the low-tension armature windings is connected to the armature core, and thus to the frame of the magneto, and the other end is led through the hollow spindle of the armature to the contact breaker, the fixed portion of which is insulated, and carries a platinum pointed screw. The bell crank lever carries a second platinum pointed screw and is connected to the frame of the magneto. Both the bell crank lever and the contact piece, together with the contact breaker disc revolve solid with the armature, and as the end of the bell crank lever comes into contact with the rollers of the timing lever, the two platinum screws are caused to break, owing to the bell crank lever rocking on its axis. This sudden interruption of the primary or low-tension circuit induces a current of very high potential in the secondary or high-tension circuit, and gives a flaming spark of great heat at the points of each of the sparking plugs in turn.

The brass cover of the contact breaker is insulated from the frame of the magneto, but is connected by an inside spring with the screw holding the contact breaker in position. The brass cover is held by a flat spring, at the upper end of which will be seen a milled nut, and this screw should be connected to the insulated terminal of an ordinary single pole switch. One terminal of the switch should be connected to the frame of the car. It will thus be seen that for one position of the switch, the nut (which represents one end of the primary armature winding, the other be-

---

*This article, which is descriptive of a number of the best known magnetos to be found in the market, and which are standard with motorists, is reproduced from the "A B C of Magneto Ignition Systems," one of the series of Standard Handbooks of Automobile Mechanics published by The Automobile Journal Publishing Company.

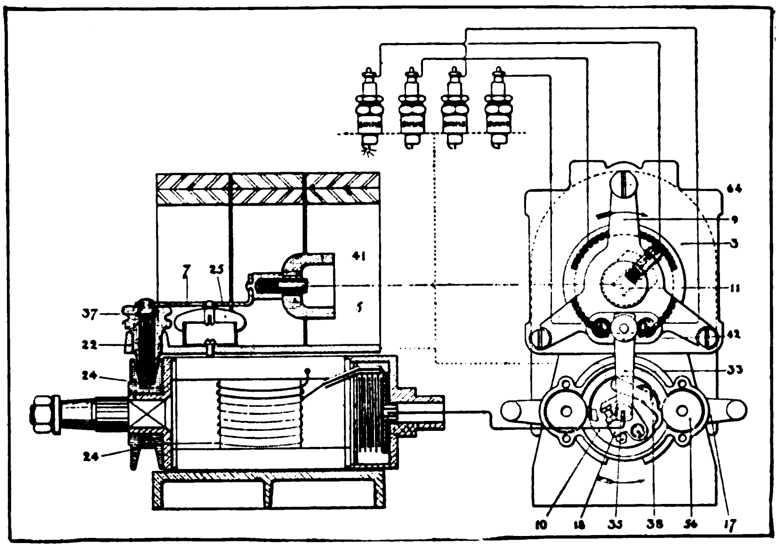

Fig. 34—Arrangement of Simms S D 4 Magneto Wiring.

ing permanently connected to the frame of the magneto) is still insulated, but in the other position is joined to the frame of the car, thus earthing both ends of the primary armature winding, and causing the magneto to become inoperative, and consequently stopping the engine.

The high-tension winding of the armature has one end connected with the primary or low-tension winding, and through this winding to earth, the other end of the high-tension or secondary winding being connected to the collecting ring from which the current is collected by the carbon brush, and thence passes along the conducting bar to the distributor carbon holder, which revolves and distributes the high-tension current to the four segments of the distributor and thus to the four high-tension sparking plugs.

Close to the carbon holder will be observed a porcelain dome forming a cover to the safety gap chamber attached to the aluminum lid. Inside this dome, and connected to the base of the chamber, will be noted four small points. Four similar points will be found inside the porcelain dome. Electrical connection to the sparking points in the porcelain dome is made from the conducting bar. This device serves as a safety spark gap and is utilized to prevent breakdown of the armature winding insulation if a plug wire should become uncoupled, as described elsewhere in this discussion.

Herz Arc Flame Magneto Compact Type.

The Herz-Ruthardt magneto is a simple, compact and efficient device that is somewhat different from the conventional forms, the magnets producing the field for the armature being of distinctive design and high efficiency. The general construction of the device used for four-cylinder motors is shown at Fig. 35, the various parts making up the assembly being marked to facilitate identification.

In this instrument, the magnets are forged of steel, in the form of discs about .5 inch in thickness. These are properly hardened to retain the magnetism and are then ground on the faces till they are absolutely true and are then placed face to face and held together by through bolts. The magnets are of such shape that the usual cast iron pole pieces are eliminated, the armature being ground to fit the space between the magnet poles. The end casings of the magneto are aluminum and carry the annular ball bearings used to support the armature and distributor shafts.

The armature is made of plates of soft Swedish iron, and is a double wound form, coarse wire acting as a generator for low-tension energy, and a secondary coil of fine conductor serving to "boost" the low-tension current to one of higher value. The condenser is built into the armature and revolves with it, its terminals being in shunt with the contact points.

The contact breaker is a simple device, the principal parts being carried on a disc that is attached to the armature shaft with one screw, and by removing the fastening device the entire assembly may be removed easily. The casing enclosing the contact breaker disc has two hardened steel cams placed 180 degrees apart. As the armature revolves, the fibre roller, which is loosely mounted on its spindle, comes in contact with the stationary cam, rides up on the incline, carries the spring arm to which the grounded platinum point is attached up with it, and thus separates the insulated platinum tipped screw from the contact on the spring.

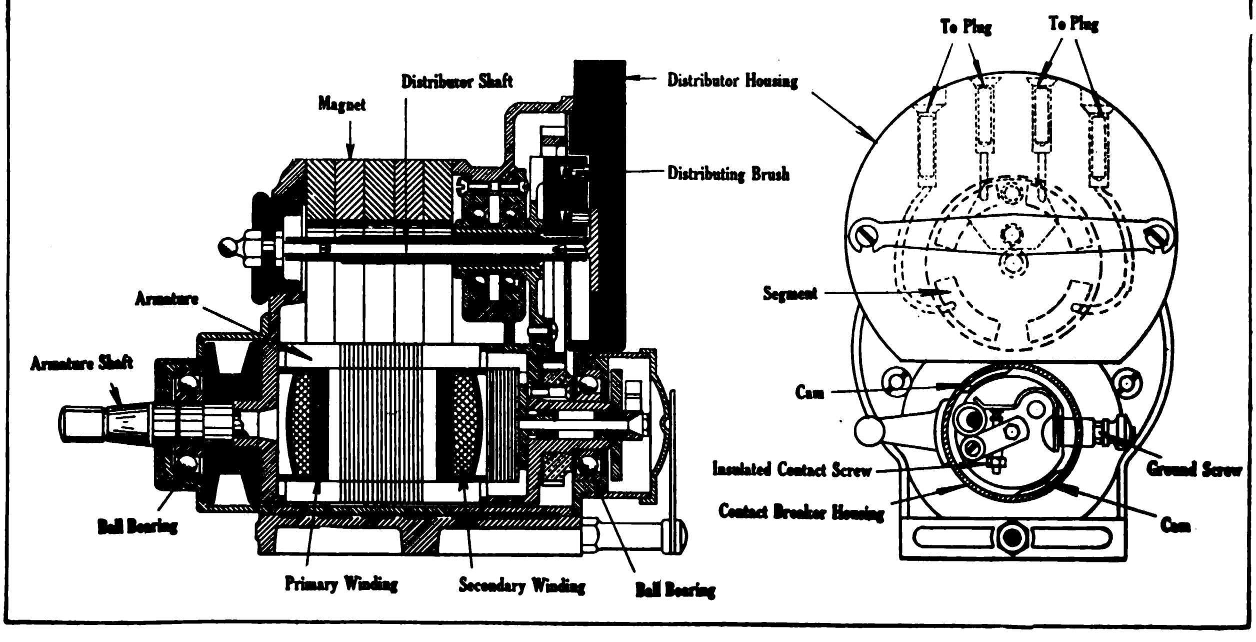

Fig. 35—Longitudinal Section and End Elevation of Herz-Ruthardt High-Tension Magneto.

The distributor member is driven through the usual gearing, and revolves on ball bearings. The current is taken from the collecting ring by a brush mounted at the side of the instrument, a removable wire spring connecting the collecting brush with the button that contacts with the bar running through the insulating bushing in the distributor shaft which delivers the high-tension energy to the revolving distributing brush selecting the segments coupled to the spark plugs in their regular firing order. There are no exposed connections except the spring clip joining the collecting ring and conductor bar that passes through the distributor shaft. The general principle involved is the same as that previously considered in connection with other similar devices.

Type C B U & H Master Magneto.

This magneto is intended for a single system of ignition, and as will be evident from longitudinal section and end elevation presented at Fig. 36, it is the same in essentials as the other instruments of the class. The generator consists of a permanent magnetic field, an armature having two windings mounted on annular ball bearings and designed to rotate between the pole pieces attached to the horseshoe magnets. A circuit breaking device, known as the interrupter is placed at one end of the armature, while the distributor serves to commutate the high-tension energy to the various plugs. In arrangement of windings and method of connection this device does not differ from the others previously described, but the construction of the contact breaker is distinctive, being composed of but few parts, made large and not liable to wear, so no adjustment is provided and it is claimed that the device is immune against any tampering, well meant or otherwise, with the adjustment of the contacts.

The interrupter consists of a bronze barrel having at one end a steel centring disc, which is recessed and which fits over the condenser housing. The grounded contact point is carried by a flexible, yielding bronze spring member that can be moved back by an interrupter arm actuated by cams fixed to the contact breaker housing. The insulated contact is carried by a disc of non-conducting material, the platinum contacts being unusually large. The principal parts of the contact breaker are shown at Fig. 37. The flexible phosphor bronze member is designated by E, the bronze barrel is marked d, the interrupter arm D, and the contact points f.

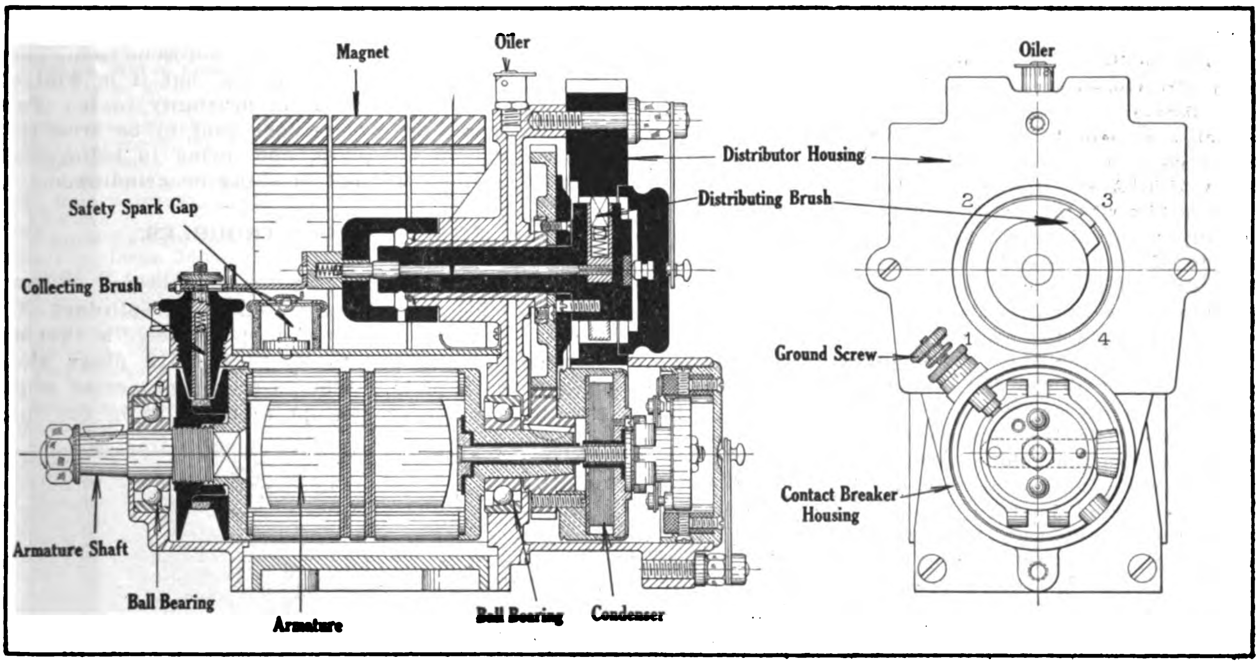

Fig. 36—Drawings Showing Arrangement of Components of U & H Master Magneto.

The various parts of the distributor and contact breaker are also clearly shown in the view of magneto at Fig. 38, in which the various parts have been removed from the assembly to show the principal elements of the two components under discussion.

In the centre of disc C is a conical hole, into which is fitted the taper binding nut G. When in position on the armature, the interrupter is held concentric by the disc e, and held firmly in place by drawing up on the binding nut G, which screws on over the stud H, and which also forms a conductor for the primary current, connecting the insulated end of the primary winding with insulated disc C. The shape of the nut G is such that it is impossible for it to ever work loose. When the short circuiting terminal I is screwed into the magneto its brush comes in contact with the insulated slip ring C-1.

The timing lever A, which fits into the end of the magneto, is arranged to be rotated 30 degrees, and thereby enables the interrupter to be operated with a corresponding range between the advanced and retarded position. The lever A is fitted with two cams J-J, spaced 180 degrees apart. The cams are of vulcanized fibre, and have broad curved surfaces, which engage with the interrupter arm D. In operation practically no wear occurs between the cams and the interrupter arm, owing both to the shape of the rubbing surfaces and the broad surfaces exposed.

How the Interrupter Works.

In the operation, the interrupter arm D comes in contact with the cams J-J, which are so set as to cause the contact points f to separate about one-sixty-fourth of an inch. This movement is made possible by the deflection of the member E, which in turn allows the arm D to rock slightly on its fulcrum F. From the above it will be seen that the bad effects of the inertia of the moving parts have been eliminated, as the flexible member E, which takes the place of the rocker arm in general use in other makes of magnetos, is under compression at all times, and is so designed as to increase its pressure in proper proportion to its deflection. As a result, the arm D follows the contour of the cams, at exceedingly high motor speeds, thereby preventing misfiring under such conditions, due to the time required by the comparatively heavy parts of other forms of interrupters to assume their normal positions after having broken the circuit, in time for the armature to "build up" for the next interruption.

Construction of Distributor Outlined.

The distributor consists of a hard rubber plate S, which is bored out to permit the distributor brush holder t to revolve within it. Arranged equi-distant around the distributor bore are brass segments, one for each cylinder of the motor. These segments connect directly with the terminal sockets in the top of the distributor plate. The segments, the faces of which are carefully machined, together with the terminal sockets and connections thereto, are all moulded integral with the distributor plate.

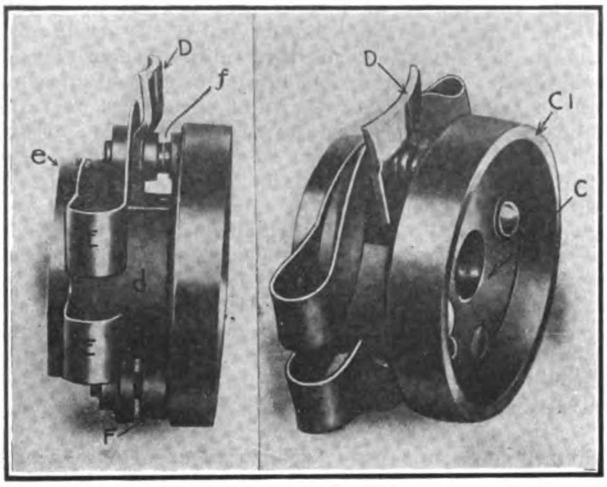

Fig. 37—Contact Breaker Used on U & H Master Magneto.

The distributor brush holder t is arranged to be readily removed from the magneto by pushing the spring clip R aside and taking off the distributor cover P. Removing this cover P exposes the distributor bore, and the brush holder t may then be pulled out of the magneto for examining the distributor brush T or cleaning the bore. The holder t is carried in a sleeve formed by the distributor bearing. Means are provided to prevent replacing the holder in any but the correct position. The sleeve which carries the holder is integral with the bronze distributor gear, which is in turn driven from a steel pinion on the armature shaft. The distributor brush always turns in the opposite direction from that of the armature.

The U & H Double Armature Magneto.

It has long been known by the engineering fraternity that the temperature of the ignition spark is not the only factor in determining engine efficiency and the power of the explosion, but that this is also largely influenced by the position and number of sparks utilized, especially in large engines. As is well known, the explosion or burning of a gas mixture occupies an appreciable amount of time, this period depending upon the rate of flame propagation of the gases burned, which in turn, depend upon their chemical composition and the degree of compression prior to ignition. To allow for this, arrangements are usually made for advancing the time of spark, hence it is agreed that if two simultaneous sparks are produced in the combustion chamber at different points, especially if the engine is a large one, much less time will elapse between ignition and complete combustion than with a single spark to kindle the compressed mixture.

Several of the manufacturers of magnetos have produced double armature forms in which two shuttles are mounted tandem on a common spindle and turn in a common magnetic field. Two distributors are employed, and two sets of contact breaking elements are provided, so that the complete instrument is virtually two magnetos in one. As the armatures and other components are driven simultaneously from the same primary source the sparks are synchronized occurring at exactly the same time. Such an instrument is valuable in races and tours because it furnishes more current and the engine is more powerful than with single ignition, and at the same time, should one part of the magneto become inoperative for any reason, the other half, which is a complete generator in itself will continue to supply current for ignition.

(To Be Continued.)

CASE HARDENING WITH KEROSENE.

Steel may be hardened by using kerosene, says a well known authority on metals. The article is rubbed thoroughly with ordinary washing soap and then placed in a charcoal fire and heated to a cherry red, after which it is plunged into the kerosene bath. There is no danger of the oil igniting, but it is well not to have any naked flame in proximity to it. Parts hardened by this process are said to be free from cracks and do not warp, and owing to being white can be finished without cleaning or grinding.

SPARK PLUG TROUBLES.

"One very good reason for the absence of spark plug trouble today," says Charles F. Splitdorf, New York City, maker of ignition specialties, "is that motorists have learned to let their spark plugs alone. The moral is plain. When a plug is suspected of giving trouble, never attempt to mend it on the road. Replace it with a fresh one and do the repairing some other time and under more favorable circumstances. The rule holds good even if the difficulty appears to be nothing more than a loss of compression, due to leaky packing."

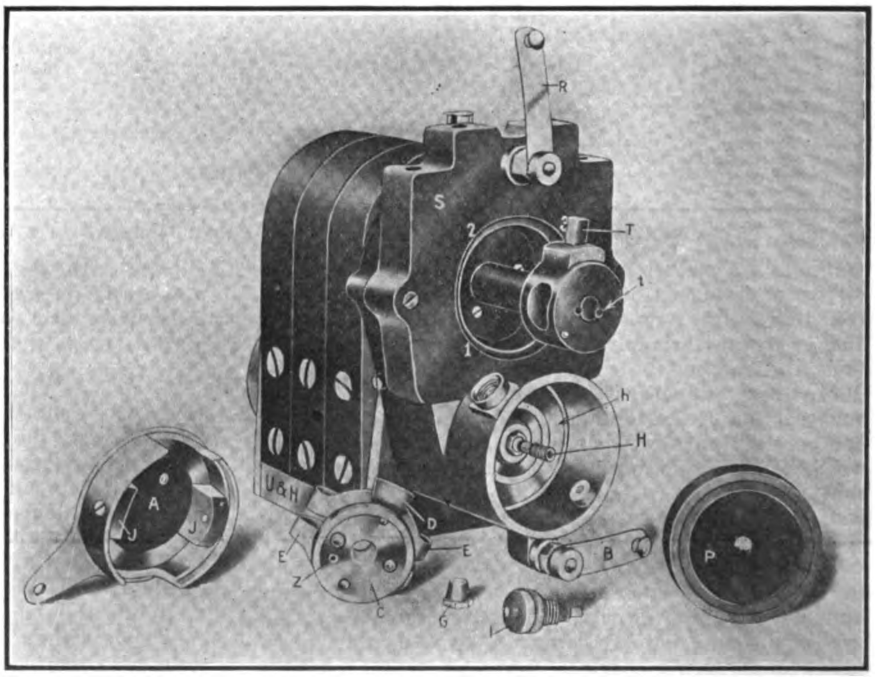

Fig. 38—U & H Master Magneto Partially Dismantled to Show Principal Parts of Contact Breaker and Distributor.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS

The following companies have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

Felipse Tire and Rubber Company, New York City; $50,000; incorporators, Simon Schwartz, S. H. Silverman, H. A. Bloomberg.

Louisville Lozier Company, Louisville, Ky.; to deal in supplies; $20,000; incorporators, Howard Lothrop, H. T. Martin, Robert Stewart, D. T. Marantelle and Mary S. Lothrop.

Kadix Newark Motor Truck Company, East Orange, N. J.: $200,000; to manufacture motor trucks; incorporators, D. Lester Dann, G. F. Kallberg, Russell M. Colburn.

Hoopeston Automobile Company, Hoopeston, Ill.; automobiles and accessories; $25,000; incorporators, F. W. Wallace, J. H. Norris and W. N. Ferguson.

Byam International Autotire Company, Chicago, Ill.; to manufacture tires; incorporators, W. W. Byam, E. C. Byam, W. A. Scott.

Vixen Motor Company, Indianapolis, Ind.; $12,000; incorporators, F. C. Schmid, W. J. Harris, C. O. Van Horn, S. B. Lindley, D. K. Lindley.

Hercules Truck Company, Alexandria, Va.; $100,000; incorporators, S. W. Woodward, O. Ducker, E. S. Parker, B. W. Parker.

Oldsmobile Company of Buffalo, Buffalo, N. Y.; $10,000; incorporators, E. E. Holmes, T. S. Buckingham, J. C. Cannon.

United Garage Company, Boston, Mass.; $15,000; incorporators, Jesse Goode, J. R. Jones, W. F. Waters.

Todd & Courtney Company, Barberton, O.; $10,000; to deal in automobiles and accessories; incorporators, John H. Todd, Cora A. Todd, I. O. Courtney, Laura M. Courtney, C. C. Courtney.

Roby Carburetor Company, Indianapolis, Ind.; $10,000; to manufacture parts; incorporators, F. S. Roby, C. J. Schuh, E. D. Salisbury.

Elton Garage, Inc., Waterbury, Conn.; $25,000; incorporators, A. C. Judd, E. W. Judd, J. R. Hughes.

C. & R. Auto Company, Los Angeles, Cal.; $25,000; incorporators, Jay C. Cook, A. B. Cram, B. F. Robinson, George H. Cram, F. D. McClure.

Monticello Automobile Company, Norfolk, Va.; $15,000; incorporators, E. L. King, G. F. Bailey, E. J. Hickford.

Dual Wheel Company, New York City; wheels and truck parts; $300,000; incorporators, F. B. Cochran, Alexander Dow, C. W. Jewell.

C. E. Hall & Sons, Inc., Malden, Mass.; $5000; incorporators, A. N. Hunt, R. J. Cram, F. M. Sawtelle.

Lewis Garage Company, Boothbay Harbor, Me.; $10,000; incorporators, J. Edward Knight, E. T. Lewis, C. R. Lewis.

Unique Vulcanizing Company, Jersey City, N. J.; $50,000; incorporators, J. H. Hutten, J. P. Becker, U. C. Huber, E. R. Hussey.

Buick Sales Company, Utica, N. Y.; $5000; incorporators, George Beatty, A. D. Beatty, Emma L. Beatty, Patrick R. Ervin, H. S. Wilson.

Sceptre Motor Company, Brooklyn, N. Y.; $5000; incorporators, G. B. Ellis, William Y. Chandler, G. A. Wingate.

Isotta Fraschini Motors Company, New York City; to manufacture and deal in motors; $25,000; incorporators, G. M. Heckscher, G. N. Thurber, C. B. Jacque.

Federal Trucking Company, New York City; to manufacture and deal in motors; $25,000; incorporators, Donald B. Abbott, J. D. Fackenthal, J. I. Kauffman.

Blaisdell Automobile Company, Dexter, Me.; $25,000; incorporators, Charles R. Blaislell, F. D. Blaisdell, W. H. Judkin.

U-Nit Motor Company, Wilmington, Del.; to manufacture automobiles and motors; incorporators, Edwin C. Reed and others.

Salem Oil & Grease Company, Salem, Mass.; to manufacture oil for automobile use; $25,000; incorporators, Arthur H. Rowbotham, H. T. N. Smith, W. H. Rowbotham.

American Pneumatic Starter Company, Alexandria, Va.; $150,000; to manufacture starters; incorporators, C. A. Douglass, G. L. Parker, A. E. Leckie.

California Automobile Timetest Company, Los Angeles, Cal.; $100,000; incorporators, I. P. Carr, R. L. Bisby, E. B. Coll, Joseph H. Gosling and E. Kershner.

Great Eagle Motor Devices Company, Lindsborg, Kan.; $130,000; to manufacture and sell motor devices.

Standard Resilient Wheel Company, Inc., New York City; $500,000; incorporators, J. Gaynor, P. B. Verplanck, S. Jochelson.

D. G. Hutchcroft & Sons Company, Cleveland, O.; $10,000; incorporators, D. G. Hutchcroft, Glidden W. Hutchcroft, Thornton Hutchcroft, William Merts, S. H. Meacham.

Norman County Auto Company, Ada, Minn.; $50,000; president, Peter Matson; vice president, D. C. Lightborn; secretary, Louis Hintze; treasurer, C. J. Lofgren.

Dennis Motor Company, Toledo, O.; $25,000; incorporators, H. H. Dennis, C. W. Close, Allen E. Reid, R. S. Woodrow, John G. Meister.

Sutherland Automobile Air Appliance Company, Louisville, Ky.; $10,000; incorporators, M. M. Glavin, John W. Barns, T. R. Cartmell.

Omaha Motor Car Company, Augusta, Me.; $1,000,000; to manufacture and sell motor cars; incorporators, R. S. Buzzell, L. J. Coleman.

Chauffeurs Legal Association, Boston, Mass; $10,000; incorporators, Jay R. Benton, George A. Kearsley, Francis D. Harrigan.

Williams Auto Company, Boston, Mass.; $2500; directors, James F. Hanley, William T. Hanley, Fred W. Ryan.

Auto Tractor Company, Augusta, Me.; $100,000; incorporators, L. J. Coleman, R. S. Buzzell.

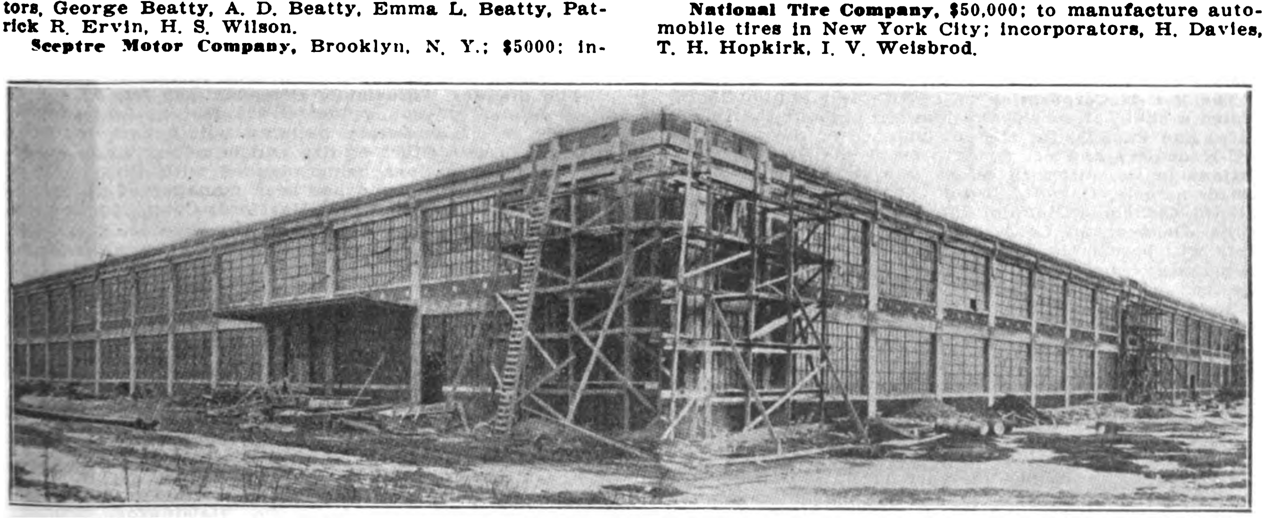
Worcester Automobile Parts Company, Worcester, Mass.; $10,000; incorporators, James N. Heald, Cyrus A. Cowan, John A. Doane.

Porto Rico Motor Company, Greenwich, Mass.; $150,000; officers, Loren J. Whiteside, Milton A. Mills.

Lyons Auto Company, Grand Forks, N. D.; $15,000; incorporators, J. W. Lyons, M. J. Lyons, M. M. Lyons.

Twin City Auto Company, Council Bluffs, Ia.; $25,000; incorporators, S. V. Barnhart, J. J. Klein, H. W. Neiman, M. C. Goodwin.

National Tire Company, $50,000; to manufacture automobile tires in New York City; incorporators, H. Davies, T. H. Hopkirk, I. V. Weisbrod.



Outer Shell of Continental Manufacturing Company's Plant in Detroit, Said to Be the Largest Institution of Its Kind in the World.

WITH THE MANUFACTURER

The Perfection Spring Company, Cleveland, O., has placed E. F. Lake in charge of its laboratory.

The Teel Manufacturing Company, Medford, Mass., which has been making the Teel truck and had announced a new one-ton machine to complete its line, has abandoned the latter project and is to handle the Federal truck instead.

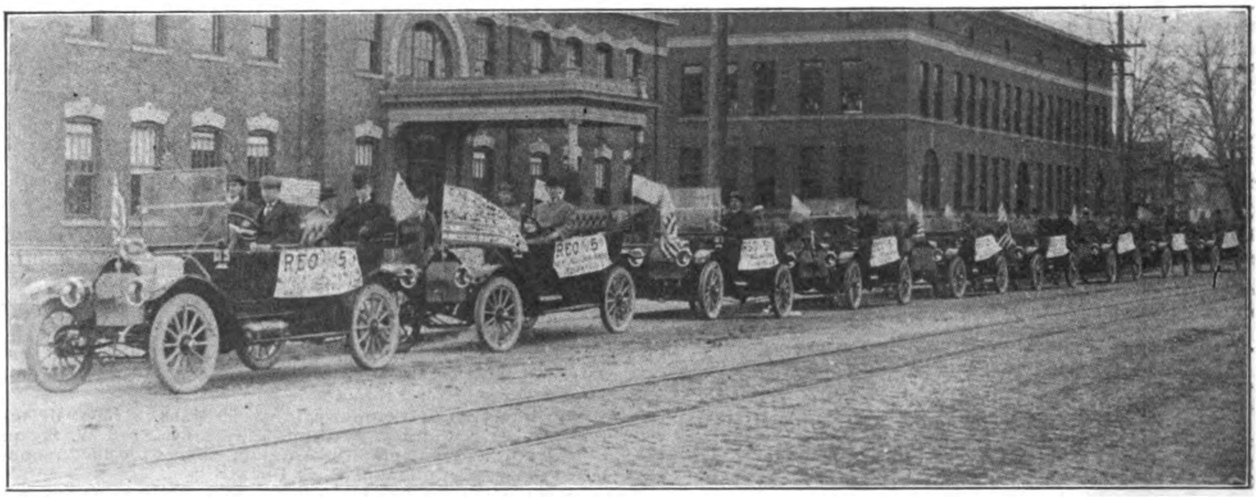
The Mather Spring Company of Toledo, O., has appointed G. H. Brown sales manager with headquarters in Detroit. Mr. Brown was formerly with the Standard Sales Company.

The Yates-Upholt Brass Company, Saginaw, Mich., has resumed operations after being idle for some two months. The output is to be taken by the Jackson-Church-Wilcox Company and the Marquette Company in Saginaw, both of which are subsidiaries of the General Motors Company.

The Ignition Starter Company, Detroit, has opened in that city a special service department for users of the Disco starter. George Waller has been placed in charge of the new department, which is located in the Dodge building. V. J. Jacobs, formerly with the Studebaker Corporation, has been added to the Disco sales force.

The Enterprise Auto Machine Works, Pontiac, Mich., has just taken possession of a new factory with modern equipment.

The Billings & Spencer Company, Hartford, Conn., has discontinued by mutual consent the selling arrangements with the Claire L. Barnes Company of Chicago, and will market its line of tools and forgings direct. The Billings & Spencer Company has more than doubled its capacity in the last two years and now has its new plant at Dividend, Conn., in full operation.



F. N. Milliman of Kalamazoo, Mich., Overcoming the Difficulties Attendant upon the Shortage of Freight Cars by Delivering Reo the Fifths over the Road.

The Harder Auto Truck Company of Chicago has secured F. J. Posta as sales manager. He was formerly with the Kissel Motor Car Company in Chicago.

The Empire Tire Company, Trenton, N. J., maker of Empire tires, is distributing a neat little cardboard score keeper to baseball fans, enabling the runs, hits and errors to be counted.

The R-C-H Corporation of Detroit is planning to establish a chain of service stations throughout the United States and Canada, for the convenience of the numerous R-C-H dealers and users. At present the plans call for stations in the cities in which a branch is now maintained; namely, Detroit, Boston, New York, Philadelphia, Atlanta, Cleveland, Buffalo, Chicago, Kansas City, Minneapolis, Denver and Los Angeles. A complete stock of parts will be carried in each station, so that it will not be necessary to send to the factory for replacements. The first of the stations is already in operation in Detroit, and is illustrated herewith. It is elaborately equipped, 124 by 60 feet, of brick and concrete construction. Other stations are to be put into operation as soon as possible.

R. M. Owen & Co. of New York recently sent four Reo the Fifths by express from the factory in Lansing, Mich., to M. A. Young, the Detroit dealer, who had secured four orders on the condition that delivery be made within 24 hours.

Charles A. Trask has resigned as chief of the engineering department of the Cartercar Company, Pontiac, Mich., and is to make a three months' trip abroad. He will study automobile engineering practise and aeronautical work in the important European centres and will conduct investigations for several motor car concerns.

LeHardy & Lindsay, Rochester, N. Y., agent for the Marmon, made by the Nordyke & Marmon Company, Indianapolis, have contracted for the property at 308-10 East avenue. The building will be altered and a show room and garage built.

R. B. Raynor, Fort Wayne, Ind., has secured the agency for the Cutting car, made by the Clarke-Carter Automobile Company, Jackson, Mich., and will operate under the firm name of the Cutting Sales Company, conducting a garage as well as salesrooms.

George Yoa, Syracuse, N. Y., agent for the Abbott-Detroit, made by the Abbott Motor Company, Detroit, recently moved into a new garage at 1057 South Clinton street. The building is 40 by 110 feet, two stories high.

The Trenton Motor Car Company, Trenton, N. J., composed of Hugo Ufert and Oliver O. Moore, recently purchased Dorsett's Electric garage, at 111-113 Chancery street. Extensive alterations have been made, and the new concern carries a full line of parts and accessories.

The New England Auto & Supply Exchange, Bridgeport, Conn., has been organized by George W. Jackman, and a salesroom opened at 608 Main street, where a full line of supplies is carried.

The Pullman Motor Car Company, York, Penn., has opened salesrooms in Pittsburg, on South Highland avenue. The Auditorium building is to be remodeled at a cost of about $40,000 and will be used by the branch, which will be incorporated as the Pullman Auto Company of Pittsburg.

The Neustadt Automobile & Supply Company, St. Louis, Mo., has secured as department managers, Earl J. Hoffman, formerly with the Timken Roller Bearing Company, and Robert W. Maloney, an expert on automobile lighting.

The Dwyer & Roche Company, Hartford, Conn., has taken the livery stable at 18 John street and is conducting an automobile painting and repair business. The building is centrally located, and contains 15,000 square feet of floor space.

C. E. Havens has been appointed manager of the service and technical departments of the Abbott Motor Company, Detroit, having left the Hudson Motor Car Company. Mr. Havens has had considerable experience in the factories, having been connected with the Thomas and Oldsmobile plants.

The Repass Automobile Company, Waterloo, Ia., a branch of the Herring Motor Car Company, Des Moines, has moved to new quarters, 217-19 West Fifth street, where they have ample room to display Ford cars, and to conduct a repair and service department. A total of 50,000 square feet of floor space is occupied by the company.

The Highland Garage, Birmingham, Ala., has leased the building formerly occupied by Drennen & Co., and will convert it into a show room. This concern also purchased a garage located at Five Points recently.

A. E. Hunter, well known to the automobile men in northern California, has taken the agency of the Firestone-Columbus, made by the Columbus Buggy Company, Columbus, O., for San Francisco, Cal., and will carry a full line including the electric automobile.

The Howard Company, New Haven, Conn., is to erect a new garage, 50 by 75 feet, at Plymouth street and the boulevard. It will be one story, of brick, and will replace the garage recently destroyed by fire.

The Hearn Tire & Rubber Company, Cincinnati, O., has taken the agency for Kelly-Springfield tires, handling the product of the Consolidated Rubber Tire Company of Akron, in central Ohio.

N. V. & H. N. Porter, New London, Conn., is the latest firm to open a garage in that town. The firm handles the Maxwell car at 426 Bank street.

W. S. Hathaway has taken the agency for the Reo car, made by the Reo Motor Car Company, Detroit. His territory is Kansas City and the Southwest, in which he succeeds the C. L. Taylor Motor Company. The new agency will be known as the Southwest Motor Company, and will be located at 1616-18 Grand avenue, Kansas City.

The H. Eisner Company, Boston, the New England service department of the Eisemann Magneto Company of New York City, is issuing a neat postal folder calling attention to the fact that prompt service will be given in making repairs, etc.

The Remy Electric Company, Anderson, Ind., announces the appointment of the Lamb Electric Company, Grand Rapids, Mich., as representative of Remy ignition specialties.

The Lozier Motor Company, Detroit, has appointed W. L. Davis as eastern factory representative.

The Velie Motor Vehicle Company, Moline, Ill., announces the appointment of Fred E. Bradfield as manager of the Boston branch. He was formerly connected with the Chicago branch.

John A. Murphy, cashier of the Henderson Motor Sales Company, Indianapolis, Ind., has been placed in charge of the order department of that company.

TRADE INFORMATION EXCHANGE
BUSINESS PROPOSITIONS.

Two Classes of Opportunities Are Offered Below—for Agents to Secure New Lines, and for Manufacturers to Secure Agents. These Propositions Offer State and Community Representation to Makers of Pleasure Cars, Motor Trucks; Accessories and Supplies, While Dealers May Get in Touch with Manufacturers Desiring to Extend Their Agency Connections. All Are Opportunities for Live Men and Firms Seeking Profitable Relations.

The Following Details of Trade Opportunities Presented by Members of the Trade Information Exchange Are Published Without the Names of the Firms, Which Desire Negotiations to Be Strictly Confidential. Replies Should Be Addressed by the Number Given and Sent to the Exchange with Postage for Forwarding to the Concerns.

AGENTS WANTED.

761, Pleasure Cars—Territorial agencies open for the sale of a car with a standard chassis, equipped with either touring or runabout bodies, marketed with complete high grade equipment. Price for runabout, $1800 f. o. b. at the factory. The cars are guaranteed by the maker as high grade in every detail.

822, Pleasure Cars—Some especially desirable territory is open for a line of cars built with two types of chassis, 35 and 40 horsepower, two styles each of four and five-passenger bodies, and roadster. The cars are sold with excellent equipment throughout, at prices ranging from $1400 to $1700 f. o. b. at the factory. This line is produced by an old and thoroughly reliable firm and is well known.

804, Pleasure Cars—A large manufacturer of a popular priced car has an interesting proposition for those desiring the agency for such a machine. Two types of chassis are produced, one rated at 26 horsepower by S. A. E. formula and fitted with two types of runabout and five-passenger bodies, and the other fitted with five-passenger body only. Prices range from $1150 to $1500, fully equipped and f. o. b. at the factory.

772, Trucks—A desirable connection may be made by a number of agents for a line that includes both electric and gasoline delivery wagons and trucks. The machines are built by a concern of undoubted reliability, with large resources, and the guarantee given to purchasers is very broad. The factory attention given by this company is such as to justify careful inquiry. The range of prices is extremely wide, vehicles being produced for every requirement.

798, One-Ton Truck—Agencies can be established for a high grade service wagon of one ton capacity, made with but one chassis. The design is in every way mechanically consistent and the construction and material are unusually substantial. The machine is furnished with self-starting equipment, and the opportunity is one of distinct merit.

806, Delivery Wagon—The maker of a standard delivery wagon with a capacity of 1500 pounds, selling for $875 f. o. b. factory, wishes to establish agents throughout the country. The machines are well constructed, of high grade material, have all desirable equipment, with open body standard, and are sold with a broad guarantee. The line is one which will interest all desiring to secure the agency for a popular priced and reliable machine.

779, Delivery Wagon—Agents generally are required by a well established firm making a delivery wagon with a capacity of 3000 pounds. The vehicle is high grade in every respect, and possesses an unusual number of exclusive features which insure economy of time and attention and make for reliability. The price for the chassis ranges from $2200 to $2500 f. o. b. at the factory.

918, Delivery Wagons—Manufacturer of two types of delivery wagon, one of 1000 pounds and the other of 1500 pounds capacity, the first with enclosed and the latter with open body, will make attractive arrangements with live wire representatives. Some excellent New England territory is available. The machines sell for $1000 and $1050 f. o. b. at the factory.

814, Oil and Grease—The manufacturer of a well known and widely advertised line of automobile oils and greases has an agency contract proposition that is exceedingly liberal to offer to those who wish to connect themselves with a reliable and dependable firm. The oils and greases are of grades to meet every requirement and are produced from the highest class crudes by scientific refining.

816, Spark Plugs—A spark plug manufacturer, producing plugs that have exclusive and desirable qualities, wishes to establish a number of first class agencies. A liberal contract is offered and territorial rights will be given to those who can demonstrate their ability to secure business.

801, Plant Opportunity—A company manufacturing high grade pleasure car and motor truck wagon wheels in New York State, having excess factory space and facilities, will consider proposition to combine with a concern manufacturing automobile parts or completed vehicles. The plant is new, equipped with the latest machinery and ample power, has abundant water from artesian wells and good fire protection. The site covers four acres, with an 856-foot frontage on the railroad. The city is a rapidly growing one and possesses the best of freight and express shipping facilities. The company desires to increase its capital and business, and to the proper parties will lay the proposition open to the closest inspection.

801, Pleasure Cars and Trucks—Agencies are open for a line of high grade pleasure cars, trucks, municipal service wagons and fire department apparatus, widely known and well advertised, made by one of the best established manufacturers in the industry. Every class of vehicle required for business or pleasure is produced and the maker is prepared to afford factory service of a character calculated to secure results. The proposition is open only to those who can purchase a demonstrating machine and contract for a number of cars commensurate with the territory taken.

892, Delivery Wagon—An excellent opportunity is offered dealers who desire to handle a small delivery wagon possessing unusual merit. The car has a maximum capacity of 1600 pounds and sells for $750. Manufactured in Newark, N. J., it possesses unusual strength and reliability, coupled with the simplicity which was the keynote in designing the car. An excellent proposition will be made to dealers throughout the country.

893, Gasoline Gauge—The manufacturer of a new gasoline gauge wishes to secure dealer agents in all parts of the country. To established firms an attractive proposition will be submitted. The device is simple, reliable, and thoroughly protected by patents. It is sold at a price which makes it desirable for both dealer and user.

847, Electrical Goods—A large manufacturer of electrical goods, such as air compressors, pumps, polishing motors, and other appliances for garage and automobile use, desires agents in all parts of the country. To firms capable of handling a line of high class goods, an excellent proposition will be made. The concern is a well known one in the electrical field, and possesses a large organization, to which it desires to add a number of automobile firms.

LINES WANTED.

810, Accessories—A manufacturer of various specialties, located on the Pacific Coast, desires to secure the agency for automobile accessories of all kinds. Horns, lamps, tools, starters, etc., are desired, and a small line of supplies will also be carried. Manufacturers of well known and standard accessories and supplies are requested to submit their agency propositions, with catalogues and full information.

811, Accessories and Garage Equipment—A large machine shop in Vermont, making automobile and garage specialties, desires to secure agency relations with manufacturers of standard accessories, supplies, garage equipment and similar lines. The concern is an old established one, and contemplates entering the automobile business extensively.

929, Pleasure Cars and Trucks—The agency for two well known lines of cars in Omaha, Neb., wishes to expand and secure the representation of pleasure cars selling from $750 to $1250, and trucks from $800. The concern has been successful in handling two of the most prominent of the moderately priced lines of cars, and knows its field well. Consideration will be given only to nationally known cars which offer possibilities commensurate with the field.

833, Pleasure Cars and Accessories—The agency for a line of pleasure cars selling for not more than $2000 is desired by the proprietor of a Vermont garage. The locality offers an excellent opportunity and the man is well known and progressive. He also wishes to handle standard lines of accessories and supplies. The garage is to be improved, and catalogues are desired from manufacturers of garage and repair shop equipment and supplies.

760, Fire Apparatus—A man located in Boston desires to hear from manufacturers of fire apparatus of all kinds, including hose and chemical combinations, ladder trucks, motor propelled steam pumping engines, gasoline pumping engines, and speedy fire chief's cars. The market is an excellent one, and no time should be lost by manufacturer desiring to secure representation by this man.

968, Accessories—A new concern, located in Rock Island, Ill., and carrying a line of accessories, desires to increase its business by the addition of new lines. Well advertised articles of merit are wanted, and the company desires to build up a high class trade. Supplies are also desired, such as tires and oils. The company is a new one, but gives every evidence of success, and connection with it will no doubt prove of mutual profit.

946, Accessories, Supplies, Tools—The manufacturer of a line of pleasure and commercial cars, located in Wisconsin, desires to hear from manufacturers of automobile equipment, accessories, supplies and tools of all kinds. The company has been developing its agency for some time, and now plans to expand. Factory equipment and machine tools are also to be purchased.

889, Second Hand 'Buses—The owner of a rapidly growing and beautiful suburb of Jacksonville, Fla., desires to hear from firms having second hand 'buses for sale. The machines must be in good condition and capable of performing hard work, though neither bad roads nor long distances are to be covered.

911, Accessories and Supplies—A manufacturer and dealer in Illinois wishes to add to his lines of accessories, supplies, and miscellaneous equipment. Catalogues are wanted from manufacturers of such goods, with agency propositions. Well known and standard lines are desired, but a new article of merit will be handled, or manufactured if desired.

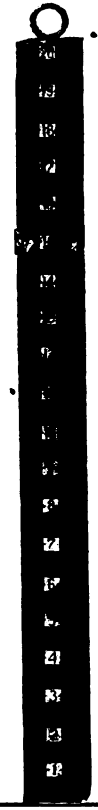
762, Pleasure Cars, Trucks and Supplies—Boston men desire to hear from manufacturers of pleasure cars, trucks and supplies, catalogues and full details of the agency propositions being wanted. It is contemplated to enter the business extensively, with several lines of cars and the more prominent accessories and supplies.

803, Accessories—A concern in New Bedford, Mass., desires to handle a general line of accessories. The more popular devices are desired, particularly those whose practicability and value has made them standard and in demand. The co-operation of the manufacturer with the dealer as well as the quality of the product and its advertising, will be considered.

764, Cars and Accessories—A subscriber to the Exchange, located in Boston, desires to enter the automobile business extensively, and wishes to hear from manufacturers of pleasure and commercial cars and camp wagons, accessories and supplies. Well advertised lines of quality are desired.

826, List of Motorcycle Accessories—A list of manufacturers of motorcycle accessories and parts is desired by a man located in Newtonville, Mass. The list must be reliable and complete, and include as many details of the firms as possible.

912, Dumping Bodies—A coal firm handling a large tonnage desires to hear from firms making motor truck bodies suitable for the coal trade. Those which deliver the coal at a height are desired. An apparatus of elevator buckets scooping the material from the body and delivering it where wanted is preferred.



Patented March 5, 1912.

GASOLENE GALLON GAUGE

For Automobiles and Motor Boats.

For measuring the amount of gasolene in supply tanks.

The numbered markers are slideable and may be adjusted to show the number of gallons in any given tank whether it is square, round, oval or irregular in shape.

The depth of each gallon is the same in square sided tanks.

In round or oval tanks the depth of the gallons will be less towards the middle of the tank.

The outside level marker shown is to register the amount in the tank at any given time.

Handsomely finished in black stained wood, 15 inches long, with 20 brass markers.

If your tank holds more than 20 gallons, extra markers will be inserted as ordered.

Price 50 cents postpaid anywhere in the United States.

Send Express or Postoffice money order. Stamps accepted.

SPECIAL.

Extra long gauges made to order for very deep tanks; not more than 24 inches in length, with markers numbered from 1 to 30 as may be required.

Price 75 cents, postpaid anywhere in the United States.

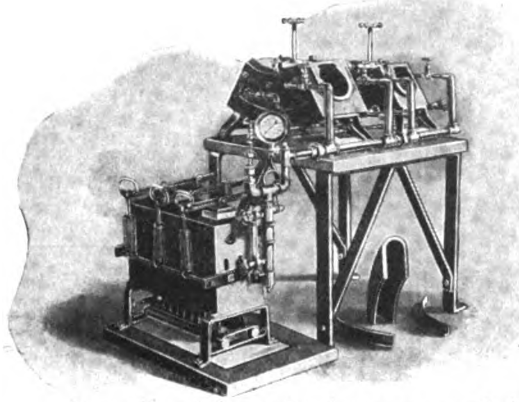
Large Profits in Tire Repairing



EITHER as part of a garage and general auto repair business or as a separate venture. Requires very little capital to equip a shop completely with the best tire repairing outfit in the world. The equipment can be paid for and a good profit made by the first season's work. Every motorist must have tires repaired—every motorist in your vicinity is a possible customer for tire repairing. Get the right kind of equipment—one that produces work that you can guarantee—the Akron-Williams Tire Repair Equipment which was designed by practical tire factory repairmen.

Localized heat is the secret of the Akron-Williams. Three separate steam chambers in each of our sections, our exclusive patented feature, limit the curing process to the repaired part. Proof that the Akron-Williams is the best is the fact that the big tire manufacturers use it—Firestone, Goodyear, Diamond, Republic, Pennsylvania, Revere, Hartford, Consolidated, Empire, Manhattan, Shawmut and many other tire manufacturers are among our customers. They know by experience what is most practical. We can equip a tire repairing plant of any desired capacity. Don't delay getting into this profitable business. Get into correspondence with us to-day. Write for Bulletin 12 anyway.

THREE MILLION DOLLARS FOR EVERITT.

Flanders Group Represented in Reorganization of Metzger Concern---Weed Chain Secures Another Important Victory--Klaxon-Miller Suit Withdrawn---Latest Appointments and Promotions.

The various rumors concerning the reorganization of the Metzger Motor Car Company, Detroit, maker of Everitt cars, appear to have been set at rest by the incorporation of the Everitt Motor Car Company, under the laws of Delaware, for $3,000,000, by Byron F. Everitt, Paul Smith and Harry W. Davis. The new concern has taken over the manufacture of the Everitt. It may be mentioned, in passing, that the old company was capitalized for $1,000,000.

As yet no definite plans have been announced. A large number of men formerly connected with the Studebaker Corporation have joined those associated with the Metzger Motor Car Company. B. F. Everitt is president and Paul Smith vice president. The latter formerly was sales manager of the E-M-F and Flanders business of the Studebakers. W. E. Flanders, whose name has been associated with the new concern, is said not to be directly connected with the enterprise. Vice President Smith, who also is sales manager of the Everitt Motor Car Company, makes the following statement:

"No new models are contemplated nor any changes, even the slightest, will be made, either in the mechanical features, prices or in any other way. The advent of the Flanders group in the Everitt company simply means that the capital has been increased from $1,000,000 to $3,000,000, and this means three times the factory capacity and three times the output. In short, it will relieve any condition which has confronted our dealers everywhere and will enable them to meet more nearly the demand for Everitt cars than they have been able to do in the past."

STUDEBAKER SEES NEW ERA.

According to Clement Studebaker, Jr., first vice president of the Studebaker Corporation, maker of the E-M-F and Flanders cars and Studebaker electrics, the automobile industry has entered upon a new era. He holds that business practises which have been in vogue must be replaced by more substantial efforts with respect to the future. What this future will be, he is unable to venture a guess, but he suggests that some idea may be gleaned from the fact that if the cars produced by his concern this year were placed end to end, they would extend from New York to Boston, a distance of 214 miles.

"The automobile business cannot be run in the future as it has been in the past," says Mr. Studebaker. "The automobile is no longer an experiment, a novelty or a toy. It is an immensely important mechanical feature of our natural life. The wild cat times are over. Mushroom growths are at an end. The rush into automobile manufacture, the craze for flash and novelty, the systems of making and selling, the reckless disregard of after service in a car, will not be tolerated, and careful manufacturers must think of the future."

WEED CHAIN DECISION.

Judge Coxe, in the United States court of appeals for the second district, sitting in New York City, handed down a decision June 7, in an action brought by the Weed Chain Tire Grip Company, and others, against the Atlas Chain Company. The case was brought before this court on an appeal by the defendant. It hinges upon the interpretation of the so-called Parsons patent, granted to Harry Parsons, March 24, 1903, for an improved "anti-slipping and anti-puncturing device for the tires of vehicles and like purposes," and employed in Weed chains. The opinion of Judge Coxe is of special interest and is in part as follows:

> The device which is the subject of the patent consists of a network of rings, or strips of metal, or a series of small chains, or bands, fitted loosely over the periphery of the wheel or passing from side to side across the tire and prevented from coming off by two rings, hoops, or their equivalent, such rings, or one of them, being provided with means of attachment and detachment. The said rings are smaller in diameter than the periphery of the wheel and cannot come off accidentally. The rough surface provided by the network, chains or the like, will prevent the slipping of the tire on the road and the consequent skidding of the tire.
>
> It is probable that the genius of the inventor will yet devise a more simple and efficient method of preventing the skidding of rubber tired vehicles, but so far as the art has developed, Parsons appears to have been the first to provide means which minimize the greatest

danger which confronts the traveller in such vehicles.

The first claim of the patent, which is typical of the other five, is as follows: "Anti-slipping or protecting means for the peripheries of wheels, pulleys or the like, comprising attaching elements at opposite sides of the wheel, and an anti-slipping or protective medium secured to the attaching elements and extending across and around the periphery of the wheel, said parts being disconnected, though retained on the wheel whereby the anti-slipping or protective medium is free to move or shift its position around the periphery thereof."

It is said that the words, "fitting loosely over the periphery of the wheel," in the description and the words, "free to move or shift its position around the periphery thereof," in the claims, require a construction that the cross chains shall be so loose that they must necessarily hang in loops from the supporting wires and be successively laid down upon the ground immediately in front of the tread of the tire. There is nothing in the prior art requiring such a construction, and, if adopted by the court, it will enable any chauffeur who has wit enough to contract the circumferential support so that the cross chains are drawn more tightly across the tire, to evade the patent with impunity. "Loosely" is here used in contradistinction to "tightly" and means that the cross chains must be sufficiently loose to secure the advantages of the invention; viz., to creep and not pound the road as they would do if rigidly fastened to the wheel, when travelling at a high rate of speed.

That the defendant's grip creeps is expressly admitted, as is also the contention that if by use the cross chains become loose so that they are free to move or shift their position around the periphery of the wheel, the device becomes an infringement. It is also clear that the defendant's device may be so adjusted that the chains are held loosely, and if the driver of the car becomes satisfied that the best results can only be attained by a loose adjustment, it is more than probable that he will adopt that method. In other words, the defendant places in the hands of the chauffeur an apparatus which may infringe or not, according to whether it is wound up loosely or tightly. When the defendant sells a device, the natural, usual and preferential use of which constitutes an infringement, it is no answer to assert that it is possible, by limiting its efficiency, to use it innocently.

We cannot avoid the conclusion that the changes made by the defendant are attempts to secure the fruits of Parsons' invention by alterations in non-essential details.

The history of the protracted litigations shows that, with few exceptions, the courts have regarded the Parsons invention as a meritorious one and have given it a construction sufficiently liberal to include all changes of form which accomplish the same result in substantially the same way.

The defendant was practically selling the patented grip in all its essential details, but in addition it provided tension springs with directions to make a tight fitting grip. The springs may or may not be used, and the directions may or may not be followed, but even if they are followed, the same result is obtained, only in a less degree; the circumferential creeping of the cross chains is not so marked.

Believing the invention to be a meritorious one, we decline to limit the claims as practically to invalidate the patent.

MILLER SUIT WITHDRAWN.

Because of the prominence of the defendant, Chas. E. Miller, 97-103 Reade street, New York City, who has been engaged in the automobile accessory business, as manufacturer, exporter, importer and jobber for 16 years, being in fact the pioneer accessory house in America, the action of the Lovell-McConnell Manufacturing Company, Newark, N. J., against this concern, asking for a preliminary injunction restraining it from dealing in Klaxon horns, is of decided interest. Inasmuch as Miller has 15 stores in eight states throughout the country, the outcome of the suit is of far reaching effect.

Miller also handled Newtone horns, made by the Automobile Supply Manufacturing Company of Brooklyn, N. Y., and it was claimed by the Klaxon people that this device infringed theirs. The action was brought on the ground that Miller's position as representing both horns was in violation of the conditional license granted by the patentee. After it was brought, much correspondence passed between Miller and the Lovell-McConnell company, as a result of which Miller declared the Klaxon product would be handled no longer under any condition.

When the matter came before the United States district court in New York City early in the month, the motion for the injunction was withdrawn by the plaintiff. Arthur W. Weil, Miller's attorney, states that this action was voluntary, after the defendant announced it was ready to argue the motion.

JOINS MICHIGAN FORCES.

W. H. Cameron, for four years chief engineer with the Willys-Overland Company, Toledo, O., has accepted a similar position with the Michigan Buggy Company, Kalamazoo, Mich., maker of Michigan cars. Mr. Cameron is well known throughout the entire industry as one of its foremost engineers and designers.

In 1902 he was with the Daimler Automobile Company of Long Island City, N. Y., a concern that was at that time engaged in the production of the American Mercedes. From that position he joined the forces of the Packard Motor Car Company, about the time it was building its Detroit factory. In 1904 he went to the Olds Motor Works in Detroit, and when that plant was removed to Lansing, Mr. Cameron went to Indianapolis to take charge of the automobile work of the Nordyke & Marmon Company. Two years and a half later he became associated with the Gibson Company of Indianapolis, and joined John N. Willys in the manufacture of Overland cars in 1908.

W. H. Cameron, Chief Engineer, Michigan Buggy Company.

Under Mr. Cameron's guidance the plans for enlarging the production of Michigan cars will be put into effect at once. These plans are the result of the Michigan car's remarkable success in the market during the past three years; in fact, since the first car of this make was duly announced. With the Michigan Buggy Company's large resources, its live, progressive policies and its immense factory facilities, Mr. Cameron has an unexcelled field for his future work.

CORRECTION OF ERROR.

In the last issue of The Accessory and Garage Journal, announcement of the election of officers for the Croxton Motor Company, Cleveland, O., was made in which there appeared a decided error. The correct list is as follows: President, J. P. Stoltz; vice president, Charles H. Stevens; treasurer, O. A. Peters; secretary, I. Zimmer. All of these, with the exception of the secretary, and J. R. Stoltz and C. Cosgray, are directors.

MAGNETOS FOR GAS ENGINE SERVICE.*

Principles Involved in the Design of Standard Instruments, Features of Construction and Conditions Essential to Efficient and Continued Operation of This Generally Adopted Source of Electric Energy.

(Continued from May Issue.)

The machine shown at Fig. 39 is the six-cylinder type recently produced by the U & H company, and as will be evident from the view of the exterior of the device shown at A, the machine can only be distinguished from the single sparking types by the additional pair of magnets and the double distributor block. The double armature is shown at B, and is to all intents two shuttles bolted together with separate high-tension collector rings, one at each end but having a common condenser, the brass case of which serves as a rigid coupling between the two members. This is earthed or connected to the ground by a carbon brush carried in the cover plate above the armature tunnel. One end of each primary winding is grounded in the ordinary way, but otherwise the windings on the two armatures are entirely distinct.

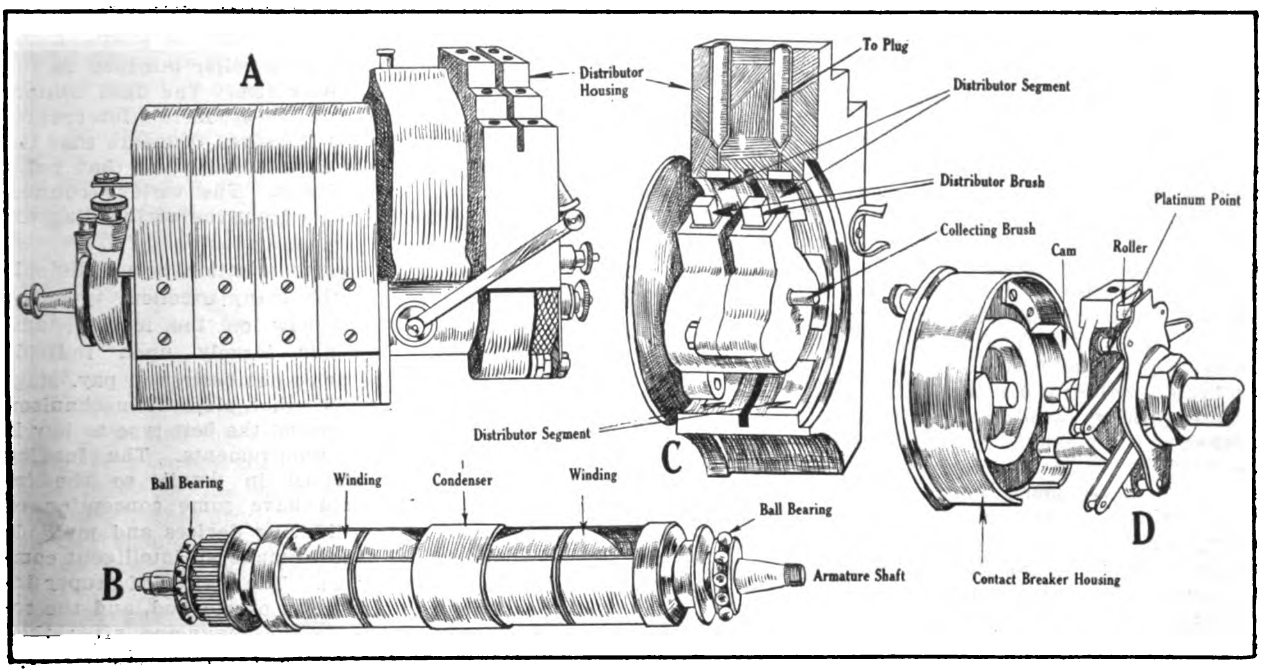

Fig. 39—Features of the U & H Double Magneto, Which Practically Consists of Two Instruments Coupled Tandem.

At the driving end, distinguished by the tapered shaft, the high-tension current is collected and delivered to its particular distributor brush by a carbon pencil and a bridge piece passing to the distributor underneath the magneto arch as in the conventional types. At the other end the collecting ring supplies current to the brush by the brush let into the side of the armature tunnel extension, and this is connected to the distributor by an external lead communicating with the brush in the vulcanite distributor cover.

The cross section of the distributor is shown at C and requires but little explanation, being merely two entirely independent brush carriers mounted on a common shaft and set on the same plane, the distributing brushes each engaging their respective set of brass segments in the outer case. The double contact breaker is shown at D; this is practically the same as the single contact breaker used on the U & H machines except for the addition of another pair of platinum contact points. One pair of these is grounded, the other two are insulated and are carried in a plate fulcrumed at the bottom. The points are forced apart by cams in the contact breaker cover acting against the member carrying the insulated pair of platina by a loose roller carried in a box at the top of the main body.

As the platinum points are separated simultaneously, and the armature shuttles and windings reach the position of maximum current strength at the same time, it is evident the sparks will occur at precisely the same instant in the cylinders. Thus on a T head motor, for instance, one could place one spark plug in the inlet valve cap, the other over the exhaust member and the charge would be kindled from two points instead of one, as in the single spark system. The flames would then travel toward the common centre, whereas with a single spark, the single flame would have to travel the entire distance across the top of the combustion chamber before igniting the gas at the other side, this producing lag which might affect the engine's efficiency at high speed.

The K-W arc flame magneto differs from the types previously considered in that there is a stationary coil, the armature member consisting of a pair of inductors revolving between the pole pieces and in the magnetic field created by the large permanent magnets. The details of construction can be easily grasped by referring to Fig. 40, the principal members being clearly shown in the longitudinal section, while the arrangement of the distributor and contact breaker is outlined in the end elevation. The method of current production is similar to the inductor magneto previously described, except that the stationary coil has two windings, a primary and secondary, the high-

---

tension current being produced directly in the winding instead of in a separate transformer coil.

The only revolving part is the rotor, which is constructed of two members made of many fine laminae of soft Norway sheet iron riveted together and accurately fitted to the rotor shaft. These are mounted at right angles to each other. The winding, which is concentric with the rotor shaft, is mounted between the two halves of the rotor and is stationary. These revolving inductors collect the magnetism from one pole piece and conduct it through the centre of the winding to the pole piece of opposite polarity, thus giving a powerful wave of current from a quarter revolution of the rotor shaft.

The primary winding goes through the circuit breaker of the magneto, as in conventional forms and the interruption of the current by the separation of the points takes place when the induced energy is at its maximum value. The current from the secondary winding goes straight up through the hard rubber terminal to the bus bar which conveys it to the centre of the distributor, the revolving member selecting the various segments to which the spark plugs are connected as it turns.

The circuit breaker parts are mounted in the contact breaker housing, the points being separated by the direct lift action of a hardened steel cam carried by the rotor member raising a roller attached to the grounded contact point lever arm. The fixed contact point is insulated from the rest of the interrupter parts and can be adjusted if desired to insure that the gap between the points is maintained to that point making for highest efficiency. The various connections can be followed easily from the wiring diagram at Fig. 41.

Fig. 41—Diagram Showing Wiring of K-W Magneto.

The problem of magneto selection is not difficult of solution because of the many excellent types of these current producers now on the market, and the type chosen depends largely upon individual preference and the price one desires to pay. Magnetos, as is true of every other piece of mechanism, differ in quality and finish and the best type to buy is governed also by the requirements. The leading forms have been described in detail, so the intending purchaser should have some conception of the advantages of the differing devices and methods of operation, and be able to make an intelligent comparison between the types. The matter of proper installation is one that is often overlooked, and the repair and maintenance of the magnetos after they have been in use for some time should also be considered because of its importance in obtaining efficient and satisfactory service.

In fitting magnetos there are several points to be observed, the most important being the placing of the device and the method of drive. These are closely related to each other; in fact, the location of the generator with reference to the other members of the power plant is largely governed by the method of operating chosen. Such appliances should be placed in as accessible position as possible, so the contact breaker and the distributor is handy for immediate inspection or adjustment. It should be placed on the inlet side of the engine and as far away from the carburetor as possible. When the design of the engine is such that the exhaust manifold is carried high, the magneto may be installed on that side of the motor. If placed too near the exhaust piping, the great heat is liable to injure the magnets and insulation of the windings. It should be attached firmly to a base of non-magnetic material by a strap or stirrup of similar substance, so that there will be no passage of magnetic lines of force except through the core of the armature shuttle.

Direct gear drive is to be preferred to chains and spur gears are to be advised in preference to worms or mitre members. The reason for the selection of a positive means of driving is that the spark must be timed to occur at a certain point in the engine cycle, and as the timing device is included in the magneto, if this were operated through some form of flexible drive, such as a belt, the spark time might vary within wide limits as permitted by the slip of the driving members on its pulleys. Then again, one should use as few gears as possible, as after a time the driving means may wear and the magneto will not be in absolute synchronism with the engine, thus reducing efficiency. As direct spur gearing with helical teeth is the best wearing method of power transmission, especially if well housed and properly lubricated, these are used whenever possible. Bevel gears are more satisfactory than either chain or worm drive. The less the number of gears in the train, the less the liability of backlash and lost motion through wear of the teeth.

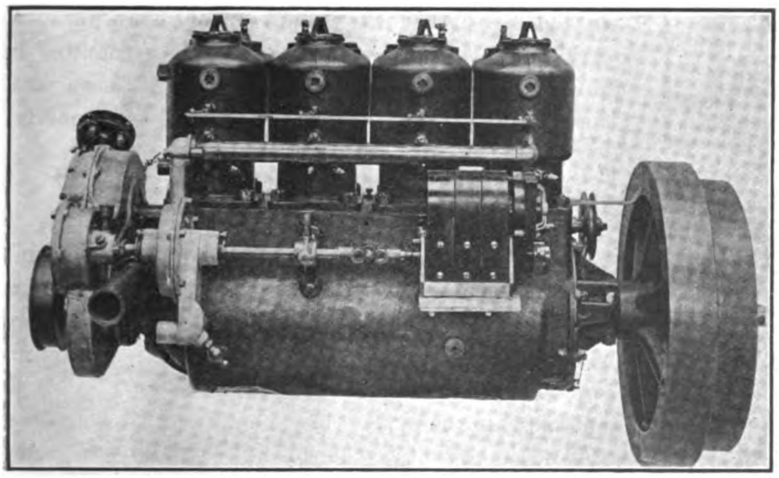

Fig. 42—Magneto Installation on Rambler Motors.

Magneto driving gears having 12 pitch teeth will be found strong enough to drive the armature without undue wear and this size is recommended rather than larger teeth because the greater the number of these in the engagement, the easier it is to time the armature accurately. When driven by shaft some form of Oldham coupling should be interposed between the armature driving end and the driving medium in order that any slight inaccuracies in the driving shaft will not impose undesirable stresses on the bearings by which the armature is supported.

Typical Methods of Magneto Mounting.

The location of the magneto and the methods of driving vary in nearly all automobiles, and, of course, the design of the engine has material bearing upon the placing of the igniter and wiring. The engine shown at Fig. 42 is one used on the Rambler. In this, the magneto is placed at the left side, between the third and fourth cylinders, and is bolted to a cast bracket attached to the engine base. The pump shaft is extended through the casing and is supported by a plain bearing near the forked member of the driving clutch. A similarly formed piece is attached to the magneto armature and the two are joined by a coupling member. Another example of driving by long shaft is shown at Fig. 43. In this case the magneto is applied to the engine used in the Regal automobile. Instead of being operated in connection with the pump as in the previous instance, as no pump is employed on the Regal motor, the magneto is driven by a gear the same size as that on the engine shaft, which is turned by the camshaft speed reduction member. The generator is supported on a bracket cast integral with the engine base and is retained by machine screws threaded in from the bottom.

(To Be Continued.)

CHEMICAL ACTION IN HIGH-TENSION WINDINGS.

The subject of chemical action in high-tension windings was discussed recently by a body of English engineers. It was found by experiment that none existed unless the voltage were higher than 3500, and then it occurred only where there were air pockets present. The action was initiated by a discharge across the air space, producing ozone and nitrous or nitric acid. This gas acting upon the insulating material, caused disintegration. Oils and gums of varnishes were oxidized, but asphaltum was not seriously attacked. Mica was not affected at all, but the gas injured the cement used. The tests showed that if the air in the pockets were not replaced the chemical action ceased.

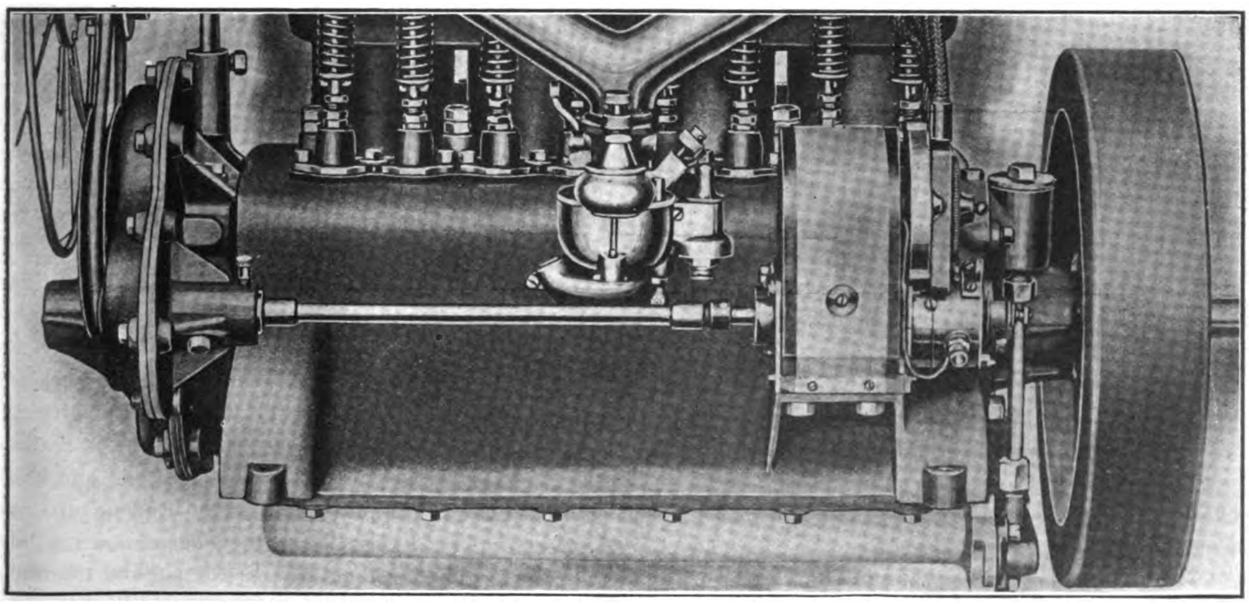

Fig. 43—How Magneto Is Placed on Regal Engines and Method of Driving This Instrument by Long Shaft.

CONTRIBUTIONS:
Anonymous communications not considered. Correspondence on subjects relating to the motor industry and the trade will receive attention. Stamps must be enclosed to insure return of unsolicited contributions.

ADVERTISING:
Information supplied at request.

Advertising Copy for the ACCESSORY and GARAGE JOURNAL requiring submission of proof must be received by 5th of month to insure publication in issue of the 15th of month.

Advertising Copy, proof not required, accepted to morning of the day before publishing day (unless such day is Sunday or holiday, when previous day is limit) of each publication.

Remittances should be made by Check, Draft, Postoffice or Express Money Order, or Registered Letter. Money enclosures must be at sender's risk.

SYSTEM IN GARAGE MANAGEMENT.

Attention to detail insures perfected work; the same policy applied to accounting makes certain the profit. Conducting a garage, or any other business, without a system is at parity with navigating without a compass. Any person can guess, and perhaps occasionally hit the mark. But the judgment of the wise man—wise because he knows—is respected. It is unusual for a man to engage in any work without knowing what his return will be, yet thousands enter business without having anything more certain than the traditional barn door ledger of the farmer. Accounting may appear a burden because it means record, but every leak is a loss for owner or manager. Such losses cannot be recovered. They are as beyond recovery as is yesterday. System is not a hardship. It is an insurance of profit, because work will not be undertaken that is not profitable. Its protection differentiates between success and failure. There are few men who would not gladly pay for a guarantee of business prosperity, yet many will reject a system, no matter how effective it may be, because they assume an added cost that will cause economy is an unnecessary expense. Some profess to believe accounting is only necessary when it is wanted. So it is, but a sane business man wants it always guarding his property.

PLANS FOR 1913 BUSINESS.

Without exception every concern engaged in manufacturing motor vehicles has made or is making its plans for the business of 1913. Many have already placed orders for material which will permit a considerable increase of production. It is not possible to approximate the proportion of industrial development. But it can be said that it will be very large with some concerns, notably those producing the popular or low priced pleasure cars, and practically every maker of service wagons is preparing to meet a demand that is estimated will be several hundred per cent. larger than this season. It is hardly necessary to state that this expectation of business, and every conclusion is based on reasonably certain information, will have its influence with every allied industry, with every firm in the trade, with every garage or public service station, and with every repairing shop. Without exception there will be expansion of facilities for manufacturing, for distributing, for selling and for care and maintenance, while the demands for service wagon attention will be relatively as large as the production of the factories. The outlook is unusually good and there are apparently no limitations to the possibilities for the industrial vehicle market.

OPPORTUNITIES FOR FOREIGN TRADE.

The opportunities for foreign business are such that every progressive manufacturer of either pleasure or industrial vehicles should seriously consider them. The fact that American machines have given excellent satisfaction wherever used abroad is one of the strongest arguments in their favor that can be made, because, after all, service is what is required. Vehicles made in this country have a relatively greater endurance in European use because of the decidedly better highways, and are really as cheap as here, despite the import duty, when measured by mileage travelled. The American automobiles have undoubted merit, and should be decidedly attractive to foreign buyers, but one of the greatest handicaps in the past has been the lack of branches to afford attention to customers and the length of time necessary to negotiate with the maker in the event of need. This has been realized by those who have investigated conditions and those who are exploiting the markets of Europe are prepared to give an attention to their customers that will at least equal that given by the English and Continental manufacturers.

GRAMM'S FUTURE PRODUCT.

B. A. Gramm, Designer, Gramm Motor Truck.

When announcement was made recently that John N. Willys, president of the Willys - Overland Company, Toledo, O., had purchased the controlling interest in the Gramm Motor Truck Company, Lima, O., it was stated that B. A. Gramm, who designed the Gramm truck and built up the business, would be associated with him in perfecting the details of the new organization. Mr. Gramm now explains that such was his original intention, but upon more mature reflection he has decided that this should prove an opportune time for him to bring out some new designs, which he believes will reflect the standard of the future in truck construction.

It is understood that Mr. Gramm has secured a new factory in Lima and that he has associated with himself a strong organization, which will proceed with plans for the production of new models. These are to be worked out thoroughly and given every test before being placed before the public. Beyond the bare information that the new trucks will be simple in design and construction, with few working parts, accessible in every detail and embodying features of comfort for the driver, absolutely nothing is known concerning them. Additional news concerning the factory and the product will be awaited with interest by those in the industry.

IMPORTANT MEETING CALLED.

A meeting of the directors of the United States Motor Company, New York City, selling organization for the Columbia, Maxwell, Stoddard-Dayton, Brush and Courier pleasure cars and Sampson trucks, has been called for the purpose of taking action on a proposition to issue $4,000,000 of five-year serial bonds, convertible into common stock at par and bearing six per cent. interest. These debentures would be a portion of the $6,500,000 still in the company's treasury out of the $12,500,000 authorized a year ago.

It is understood that the company is in need of working capital since it is necessary to finance the coming season's output before completely disposing of the 1912 product. An official of the company is authority for the statement that the concern is in better condition than at any other time in its history, insofar as the relative values of the assets and liabilities are to be considered. With the question of working capital settled, there seems reason for believing that the present difficulty will be entirely overcome.

INTERESTING DECISION.

The Massachusetts supreme court has made a decision in the case of Lauritz F. Rasmussen against Amos H. Whipple for the death of a newsboy from injuries alleged to have been inflicted by the defendant's automobile in Mattapan, April, 1907. The full court upholds the verdict of the lower court, giving $2000 to the plaintff. In its ruling, the court says:

"Every person operating a motor vehicle on our ways must run it at a rate of speed that is 'reasonable and proper, having regard to traffic and the use of the way and the safety of the public.' There was testimony that the signal horn was sounded, but it was not heard by a number of witnesses to the accident, and under the circumstances the jury could infer that it was not sounded loud enough or sufficiently near the place of the accident to give timely warning. Nor is it contended that even the loud blowing of a horn would give to the motor vehicle any exclusive right of way or relieve the driver from the duty of proceeding at a reasonable rate of speed and of keeping his car in control when approaching a busy thoroughfare."

REMY SALESMAN'S SUCCESS.

The accompanying illustration is that of A. J. Rogers, who was recently placed in charge of the Remy magneto branch at 170 Golden Gate avenue, San Francisco. His territory will include the entire Pacific Coast, and his success with the sale of Remy products in other capacities, is sufficient guarantee that the business of the concern in that district will show a marked increase at once.

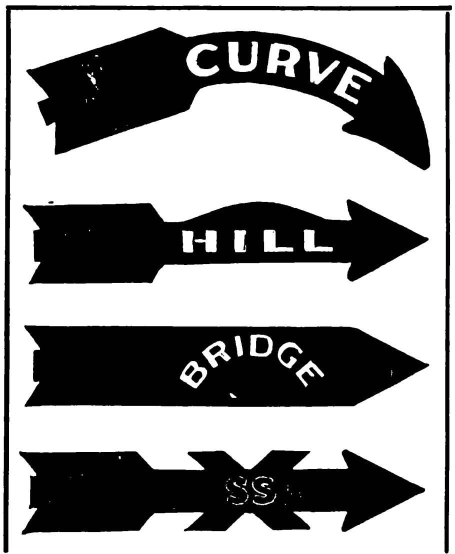
Mr. Rogers is well known through the Middle West and South, having been connected with the sales department of the Remy Electric Company, Anderson, Ind., for some time. Inasmuch as the home office is continually seeking men for the large number of factory branches and service stations it is establishing throughout the country, it follows that his work has been watched with interest by his superiors.

The San-Francisco branch is one of the most important in the country. The sale of Remy magnetos and other ignition and lighting equipment in this district has been increasing very rapidly of late and it was deemed best to select a man for branch manager, who had given ample demonstration of his ability. That Mr. Rogers measured fully up to this standard is a source of much gratification to his many friends, both in and out of the industry.

A. J. Rogers, Branch Manager, Remy Electric Company.

HARRIS OIL ROAD SIGNS.

A road posting campaign, which is bound to result in decided benefit to motorists and all others concerned, has been inaugurated by the A. W. Harris Oil Company of Providence, R. I., maker of the famous Harris oils for all forms of automobile, motorcycle, motor boat, and aeroplane lubrication. The plan is so unique that it merits more than usual mention. Some of the signs are presented herewith, but as they are handsomely lithographed in red, yellow and black, on substantial metal, these black and white reproductions hardly do them justice.



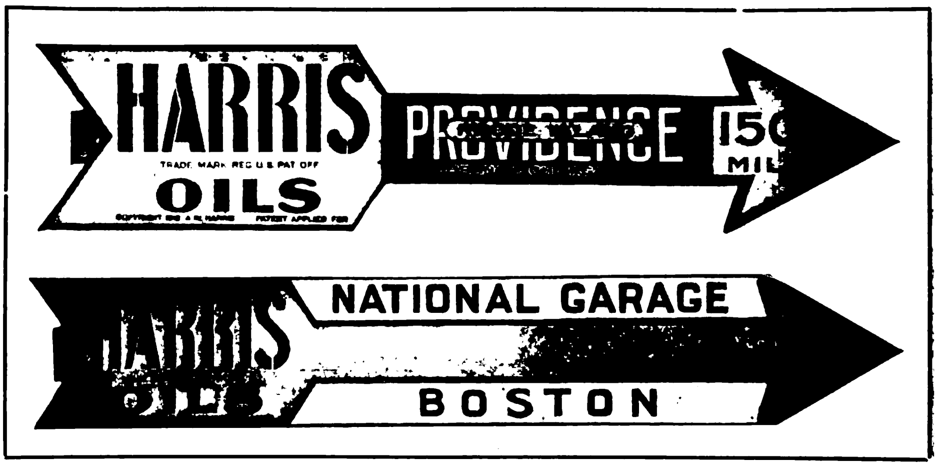
Harris Oil Signs—Symbol Arrows for Warning Motorists of Danger.

As will be noted the entire set includes master arrows, dealer's arrows and symbol arrows. The Harris company has applied for a patent and the signs are all copyrighted. The working of the plan is very simple.

The dealer's arrow, or as it is termed, the local wedge arrow, bears the dealer's name and the town with the mileage, and is designed for the purpose of informing motorists where supplies may be obtained. The master arrow gives directions and mileage to the larger towns and cities on the route, while the symbol arrows will prove of decided assistance to motorists in giving ample warning of approach to dangerous spots along the road. Inasmuch as all the signs are of long wearing material, the service will be permanent and of an enduring character.

This splendid advertising proposition is open to all dealers, the A. W. Harris Oil Company bearing the entire expense. Those dealers interested will be supplied with a sufficient number of signs to meet their requirements. The plan is decidedly comprehensive and should prove of material assistance to the motorist, the dealer and the Harris concern.

The arrows are now being sent out and the demand from dealers is growing rapidly. The reputation of Harris oils is well known, and it is anticipated that this new advertising plan will assist in bringing it to the attention of tourists. This is an exceptionally good time to begin the work of installing the signs along the roads travelled by motorists.



Harris Oil Signs: Above, Master Arrow; Below, Dealer's Arrow with Information as to Where Supplies May Be Secured.

NEW CONCERNS IN INDUSTRY.

Several new concerns have been organized for the purpose of constructing mechanical transports, and in one or two instances it is noted that well known wagon makers are taking up the manufacture of motor driven equipment. Among the latter may be mentioned the Geneva Wagon Company of Geneva, N. Y., which has held an enviable position in the older industry for a number of years. This concern will produce but one chassis, to which two types of bodies will be fitted, one having a capacity of 2100 pounds and the other 2300.

The F-S Motors Company has been organized in Milwaukee, Wis., for the production of a new light delivery car to be known as the F-S. It is understood that the backer is the Filer & Stowell Company of that city, which already owns a controlling interest in the Beaver Motor Company, the Petrel Motor Car Company, and other important concerns in that vicinity.

The Driggs-Seabury Ordnance Corporation, which is more or less well known through its connection with the parts industry, has been engaged in the construction of 20 motor trucks, which will soon make their preliminary tests. Three models will be produced, in capacities of three, four and seven tons, respectively.

A new concern has been organized in Clyde, O., to be known as the Krebs Motor Truck Company, for the purpose of manufacturing the Krebs truck of 1500 pounds capacity. It is understood that the motor will be a two-cylinder, two-cycle unit with bore of 4.5 inches and stroke of 5.5.

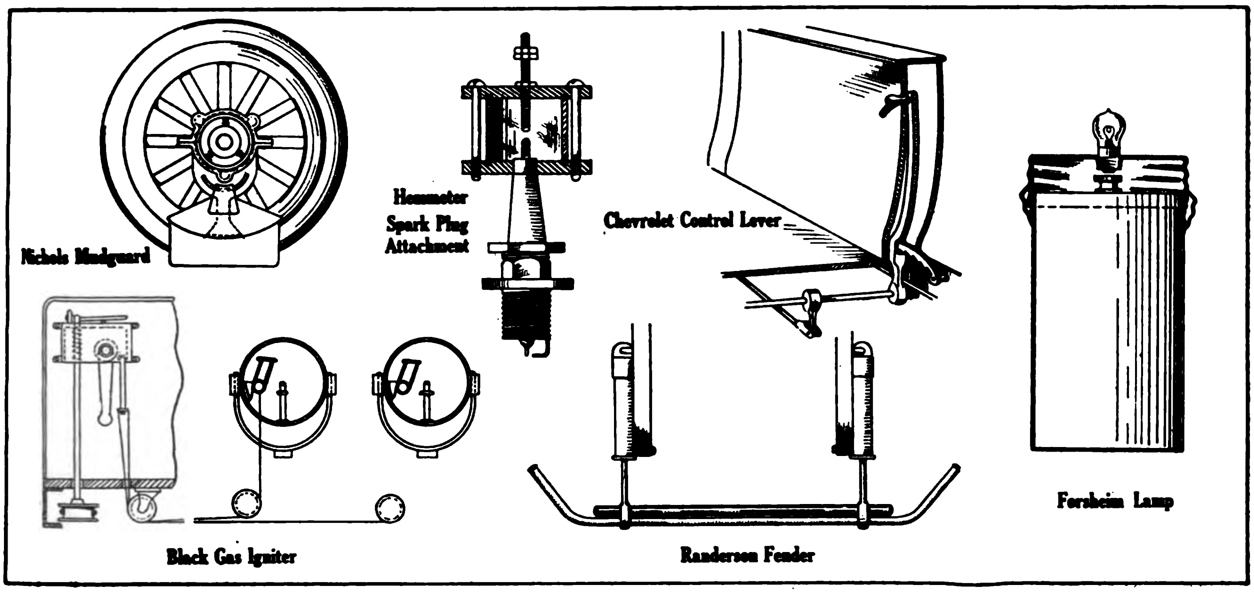
A. B. Perkins, his three sons, and G. E. Porter of Bay City, Mich., have organized the Wenonah Motor Truck Company, which will place in the market the Wenonah truck in two models, one of 1000 pounds and the other of 1500.

The Ewbank Power-Transmission & Motor Company, Portland, Ore., which was organized in December, is about ready to present its truck, and it is said that other products will include motor propelled fire apparatus and railway equipment. The basis of the new vehicle is a gasoline-electric traction system designed by H. B. Ewbank, Jr., which involves the use of separate driving motors for each rear wheel, speed control being accomplished through the regulation of the engine. The officers of the company are: President, S. M. Mears; vice president, George W. Stapleton; treasurer, R. S. Howard; secretary, Dr. H. B. Ewbank; chief engineer, E. H. Ewbank, Jr.

RECENT PATENTS of INTEREST

Hemmeter Spark Plug Attachment.

An attachment for a spark plug has been patented by Henry C. Hemmeter, Pontiac, Mich., assignor of one-half to Cassius C. Van Wagoner of the same place. It differs from the usual spark gap device inasmuch as it is attached to the plug itself and means are provided to prevent the spark from igniting any gasoline vapor which may be in the vicinity of the flame. The device comprises two circular plates of non-conducting material and these are recessed to take a glass tube. The parts are held securely by screws. The lower insulated plate is fitted over the binding nut of the electrode from which the terminal is removed in practise. The upper plate carries an adjustable threaded member and when a space is left between it and the regular electrode, the spark will jump across the gap. It is claimed by the inventor that the action of the current may be noted readily and that any soot or oil between the points of the spark plug will be removed by the device. Means are provided for fastening the attachment to the spark plug.



Outlining Some of the Recent Ideas of Inventors of Parts and Accessories Applicable to the Automobile, Including Control Lever, Fender, Electric Lamp and Gas Igniter.

Nichols Mud Guard.

There has been considerable agitation abroad regarding the splashing of mud upon pedestrians by the wheels of motor cars and the subject has received some attention in this country. Charles Hillyard Nichols, Wolverton, England, has patented a mud guard which is attached to the hub of the road wheels, this consisting of a ring having adjustable means incorporated and interposed between it and the hub of the wheel, also a method of retaining these in this position. A rotating ring is mounted upon the first and attached to this is a weight which keeps the guard in normal position. It is claimed by the inventor that any mud or water splashed by the wheel will strike the guard and be deflected inwardly toward the wheel.

Black Gas Igniter.

In these days of refinement considerable attention is being paid to devices which will control, light and extinguish acetylene headlights from the seat. Allen G. Black, Springfield, Mass., has patented a gas controlling and lighting apparatus for motor cars which is operated by a handle or lever convenient to the driver. The gas tank is fitted with a valve having a rotative stem and another similar wheel is attached near the front seat. These members are connected and operated by a cord. The latter is actuated by a lever or shaft by means of which the flow of acetylene is controlled. The lighting device consists of a spring wire, the middle portion of which is coiled, while its extremities are approximately parallel. These ends are fitted with means for igniting the gas, combustion taking place when one of the pivotally mounted legs is actuated. A retracting spring is provided to return the device into its normal position. The other leg is connected with the controlling mechanism and means are incorporated for operating the cord.

Chevrolet Control Lever.

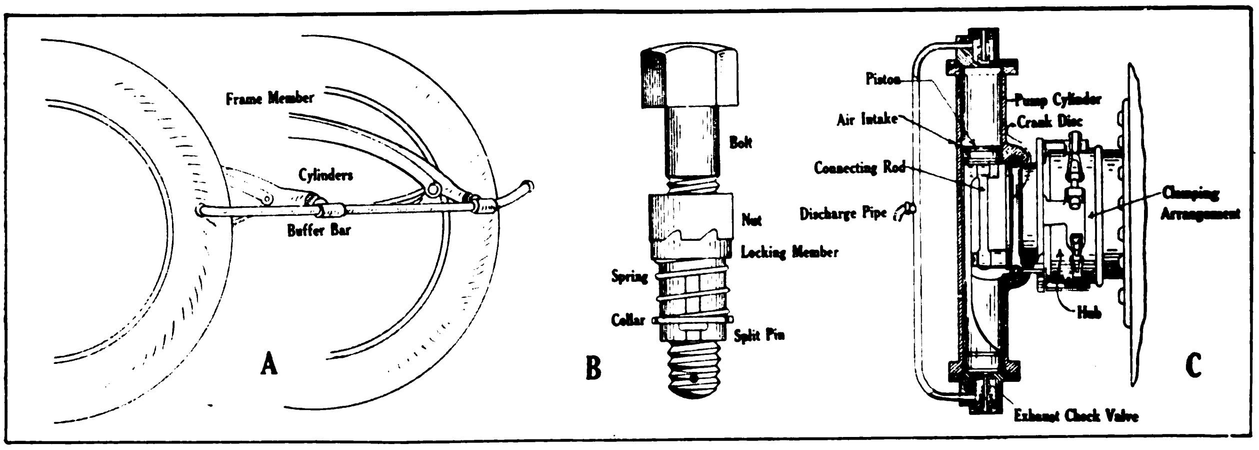
Louis Chevrolet and Etienne Planche, Detroit, assignors to the Chevrolet Motor Company of that city, have been granted a patent for a control lever which is unique in its location, inasmuch as only that portion grasped by the hand is in view. The device consists of a false door formed with an inner and outer wall in which space the control lever is concealed, as is the gate or quadrant. The lever is curved to conform with the shape of the fore door and is operated by means of a horizontal handle extending inwardly through a curved slot. It is claimed by the inventors that concealing the lever not only improves the appearance of the car but inside control is obtained without interfering with the comfort of the operator or occupant of the other front seat. It is also pointed out that the member is less likely to be tampered with when the machine is left unattended on the street.

Randerson Fender.

Letters patent have been granted to John P. Randerson, Albany, N. Y., for an automobile fender in which is incorporated means for not only resisting the shock of compact but taking care of the recoil. Two fender bars are utilized, these being similar in construction to the usual devices of this nature. These rods are supported by hinged members, extensions of which are fitted to tubes containing cushioning springs. The spring carrying members are fastened to the vehicle. When the fender comes in contact with an object it is claimed by the inventor that the springs absorb the shock and eliminate any danger from recoil.

Forsheim Electric Lamp.

Joseph Forsheim, New York City, has been granted a patent for an attachment to a dry cell which presents practical features, inasmuch as the device is simple and attached easily. It consists of a cap or casing having spring like retaining arms and so arranged that the terminals of the positive and negative poles come in contact with similar members of the device. Means are also incorporated whereby the supply of current may be cut off as desired. The electric bulb is screwed into the top of the casing and when the components are assembled the dry cell may be utilized for an inspection lamp and for other purposes as well. The inventor points out that with his device a motorist may utilize one or all of the dry cells in the car for lighting purposes whereas with the ordinary inspection lamp with battery self-contained, the service is limited.



Novel Inventions of Interest to Those Identified with Motoring.

NOVELTIES AND ODDITIES IN INVENTION.

Among the recent inventions for which patents have been allowed there are a number of distinct interest to motorists. The device in sketch, at A, is a vehicle fender in which the buffer rod is provided with pistons sliding in special cylinders intended to fit over the front frame members. This is an advantage over the usual manner of installation, which calls for a removal of the spring supporting bolts to install the conventional type of fender. The fender is carried higher than in the ordinary applications, the springs may be made larger and stronger, the device is neater and the thrust is taken at a point well adapted to resist it, the point of juncture of both spring and frame member. Oscar C. Graff of Chicago, Ill., is the inventor.

A Nut Lock of Merit.

The nut lock shown at B is slightly more complicated than the simpler forms of spring washer or castellated nut, but should prove useful in many applications. The nut is provided with a number of serrations adapted to engage with the corresponding set on the locking member. This is a slotted cylinder sliding over the thread of the bolt, being kept from turning by a pin passing through the bolt and slot. The tension of a coil spring between a collar held by the pin and the locking member keeps the teeth always in engagement with those of the nut and prevents this member backing off. If one desires to screw the nut up, however, it may be done in the usual manner with a wrench, the teeth of the locking member limiting movement in but one direction. The disadvantage of this construction is that a bolt must be longer than with either a castellated nut or spring washer, though not much longer than if a nut and check nut are employed. This locking arrangement has been devised by Burton D. Lodge, Magnolia, Del.

Tire Pumping Attachment for Wheel Hubs.

A novel tire pumping attachment for automobiles has been devised by Oscar M. Bergstrom, Minneapolis, Minn. This consists of a cylinder having a discharge check valve at either end, these being coupled to a common lead, in which a double piston is operated by a crank. The latter is turned by a fitting intended to be temporarily attached to one of the driving wheel hubs. The cylinder is mounted on a flange which runs on ball bearings and is held rigid while the wheel is turned. Air enters the cylinder through the ports uncovered by the piston at the bottom of its stroke, and is compressed and discharged through the air valve in the cylinder head. The driving flange is provided with a series of flexible arms, with a chain and screw clamping arrangement, so it will fit a variety of hub caps without change. The method of application and the parts of the device are clearly shown in illustration, at C.

ANNEALING BOX FOR SMALL PARTS.

An annealing box for small parts can be made easily in the following manner: Take a piece of three-inch iron pipe about 10 inches long, tap both ends and fit plugs. One end of the tube is closed and the charcoal and parts to be annealed are packed in, after which the other plug is screwed in. With a box of this kind sealing is not necessary, as the screw plugs will prevent the entrance of air.

When a paper gasket will not prevent oil or grease from leaking, owing to the edges of the case being sprung, a paste composed of litharge (fused oxide of lead) and glycerine will fill the space and stop it. This mixture is often used in the pipe joints of underground gasoline systems.

MECHANICAL POINTERS for GARAGEMEN AND OWNERS

FORD IGNITION AND ADJUSTMENT.

It is surprising to note the large number of owners of the model T Ford who fail to obtain the maximum efficiency from the motor because of a lack of practical working knowledge of the ignition system and an inability to adjust the coil properly. The writer has noted from time to time, that many new operators, and even some with experience, rely upon the agent or salesman to tune up the coil, a task that may be performed by the owner if he understands its principle and application in practise. Frequently the failure of the car to operate smoothly is due to one or more of the coil units not being synchronized with the others, or to causes which will be outlined herein. In order to overcome ignition troubles the driver should understand the operation of the system which will be explained in non-technical language for the benefit of the novice.

Operation of Motor.

The explosive mixture is introduced into the cylinder by the suction of the piston when the latter is moving downward, a movement known as the intake stroke. The next half-turn of the crankshaft carries the piston upward, compressing the gas. This is the compression stroke. The remaining two strokes are firing, a downward movement, and exhaust, an upward stroke of the piston. Those strokes should be borne in mind as they are important in timing the ignition should it be necessary to remove the commutator.

Two valves are fitted to each cylinder, an intake and an exhaust. The former is located easily, being that member in line with the spark plug. The intake valve begins to lift when the piston is moving downward on the intake stroke, and remains open until the movement is nearly completed, and is closed during the succeeding, or compression stroke. The exhaust begins to open slightly before the power stroke is completed.

The cylinders fire 1, 2, 4, 3, and when the piston of the No. 1 cylinder is at the top of its stroke, those of the Nos. 2 and 3 are at the bottom while the No. 4 is at the top. In order to facilitate resetting the timer, the firing order and opening of the valves will have to be considered; that is, if the ignition is not timed by the piston, and the following table, giving the strokes of each cylinder in their respective order, will be of value:

Order of Firing.

Cylinder 1	Cylinder 2	Cylinder 3	Cylinder 4
1—Firing	Compressing	Exhausting	Intaking
2—Exhausting	Firing	Intaking	Compressing
3—Intaking	Exhausting	Compressing	Firing
4—Compressing	Intaking	Firing	Exhausting

When the piston of the No. 1 cylinder is at or near the top of the compression stroke, a spark is supposed to take place at the gap of the spark plug, igniting the mixture, producing a pressure against the piston and driving it downward. At the same time the piston of the No. 2 cylinder moves upward on its compression stroke. No. 4 cylinder is drawing in a charge, while the No. 3 is exhausting, as will be noted by the table.

A separate and distinct spark takes place in each cylinder in the following order, 1, 2, 4, 3. This is accomplished by a device known as the timer or commutator which is attached to the shaft operating the valves. This timer has four insulated terminals, each corresponding to the same numbered cylinder. The interior of the timer is fitted with a fibre ring, a non-conductor of electricity. Inserted in the fibre, 90 degrees apart, are metal blocks, the surfaces of which are flush with the fibre.

Attached to the camshaft is an arm carrying a roller, and both of these members rotate at camshaft speed, which is one-half that of the crankshaft. The timer proper is loosely mounted and may be moved in either direction for advancing or retarding the spark. It may be compared to a switch in an electric bell system. When the metal roller comes in contact with a metal block in the fibre, the primary circuit is closed and current will flow, but the connection will be broken when the roller comes in contact with the fibre. The roller rotates to the left, when facing the radiator, and makes contact with blocks, 1, 2, 4, 3, respectively, the firing order of the cylinders.

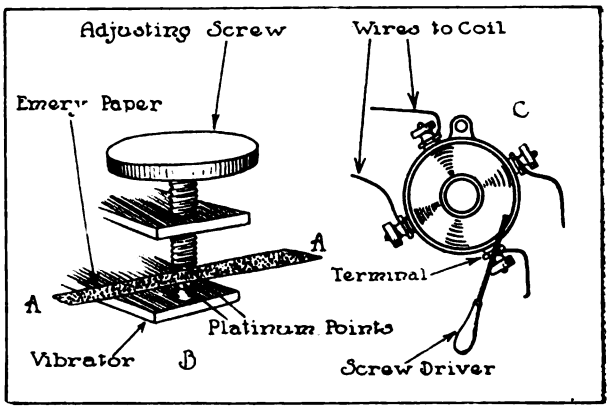


Fig. 1—Ignition Hints: B, Cleaning and Truing Coil Points with Emery Paper; C, Method of Testing Primary or Secondary Current with Screw Driver.

Function of Coil.

The magneto develops a low-tension current, and this electricity is built up or strengthened to force the current to jump across the gap of the spark plug. This is accomplished by the windings in the coil, a primary and a secondary, of coarse and fine wire, respectively. On the top of each unit of the coil is a flat strip of metal carrying a platinum point and directly over a core of iron wires. An adjusting screw is also fitted with a platinum point in contact with the other member. The coil also carries a switch which closes the magneto or battery circuit. It is explained that for electricity to flow a path must be provided for it to leave its source of supply, as well as one for returning. With the motor car but one wire is necessary as the metal of the frame, etc., is utilized as one lead and is known as the ground.

Direction of Current.

When the lever of the switch coil is thrown to "magneto," and the latter is operating, current is being developed, and a circuit is completed when a contact is made at the timer by the roller. The electricity then flows through the No. 1 wire, for example, on the timer. This wire is insulated and the current travels to the No. 1 unit of the coil where it is built up into a high-tension.

The vibrator is drawn down by the iron core or magnet, breaking the circuit, and for each contact of the platinum points a spark is produced at the gap of the plug. This secondary or built-up current is led from the coil by a heavy insulated wire to prevent leakage, and in reaching the plug passes down the metal electrode, which is insulated from the base of the plug and jumps across the gap to the shell. The latter being of metal and in contact with the cylinder, a return path is provided for the current by the way of ground or metal back to the generator or battery. Thus it will be noted that there are two circuits, a primary and a secondary.

Wiring Diagram.

The arrangement of the components of the ignition system is depicted at Fig. 2 A, which also outlines the timer. The sketch shows the connections of the coil on the back of the dash and it will be noted that these are numbered 1, 2, 3, 4, both for the primary and secondary wires. The leads to the plugs are similarly marked. It will be seen that the 1, 2 and 3 wires from the timer lead to the corresponding terminals of the coil, but that the third contact to be made at the timer is connected to the No. 4 terminal of the coil, this arrangement being necessary to bring about the firing order, 1, 2, 4, 3, as previously explained. The fact that No. 4 cylinder fires ahead of the No. 3 is confusing to the amateur in locating troubles and when it becomes necessary to rewire the timer.

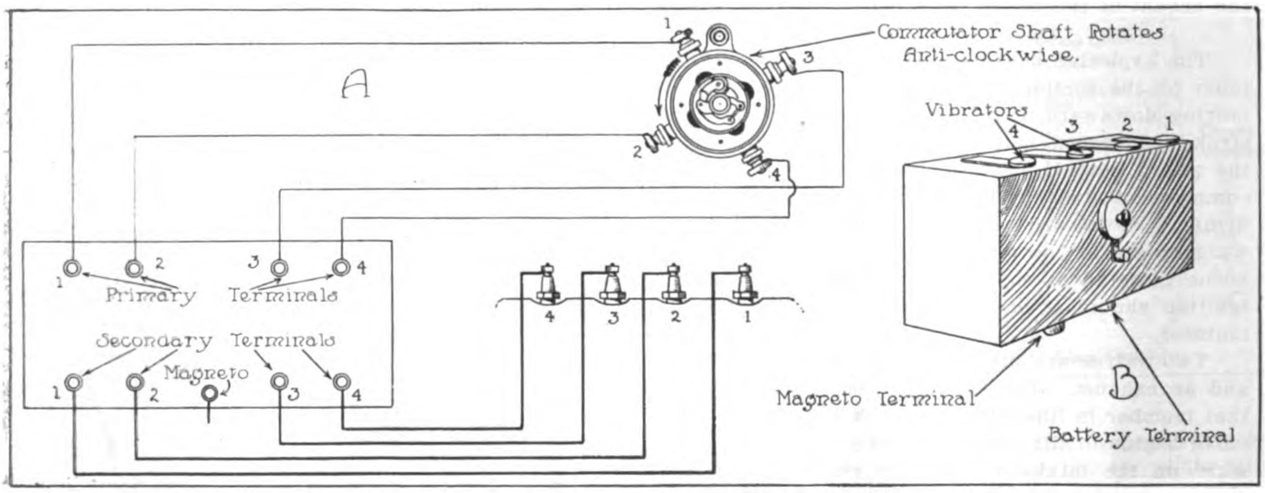

Fig. 2—Outlining Ignition System of Model T Ford: A, Showing Primary and Secondary Leads; B, Depicting Vibrators of Coil Corresponding to Numbered Spark Plugs.

Locating Missing Cylinders.

There are several practical methods of locating which cylinder is missing explosions. The coil may be utilized and B shows the vibrators, these being numbered 1, 2, 3, 4, corresponding to the plugs in the cylinders. The cylinder nearest the radiator is designated as the No. 1. By holding down with the fingers, vibrators, 4, 3, 2, with motor running, current will be cut off to all cylinders except the No. 1, and if the plug or coil be at fault the motor will stop. The other cylinders may be tested in a similar manner. If upon screwing down the adjusting member, the vibrator buzzes, the fault is likely to be due to the plug which may be examined and replaced by a new one if necessary.

Another method is to short circuit the plug with a screw driver, taking care to utilize a tool having an all wood handle, else one is likely to receive a shock. The metal of the instrument is used to make a connection between the cable terminal and some convenient metal of the motor. This should be done with the cut-out open so as to note by ear the explosions. The spark may be tested in a similar manner by holding the point of the screw driver about .25 or .5 inch away from the cylinders with the other part of the tool in contact with the cable terminal. Still another method, which is more troublesome, however, is to loosen the binding nuts of the spark plugs and take one wire at the time, holding it near metal and noting if a spark jumps the gap. Each wire may be tested in a similar manner.

Testing with Dry Cells.

When the car is equipped with a set of dry cells, the locating of ignition troubles is somewhat easier because there is a constant supply of current with the motor inoperative. Each plug may be examined by turning the motor until a contact is made at the timer for the cylinder in question and with the plugs out and laid on the cylinders, the condition of the spark may be ascertained easily. Care should be exercised to see that only the shell of the plug comes in contact with the metal and not the terminal or exposed portion of the wire.

A simple way of making the contact at the timer is to utilize a screw driver as depicted at Fig. 1 C. This makes a connection similar to that by the roller and contact members. If the coil buzzes with the motor idle, turn starting handle slightly to break contact at timer. The coil may also be tuned by connecting a wire to any metal of the car and placing the other end on the primary connection of the coil and adjusting the screw.

Adjusting Coil.

The coil is adjusted by turning down or up the screw member and when the cylinder does not fire evenly and strongly the screw should be turned down slightly until the explosion is snappy. The contact should be light—just enough to bring about the desired explosion at slow speeds for the voltage of the magneto increases with the speed of the car. The coil should always be adjusted at low speeds. Too severe contact will result in burning the platinum and when this condition exists considerably more current is utilized as the burnt metal sets up resistance.

It is poor policy to use a file to clean these points which require attention from time to time. It is not essential to remove the screw or vibrator for this work and at Fig. 1 is shown a simple method of cleaning and truing the points by the use of the finest emery paper. A narrow strip is utilized and placed between the point adjusted so that they just grip the paper. The latter is then grasped at A A and moved back and forth, taking care to keep the paper in a horizontal position. The paper is then reversed and the lower point treated, after which the unit is adjusted. This saves removing the parts, a task the novice should not attempt.

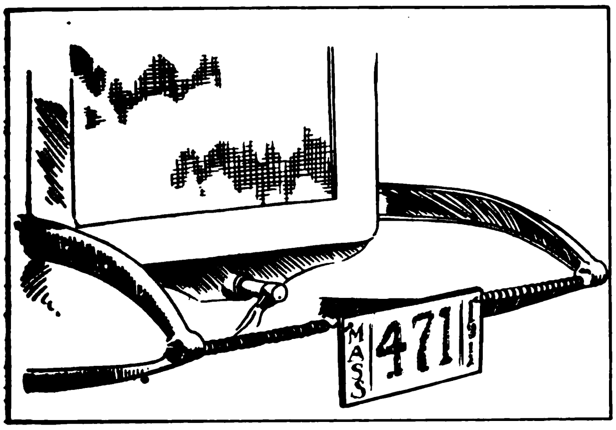

Fig. 3—How License Plate May Be Suspended by Coiled Springs.

Wiring Troubles.

The wiring system of the car is very simple and should the wires become broken or removed, they may be replaced easily by following the wiring diagram outlined at Fig. 2. Should it become necessary to rewire the timer the operation will be simplified by noting that the roller and block of the No. 1 terminal are in contact as shown in the drawing. The replacing of the remaining leads will be an easy matter.

If the timer be removed, and the motor cranked by accident so as to change the position of the rotating camshaft, the ignition will have to be retimed. Several ways are suggested but a simple method is to bring the No. 1 cylinder up on the compression stroke, remove plug and insert finger, noting if the piston is at the top of the stroke, or dead centre. The timer is then replaced with contact being made by the No. 1 block of the timer with the roller. This is the member at the left of the portion to which the lead rod connection is attached. The No. 2 is the next to the left and so on.

The correctness of the leads may be ascertained readily by testing with a screw driver if batteries are installed in the car. From time to time the commutator should be washed out with gasoline or kerosene and refilled with a fresh lubricant. If by accident any one of the primary wires to the member should become broken within the carrying cable, it can be located by the same test as conducted with the screw driver. By keeping the contact points of the coil clean and adjusted properly the car will run smoothly and sweetly, developing its maximum efficiency provided the other components of the power plant are performing their proper function.

CLEANING GLASS OIL GAUGES.

Many oiling systems of the motor car include a tube-like gauge of glass which is utilized to denote the amount of lubricant being fed by the system or the quantity in the container. Where these members are exposed they accumulate dust and dirt, making it difficult to note at a glance whether the oil be dropping or the amount registering.

Many owners of the model T Ford fit a gauge to the crankcase and as it is exposed, it collects dirt. While the centre may be cleaned easily the lower portion is more difficult. At Fig. 4 A is presented a suggestion for removing foreign elements when a cloth fails. It consists of taking a coarse, soft string and making a couple of turns around the glass, drawing one end of the twine and then the other, imparting a sawing motion as outlined in the sketch. If the string be soaked in gasoline, the incrusted deposits will be removed easily.

Where sight feeds are fitted to the dash such as shown at B, it is impossible to get back of these members with a cloth when cleaning. The string kink may be utilized, employing a piece of fine wire attached to one end of the twine to enable the material to be passed around the tube.

MARKING STEELS FOR STOCK ROOM.

System in the stock room is a valuable asset to the repairman. Various grades of steel are required and it is a good idea to adopt a method of marking each separate brand so that the workmen will be able to recognize them without the fire and water test. The best way to insure against difficulty arising from mistakes in using the wrong brand of steel is to have each brand or grade striped with a different color paint. An index board bearing the colors of the steel, can be made and hung on the rack containing the steel. In this manner the brand of steel desired can be found in a moment with the certainty that it will be right.

SUSPENSION OF LICENSE PLATES.

In most states the law requires the display of two license tags, one at the front and the other at the rear. Some motorists object to drilling the metal body or fender for fastening the rear number and although devices are made for securing the tag to the tail light bracket these involve expense. A simple and inexpensive method of suspending number plates is depicted at Fig. 3 and as will be noted, consists of two spiral springs one end of which is hooked into the number tag and the other extremity secured to the spring bolts. The springs should be substantial and considerably shorter than the distance between the frame so that the plate will be held securely and prevented from swinging.

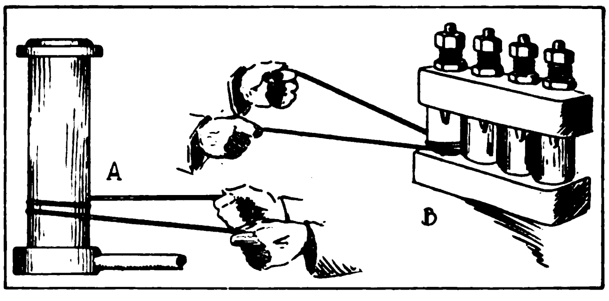

Fig. 4—Method of Cleaning Glass Oil Gauge Tubes with String.

MAKES COLE A SUCCESS.

The remarkable success of the Cole Motor Car Company, Indianapolis, Ind., makes it interesting to consider for a moment the personality of the man behind the institution. President J. J. Cole, whose photograph is presented herewith, has been identified with the manufacture of Cole cars since the inception of the company. Heretofore, he has delegated the selling end of the business to others, devoting his entire time and attention to the production of cars, and as a result the various Cole models have represented the best that J. J. Cole was able to put into them.

J. J. Cole, President Cole Motor Car Company.

He is a modest man, little given to discussing the part he has played in the development of a successful business. The secret of his plan appears to have been the concentration of effort. During the period necessary for building up a business of this magnitude, it was his idea that a separation of the manufacturing and selling ends would result in permitting each employee to give better attention and more time to his individual duties. The wisdom of this suggestion is found in the splendid foundation of the Cole selling organization, backed by a coterie of Cole distributors and agents, which is hard to equal.

Under the new arrangement, which will go into effect July 1, the Cole Motor Car Company is to take over the sales branch, heretofore conducted under the name of the Henderson Motor Sales Company, but it will retain its individuality as before. President Cole will continue to devote his time and attention to manufacture, while the sales end will be in charge of Charles P. Henderson, as sales manager.

PEERLESS COMPANY EXPANDS.

Because of the recent growth of the company's business the Peerless Motor Car Company, Cleveland, O., maker of Peerless pleasure and commercial lines, recently offered for sale to its stockholders only, $300,000 of additional capital stock, which was largely over-subscribed. It also has sold its six per cent. bonds in the amount of $1,100,000, these maturing in installments covering a period of 12 years.

It is understood that the sale of bonds was for the purpose of providing funds for developing and extending the business, particularly to meet the requirements of the commercial vehicle department. The additional capital stock provided money with which to take up the company's floating indebtedness.

FIRST OKLAHOMA FACTORY.

The first automobile factory in the State of Oklahoma is to be built in Oklahoma City by W. E. Nation, who hopes to be producing pleasure and commercial cars within the next three months. A company will be organized with capital of $50,000, and the proposed plant is to have floor space of 12,000 square feet.

Mr. Nation is proprietor of one of the largest retail harness and vehicle companies between Kansas City and the Gulf of Mexico, besides being a member of the Oklahoma City Chamber of Commerce and vice president of the Retail Dealers' Association. For a number of years he and his sons have been spending their summer vacations visiting some of the largest automobile concerns in the country and studying manufacturing methods.

Little is known concerning the new product, but it is understood that it will embody a number of distinctive features, which have been the subject of recent patents granted to Mr. Nation. These are expected to work for economy of maintenance and upkeep, and to prove of decided interest to those who desire a machine adapted for use on the sandy areas of the Far West.

TO SELL OVERLANDS ABROAD.

Claude A. George has been selected by President John N. Willys of the Willys-Overland Company, Toledo, O., to represent the maker of Overland cars abroad in the establishment of an European depot at Hamburg, Germany. The choice is one which will meet with favor by a large number of people both in and out of the industry, who are well acquainted with Mr. George and his particular fitness for the commission.

Claude A. George, Foreign Manager, Willys-Overland Company.

His connection with the industry has been such as to command widespread attention, having been assistant sales manager of the Willys-Overland Company for several years. Previous to his connection with that concern he was an European representative of the Eastman Kodak Company, so that his field in this new work is by no means unknown by him.

The foreign business of the Overland has grown so fast during the last year that this move was regarded as absolutely essential. Several agencies are maintained all over the Continent, as well as on the British Isles, and the Overland product has come to be recognized as particularly adapted for the foreign market. The future success of the enterprise will depend largely upon Mr. George, and his many friends will agree with President Willys in believing that he will meet the opportunity.

WITH OLDSMOBILE IN BOSTON.

Among the factory branch managers in Boston there is none better known than William B. Fewell, who is in charge of the New England division of the business of the Olds Motor Works, located at Massachusetts avenue and Newbury street. Mr. Fewell has been identified with the motor vehicle industry for years and is regarded as one of the "old timers" so far as length of service is concerned. He is a native of Springfield, Mass., and gained his motor knowledge with the Locomobile Company of America, being connected with that concern for a number of years. He then went to the Olds Motor Works and was located in St. Louis Mo., as manager of the branch of the company, being transferred to Boston to succeed George Houck. With the Locomobile Company Mr. Fewell was a travelling representative and as such was brought in contact with thousands engaged in the trade and industry, and as a branch manager he has become known to an exceedingly wide circle of friends. The Olds Motor Works branch will later on be housed in a fine service station now building in Commonwealth avenue, to which, when completed, the present service station at Cambridge will be moved.

William B. Fewell, Manager Boston Oldsmobile Branch.

WISCONSIN CENSUS REPORT.

The census figures for Wisconsin show that the industry in that state practically has been developed since 1899. In 1904 there were six establishments, and in 1909 there were 30. The growth of the industry is shown by the following:

	1904		1909	
	No.	Value	No.	Value
Pleasure cars	2378	$1,846,294	5559	$7,050,862
Commercial cars	12	10,400	32	34,700
Totals	2390	$1,856,694	5591	$7,085,562

Other detailed information is included in the following table:

	1904	1909
Number of establishments	6	30
Persons engaged	587	4647
Proprietors	8	18
Salaried employees	59	331
Wage earners	520	4298
Primary horsepower	645	3153
Capital invested	$1,240,000	$8,746,000
Salaries paid	54,000	443,000
Wages paid	300,000	2,733,000
Cost of materials	845,000	5,340,000
Value of products	1,875,000	11,440,000
Value added by manufacture	1,030,000	6,100,000

WANT LENOX FACTORY.

Recently, H. E. Holbrook of Stoughton, Mass., representing several citizens of that town, called upon the officials of the Lenox Motor Car Company, Boston, maker of the Lenox car, for the purpose of laying a proposition before them, looking toward the location of a plant in Stoughton. That the town appears to be in earnest in seeking the company is gleaned from the fact that the offer includes the gift of sufficient land beside the railroad track, and the erection of a brick factory at a cost of $40,000, the company to pay for the factory at the rate of $5000 a year without interest.

The Lenox car first made its appearance in the market during the Boston show of 1911, and since that time has enjoyed an enviable sale throughout New England and the East. Plans have been under way for an enlarged production during 1912. Evidently the people of Stoughton share the optimistic view of the Lenox officials and are anxious to secure this rapidly growing business for their own.

NOW WITH BAKER ELECTRICS.

An important announcement is made in the information that H. A. Worman, formerly advertising manager of the National Carbon Company of Cleveland, O., has become identified in the same capacity with the Baker Motor Vehicle Company of that city, maker of Baker electric pleasure and commercial cars. Mr. Worman is recognized as an authority on advertising and selling, frequent articles from his pen having appeared in magazines devoted to constructive work along these lines.

After leaving college, he associated himself for a period of five years with the National Cash Register Company, Dayton, O., obtaining valuable experience, which has been combined with his own natural aptitude for this field of endeavor. Later he became identified with the Addressograph and International Harvester companies of Chicago.

Since removing to Cleveland, Mr. Worman has been actively interested in the development of classes in sales and advertising methods in connection with the Y. M. C. A. schools. He is regarded as a convincing lecturer and writer upon the subject of his profession and the Baker Motor Vehicle Company is to be congratulated upon securing his services.

H. A. Worman, Advertising Manager, Baker Motor Vehicle Company.

CORRESPONDENCE ON MECHANICAL SUBJECTS.

Fitting Auxiliary Oiler.

(72)—I have a ——— car which gives excellent service but believing in using plenty of oil am writing for advice upon the installation of an auxiliary oiler. The oiling system of the machine is splash and the lubricant is poured in through an opening in the crankcase. After running about 50 miles the gauge does not show enough oil to suit me. I frequently take long trips and have to stop to replenish the oil. Is there not some way I can supply the oil without leaving the seat?

OSCAR L. MERTON.

Canton, O., May 29.

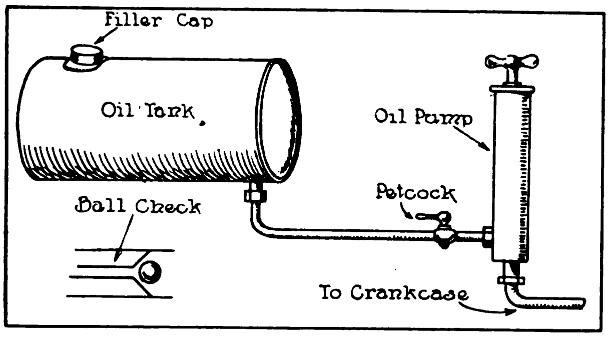

Fig. 1—Auxiliary Oiler for Pumping Lubricant to Crankcase of Motor.

While it is an excellent idea to use enough oil too much results in the car smoking and creating trouble with the spark plugs as well as causing carbon. The writer knows of several machines of the make referred to and their owners have not experienced any trouble as they follow the direction of the maker. A force feed or mechanical oiler may be installed and the Pedersen Lubricator Company, New York City, makes a device adapted for this machine. It pumps the oil in proportion to the speed of the motor, is attached easily and is not expensive.

At Fig. 1 is presented a suggestion for pumping oil as desired to the crankcase. It consists of an oil tank, metal tubing, a petcock and an oil pump. The tank may be mounted inside the dash and should be higher than the pump to obtain a flow of lubricant to the latter by gravity. A pump may be secured having a petcock or the latter inserted in the line as shown in the drawing. To utilize the device, the petcock is opened and the pump handle pulled up, which will take in a charge of oil. The petcock is then closed and the handle depressed which will force the lubricant to the crankcase. As the pump is made in several sizes and stated capacities, the amount of oil pumped to the crankcase could be computed easily.

If it is not convenient to mount the oil reservoir above the pump, the former may be attached to the side of the car and ball checks employed, these being so fitted as to allow oil to be drawn into the pump in the direction as denoted by the arrow in the illustration. When the pump handle is depressed the ball will be forced against its seat preventing the lubricant from returning to the reservoir.

Storage Battery Plates.

(73)—Being a subscriber of your magazine I would like to be informed regarding the Faure type of storage battery plates utilized for electric lighting of the motor car. What I wish to ascertain is whether the active material, oxide of lead, applied in a paste form is the same for both the negative and positive plates, and how these members may be distinguished.

J. WALLER.

Brooklyn, N. Y., May 14.

In the Faure or pasted type the lead plates are coated with minium or litharge made into a paste with acidulated water. When the material is dry these plates are placed in a bath of diluted sulphuric acid and subjected to the action of a current, by which the oxide on the positive plate is converted into peroxide, and that on the negative reduced to finely divided or porous lead. The positive plate may be distinguished easily by its color, being a brown or a chocolate. The negative is a light gray. Ignition batteries are not practical for electric lighting because of their low discharge rate. A lighting battery, however, may be utilized for ignition purposes.

Slipping Clutch.

(74)—I have a model 38 Overland which I have operated less than 3000 miles. I cannot tighten the high speed clutch any more. It continually slips, and the pedal won't stay in high. It is the planetary type transmission. Could you inform me how to remedy it? Would it take an expert to replace a part that might be causing the trouble?

GEORGE S. MARSHALL.

Basehor, Kan., May 12.

The slipping of the clutch is due to operating with the member improperly adjusted and the wear to a lack of lubricant. The best method would be to disassemble the transmission and examine each part carefully. A new plate probably will be required, but this may be determined by inspection. Unless one is familiar with the work it is best to have the repair attended to by a capable repairman. If there is an Overland agent convenient he will be able to locate the trouble and give an estimate as to the cost of the repair.

Acetylene Mixture.

(75)—I understand from the correspondence column of your most valuable Journal that acetylene absorbed by gasoline gives a more powerful explosive mixture than gasoline alone. I would consider it a very great favor if you will inform me of a simple method of obtaining this mixture.

LOUIS ENGEL, JR.

Philadelphia, Penn., May 18.

Regarding the mixing of acetylene and gasoline the article dealt with probable dangers of the two products uniting or mixing with air in a closed room, or a garage, and being ignited by a flame. A certain authority holds that such a mixture would produce a more powerful explosion than a gasoline vapor.

As far as the writer can ascertain a mixture of acetylene and gasoline is not utilized although it was stated in the article that the former could be carbureted; that is, mixed with air in a special device and transferred to the combustion chamber in the usual manner. In some self-starting devices it is claimed that the engine may be operated by the equipment until the supply from the tank becomes exhausted.

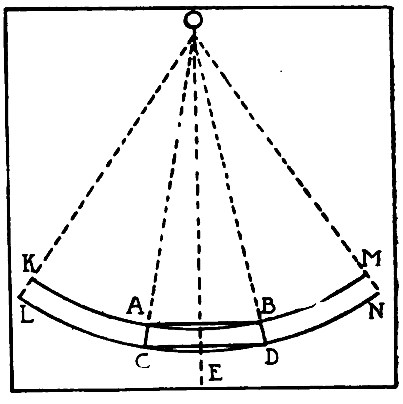

Fig. 2—Working Diagram for Cutting Lining for Cone Clutch.

The proper acetylene mixture is 10 parts of air and one of the gas. This is brought about by a mixing valve incorporated between the tank and cylinders. There are several upon the market which perform this function automatically. While by experimentation one of these members could be made it would be better to purchase one, as considerable time and expense would be saved in the installation.

Relining Cone Clutch.

(76)—As a new subscriber to your valuable publication, would ask if you will kindly assist me by giving any information you may possess concerning the following: I purchased a second hand machine and am having trouble with the cone clutch. The repairman informs me that it requires a new lining because the old one is worn out. Would like to do this work to save expense of repair bills. NEW OWNER.

Portland, Me., May 17.

The simplest way of releathering the clutch is to remove the old member and utilize it as a pattern. When this is not possible the following method may be employed: Take a large sheet of paper and draw a side elevation of the clutch cone as outlined at Fig. 2, A, B, C, D. Produce the lines A—C and B—D, until they meet at the point O. Next draw the centre line O—E. With the centre O and radius O—C, describe an arc L—N, and with radius O—A, describe another arc K—M.

Next, measure the largest circumference of the cone. For example: Suppose the circumference of the cone to be 60 inches. On a pair of dividers take a distance a small fraction of this, say one inch. From the point E where O—E cuts the larger arc, lay off round the arc this dimension 30 times in the same direction. This will give the point L. With the centre E and radius E—L mark off the point N. Join L and N to centre O. Then K, L, M, N will be a figure the same shape and dimensions as to be cut. Cut out of the paper the figure K, L, M, N, and use as a pattern from which to cut the leather. This pattern can then be marked and utilized when necessary in the future.

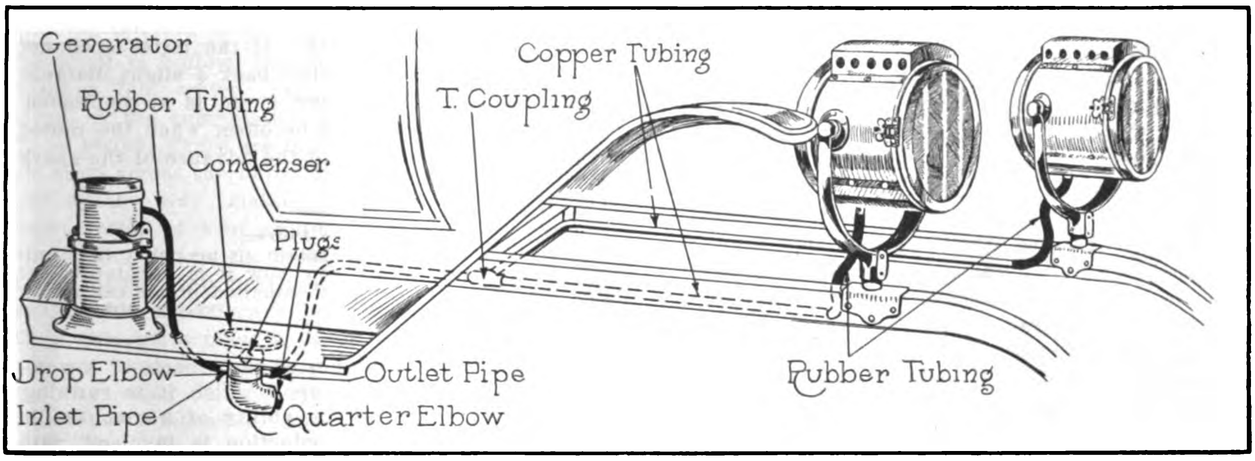

Fig. 3—Inexpensive Device for Catching Moisture in Piping of Acetylene Lighting System Utilizing a Generator.

The clutch leather should be left about .25 inch short and the two ends riveted to the cone first so that they butt against each other. The leather is then soaked with hot water and stretched onto the cone, in much the same manner as a pneumatic tire is fitted to a rim. As the leather dries it will shrink tightly into its place. It is then secured by copper rivets, care being taken to see that the heads are well below the surface of the leather. The cone is next mounted on a lathe and the material trued up. In fitting the leather it is best to mount it with the shiny side of the material next to the cone.

After the clutch has been replaced it should be soaked liberally in oil and during the first 50 or 100 miles be well lubricated. It is essential that the leather be kept soft and pliable as when it becomes hard it is apt to burn or char when slipping.

Vibrator Inoperative.

(77)—What is the cause of failure to start from the switch of a Bosch type of dash coil such as employed on the Marion car? I can start on the batteries by cranking, but when I push down the button on top of coil there is no buzz and the motor won't start. A set of batteries lasts but a short time. Was informed by a repairman that the coil was short circuited and was advised to ship it to the Bosch company for repairs. A READER.

Providence, R. I., May 11.

It is evident that a short circuit exists. The best plan would be to remove the coil, an operation accomplished by unscrewing the cap, which will permit the withdrawal of the coil proper, and send it to the maker. The Bosch Magneto Company maintains a service station at Boston near the Motor Mart. Perhaps it would be advisable to drive the car to Boston and have the ignition system inspected thoroughly.

Water in Acetylene Pipes.

(78)—Am driving a model T Ford and operate a good deal at night. The gas lamps give me considerable trouble, and although I blow out the pipes and clean the burners, they do not stay clear. Is there any way the trouble can be cured, or will a new generator be necessary? FORD.

Topeka, Kan., May 12.

To ascertain if the fault be that of the generator, examine the deposit in the bottom of the vessel and if it be dry it denotes that the device is operating properly. If the material be wet or soggy, and the lights continue to burn for some time after the generator is shut off, it shows that the latter is not working properly and that the water is not feeding as it should to the carbide.

In the case referred to the trouble is more apt to be due to the presence of moisture in the tubing because of condensation. This usually occurs in the first 12 inches or so after the gas leaves the generator and consequently the pipe and rubber connections should slope directly downward to the lowest point in the system and continue a foot or more in order to drain any possible moisture toward the generator instead of in the direction of the lamps.

At Fig. 3 is a sketch which illustrates a method of incorporating a water trap for retaining any moisture that may be present in the system. It is constructed easily and is inexpensive as the material required may be procured readily from almost any plumber.

It consists of a drop elbow with a male thread, quarter-elbow and two plugs. The drop member has a flat flange perforated for screws and is attached under the running board as shown in the drawing. The quarter-elbow is screwed to this and plugs utilized to close the openings. The former is tapped and threaded to take a connector and a .25-inch copper tubing to which is attached the pipes leading from the generator to the trap, and thence to the lamps. All moisture will collect in the trap and can be removed easily by unscrewing the lower plug. A petcock may be installed if desired, in place of the plug member. As the trap will hold considerable water, and will require emptying occasionally, the device will answer all purposes as well as being cheaper than ready made water traps. The method of installation is also suggested in the diagram.

Stress and Strain.

(79)—Am a reader of your magazine and notice the reference to torsional and tensional strains and stresses, and that a certain part is made to take care of these. Will you kindly explain what is meant by the terms?
INFORMATION.
Cisco, Tex., May 19.

There is some difference of opinion among writers as to the definition of these terms. An external force applied to a body, so as to pull it apart, is resisted by an internal force, or resistance, and the action of these forces causes a displacement of the molecules, or deformation. Some writers call this a stress, and the internal force a strain. Others hold a reverse opinion. Some authorities never use the word "strain" in their writings to avoid confusion.

Merriman states: "A stress is a force which acts in the interior of a body, and resists the external forces which tend to change its shape. A deformation is the amount of change of shape of a body caused by the stress. The word 'strain' is often used as synonymous with stress and sometimes it is also used to denote deformation."

Stresses are of different kinds such as tensile, compressive, transverse, torsional and shearing. A tensile stress or pull, is a force tending to elongate a piece. A compressive stress or push is a force tending to shorten it. A transverse stress tends to bend it. A torsional stress tends to twist it. A shearing stress tends to force one part of it to slide over the adjacent part. Tensile, compressive and shearing are called simple stresses. Transverse stress is compounded of tensile and compressive stresses, and torsional of tensile and shearing. To these five varieties might be added tearing stress, which is either tensile or shearing, but in which the resistance of different portions of the material are brought into play in detail, or one after the other, instead of simultaneously, as in the simple stresses.

Lengthening Valve Stems.

(80)—I read in a motor publication that valve stems which had become worn and were not adjustable could be lengthened by placing on an anvil and hammering. I understand the ends are hardened and if the temper is drawn for drawing won't the metal have to be rehardened?
L. E. MOWRY.
St. Albans, Vt., May 29.

The ends of the stems are hardened and if the temper be drawn will have to be retempered. In drawing a valve stem care should be exercised not to bend it and the drawing should be at a point above the cotter pin hole and not at that portion that enters into the tappet member. While the writer has lengthened these members requiring but a slight increase, it is advisable to have it done by a blacksmith or some one familiar with the work.

Phosphor Bronze.

(81)—What is the difference between phosphor bronze and any other bronze? INQUISITIVE.
Hannibal, Mo., May 18.

Bronze is an alloy of copper and tin with small proportions of other elements. In the year 1868, Montefiore & Kunzel of Liege, Belgium, found by adding small proportions of phosphorus or "phosphoret of tin or copper" to copper that the oxides of that metal, nearly always present as an impurity in more or less quantity, were deoxidized and the copper much improved in strength and ductility, the grain of the fracture became much finer, the color brighter, and a greater fluidity was attained. The different bronzes are produced by combining different alloys such as silicon, aluminum, etc.

Timing the Spark.

(82)—I have an 1908 Oldsmobile roadster with a storage battery, coil and timer for ignition. The motor will not throttle down and I have closed the carburetor throttle as much as possible but it does not improve it as I wish. I cannot advance the spark very far without the engine knocking. Sometimes with the spark advanced a trifle I get a kick from the starting handle when cranking slowly. What is the cause? L. L. M.
Deming, N. Mex., May 10.

The ignition timing is too early; that is, the spark takes place before the piston comes to the top of the compression stroke. This accounts for the motor racing. It is easily remedied. Loosen locking nut or binding screw of commutator or timer on shaft and move arm with roller contact block back; that is, in a reverse direction to that in which it rotates when the motor is running. Try about a .25 inch; relock nut and start motor. If the latter does not throttle enough, set the roller back a slight distance and repeat until the desired speed is accomplished. This lateness of spark will be offset when the motor is running by the amount of the advance of the spark lever.

Tractive Power.

(83)—Will you please explain to me what is meant by tractive power or traction, how it is calculated, and what the effect of the gear reduction of an engine is?
OTHIS WHEAT.
Boston, Mass., May 24.

Traction is the adhesion of the wheels of a vehicle to the road or track upon which it is running, while tractive power is the ability of a machine to propel itself. The gear reduction is involved with this, for given a certain power, the greater the gear reduction, the more the tractive effort will be, while with the small reduction little tractive power will be available.

It is for this reason that an automobile has more than one speed. High speed is only used for straightaway stretches, when the car is in motion and has good traction. Little power is then required to propel it, and a small gear reduction will be used resulting in high speeds. Where the conditions are not favorable to speed, as on rough roads, slight hills, etc., a slower speed is needed and more tractive effort is required to propel the car over the obstructions. In the ordinary machine, second gear would be used, this being more of a reduction than high, but less than the other speeds. With still worse grades or road surfaces, even a greater amount of tractive effort is necessary.

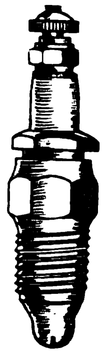
Useful Hints When Working Wood—When driving screws into wood with a screw driver, it is quite an advantage to use soap on the thread of the screw. Draw the screw across the bar of soap before inserting in the wood.

To whiten a surface for laying out work, mix whiting with gasoline to the consistency of paint, and cover the surface to be marked. The gasoline will soon evaporate, leaving a white surface on which lines can be easily scribed.

DESIRABLE ACCESSORIES FOR THE DEALER.

Descriptions of the Newest and Most Popular Lines Which the Up-to-Date Agent May Handle with Profit.

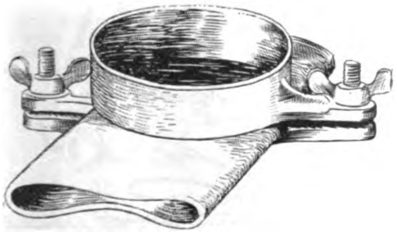
The Vim Spark Plug, manufactured by the K-W Ignition Company of Cleveland, O., well known maker of ignition specialties, differs from the usual members in the manner in which it ignites the mixture in the chamber. The shell is hollow, providing a chamber into which the gas is forced by the compression stroke of the piston. There are four narrow slots across the bullet shaped nose of the plug, making for a concentration of heat around the firing point, and as the mixture is forced through this heat it ignites easily when the spark occurs. When this takes place a flame is shot out through the four slots into the vapor in the cylinder, facilitating combustion. Owing to the passage of the mixture the points are cleaned and it is said that sooting and fouling by oil is impossible. They are made with mica and porcelain cores in .5-inch pipe tap, metric or S. A. E. standard sizes.



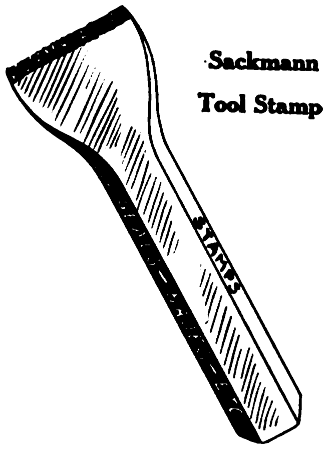
Vim Spark Plug

*

The Adamson Auto-Vulcanizer, made by the Adamson Manufacturing Company, East Palestine, O., is a portable repair kit weighing about three pounds with which it is claimed that a patch may be vulcanized perfectly in 15 minutes on the road or in the garage. The device is operated easily, the work consisting of clamping the tube with its repair gum in the holder and filling the latter with one ounce of gasoline. When the fuel is ignited the instrument automatically completes its work. The principle employed is that the temperature is governed automatically in relation to that of the gasoline during combustion. When the temperature of the fuel attains a certain degree, the volume of gas given off by it forces the zone of combustion above the heat conducting members. This allows the vulcanizer to cool slightly when the flame again lowers, and becomes effective. When the gasoline is first ignited the temperature of the device rises gradually to a certain vaporizing point of the fluid and remains constant. No cement or acid is utilized in the process. The kit comes complete and comprises the vulcanizer, gum, scissors, etc., is very compact and will appeal to motorists who undertake their own repairs as well as those who do considerable touring.



Adamson Vulcanizer



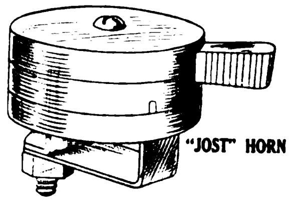
Sackmann Tool Stamp

*

The Sackmann Tool Stamp is the product of the Sackmann Manufacturing Company, Akron, O., and is designed to mark tools with initials or letters, thus preventing mistakes as to ownership. Standard tools, like wrenches, pliers, etc., are hard to identify and are often borrowed and others returned by mistake. Numeral stamps are handy for marking the components when overhauling the power plant, thus facilitating the reassembly of the parts. The device is inexpensive and is made to order, although certain stock stamps are carried.

*

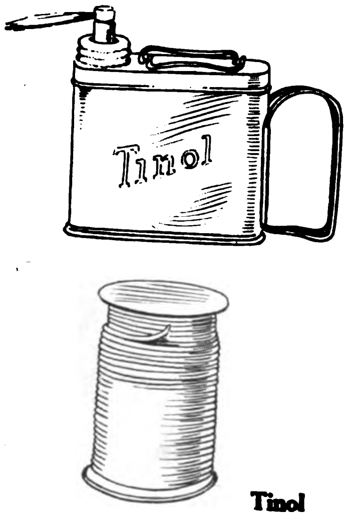
The Jost Horn Switch is manufactured by Frank Morse, Boston, Mass., maker of automobile and motor boat electrical appliances, and is designed for operation of any electric horn or signalling device requiring a switch. It is constructed neatly and well, being of hard rubber and occupies but little space. It is attached easily to the spoke of the steering wheel and may be operated by the thumb without relaxing the grip upon the steering member, a feature that will appeal to motorists. The lever is moved readily when an electrical connection is desired, and when released automatically cuts off the current. It is inexpensive and is accompanied by 10 feet of cord for attaching.



"JOST" HORN SWITCH

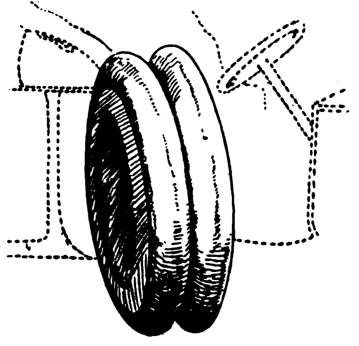
*

Tinol is a new soldering outfit produced by Hess & Son, Philadelphia, and consists of an alcohol torch, soldering copper, can of paste and a spool of solder wire. The latter is tubular and filled with a special Tinol flux and the entire outfit comes in a neat leather case. It is very compact and with it repairs may be made upon the road as it is claimed by the maker that no careful cleaning of the part is necessary, owing



Tinol

to the special flux employed. It is stated that electrical joints may be soldered by wrapping the part with a piece of waste wet with gasoline and burning off the fluid, after the damaged place has been coated with Tinol paste. The latter is also employed for mending piping leaks, and it is held that an amateur may repair leaky radiators successfully. The outfit is not expensive and should prove a valuable acquisition to the tool kit of the motor car as well as the private garage.



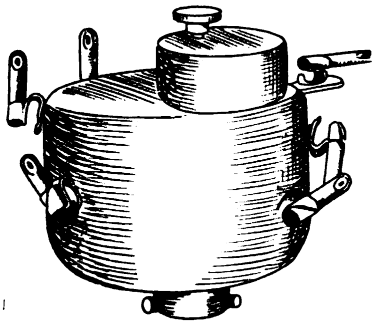
Amphi Tire Trunks

★

Amphi Tire Trunks, made by the Coward Auto Supply Company, Motor Mart, Boston, are adapted to take the place of a door, so that installing them at the side, on the running board, does not mean the obstruction of one of the doors as is usually the case. The trunks are supplied with a swivel mounting and can be fitted at either the side or the rear. They are water and dust proof, do not rattle, and are suitable for any kind of tire or demountable rim.

★

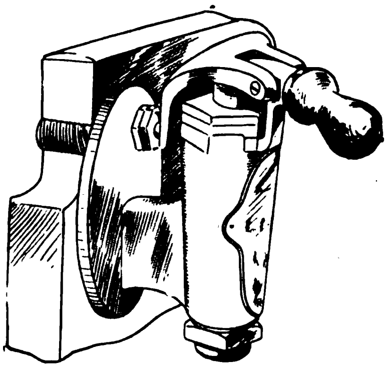
The Monitor Distributor is made by the Motor Specialties Company, Waltham, Mass., and is designed for use with a single unit coil, furnishing sparks to any number of cylinders. The distributor in combination with a six-volt battery, may be used instead of a high-tension magneto for ignition purposes at about one-tenth of the cost of installation. It is especially recommended for use on motors which run at high speeds. A feature of the construction is the shaft, which is of solid steel and runs through a very long phosphor steel bearing of perfect finish. This construction eliminates the fault of rocking or wabbling and secures a true and smooth running machine of long life. All the primary parts are at the top of the instrument where they are accessible by removing the cover. The contact is of a slightly wiping character, enough to keep the surfaces clean, and by means of a screw the duration of contact may be adjusted to suit the motor or coil. The body of the instrument is strong and impervious to water and oil.



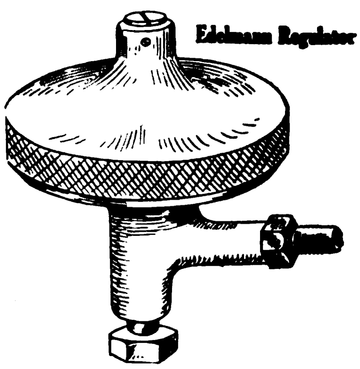
Monitor Distributor

★

The Flash Auto-Lighter is a system for automatically lighting or extinguishing acetylene headlights from the driver's seat, made by the Motor Specialties Company, Motor Mart, Boston. It comprises three parts, the controller, which is illustrated, an induction coil, and a pair of special burners. The controller combines a gas valve and an electric switch, the two being operated by the one lever. It is so timed that sparks are produced at the burners before the opening of the gas valve. The turn of the lever starts the sparking at the burners and admits the gas to the piping. The coil is of the ordinary single unit type, of high grade, finished in mahogany and brass and thoroughly guaranteed. In order that the lighter may be entirely independent of the engine circuit, the coil is provided with four terminals for the primary and secondary wires. The burners are made to fit any standard lamp and are provided with sparking points rigidly clamped in position over the gas vents. The points will not interfere with the light given by the burners, and will not be jarred apart by the vibration of the car. The lamps are lighted instantaneously, by a single turn of the handle to the left, and may be extinguished as easily, by a turn of the handle to the right. The lighter enables the lamps to be controlled as easily as the motor, so that they may be extinguished when stopping or driving on city streets, with resulting economy. With the outfit are furnished gas pipes, union fittings, wires, terminals, etc.



Flash Auto-Lighter



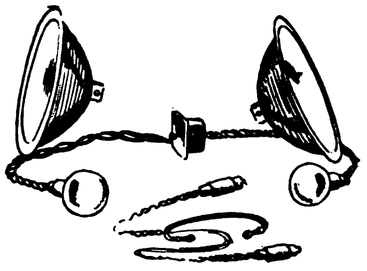
Edelmann Regulator

★

The Edelmann Regulator is manufactured by E. Edelmann & Co., Chicago, Ill., and is designed to be attached to pressure gas tanks, enabling the user to regulate the pressure of the gas delivered from the tank. It can be adjusted to deliver at pressures of from as low as two ounces, which is about the proper figure for supplying two .75-foot burners, to a pound or more, as desired. The regulator is made with a metal diaphragm which has long life. Adjustment is easily made by turning the screw in the cover.

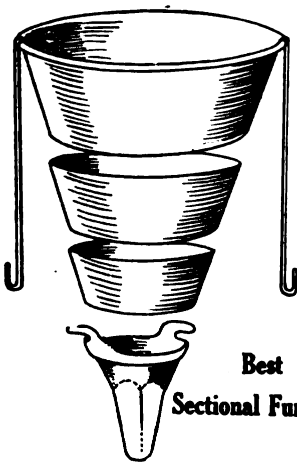
★

The L. C. R. Lighting System is made by the L. C. R. Storage Battery Company, Dayton, O., and is designed especially for Ford cars. It consists of a set of parabolic reflectors to fit in the ordinary gas lamps, with wiring to connect the lamps with the magneto. The installation is an exceedingly simple one, not requiring an expert. It adds little to the weight of the car, as no storage battery is car-



L-C-R Lighting System

ried, current being taken from the magneto alone without danger of weakening the ignition, it is claimed. A switch installed on the dash or wherever convenient, controls the lamps. The reflectors are parabolic, silver plated, with a flange which will fit beneath the wire ring that holds the glass in the lamp, so that it is easy to install them. The globes are of Mazda make with Edi-Swan base. The outfit comes complete with all connections, terminals and wire, ready to be installed.



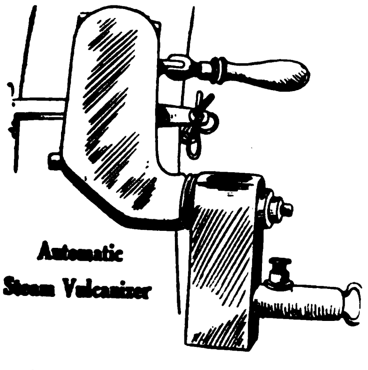
Best Sectional Funnel

* * *

The Best Sectional Funnel is built upon the collapsible plan, being in four sections which when nested fit in a circular box 7.75 by 2.5 inches, enabling the funnel to be carried in the tool box without waste of space. It is made by R. L. Best, Bismarck, N. D., of 26 gauge steel, nickel plated, and is inexpensive. The two arms seen hanging from the rim of the funnel engage with hooks on the spout when the funnel is in use, making it rigid. The arms fold underneath when the sections are nested.

* * *

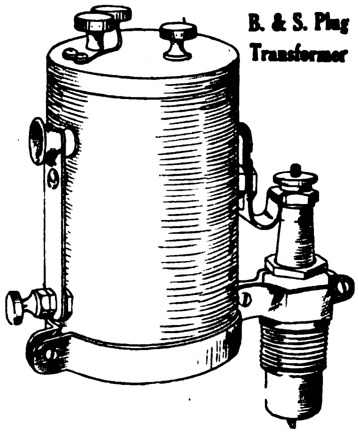
The Automatic Steam Vulcanizer is being placed on the market by the Simplicity Supply Company, Cleveland, O., and has been designed with the idea of producing an apparatus as nearly automatic as possible, requiring no attention in vulcanizing. The device has no gauge or thermometer. To use it is only necessary to light the lamp, no watching or other attention being required. It will do all kinds of work, either on the wheel or off, from vulcanizing cuts and tears in the casing to patches on tubes. The outfit is small and compact, taking up little room in the tool box. The cover of the box forms a vulcanizing board which may be clamped to the running board of a car, or wherever convenient.



Automatic Steam Vulcanizer

* * *

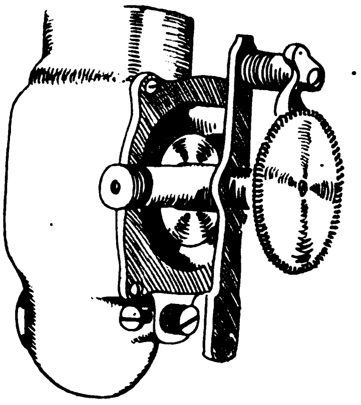
The B. & S. Plug Transformer is made by the Briggs & Stratton Company, Milwaukee, Wis., and is a complete vibrating spark coil mounted on the spark plug without any secondary wiring to leak. It fits any spark plug and gives a hot spark with low battery consumption. The cost of a switch and coil is saved and the device is said to give better results than a box coil, the vibrator being very rapid and causing a shower of hot sparks at the plug point. Installation is easy, there being only one primary wire necessary, thus preventing mistakes in wiring. The vibrator may be adjusted readily, and at the same time the whole instrument is water, heat and oil proof. It may be covered with a protection hood if desired. Four types are furnished, two for mounting on the plug as illustrated, and two for mounting on the cylinder where convenient. The latter require a short piece of secondary wire from the coil to the plug.



B. & S. Plug Transformer

* * *

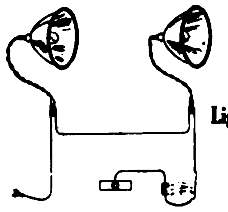
The Atkins Carburetor is made by the Atkins Manufacturing Company, Coldwater, Mich., and differs from other carburetors in that the float chamber may be located anywhere along the gasoline line as it does not stop the flow of fuel through the nozzle when the motor stops, but merely regulates the hydrostatic pressure on the nozzle. The float is thus not an integral part of the carburetor and is not shown in the illustration, which portrays only the carburetor proper, which may be placed in any position without affecting its operation. The instrument is very compact and is simple in action. The gasoline flows from the float chamber so placed as to furnish a gravity feed to the carburetor, and the throttle regulates this flow by increasing or diminishing the space around the nozzle. The throttle is connected to the lever seen between the toothed wheel and the body of the carburetor. Moving this lever moves the toothed wheel and the valve. The only adjustments are in the connection between the lever and the wheel, and the auxiliary air valve.



Atkins Carburetor

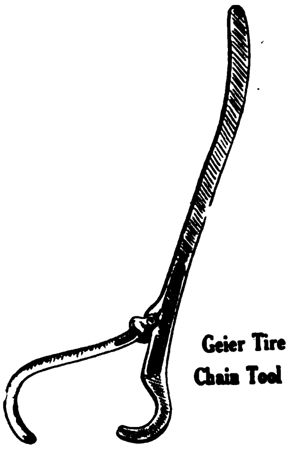
* * *

The H. & H. Lighting Outfit, made by the E. A. Hammer Company, Cleveland, O., has been specially designed for use with Ford cars, so that the owner of one of these machines can have electric headlights, at slight expense. Current is taken from the magneto, the wiring being from magneto to lamp and from lamp to ground, the two lamps being wired in series. The outfit consists of a pair of parabolic reflectors, two tungsten bulbs, switch and wires with terminals and clamps. The reflectors are of the parabolic type, projecting the maximum amount of light from the lamps, and the



H. & H. Lighting Outfit

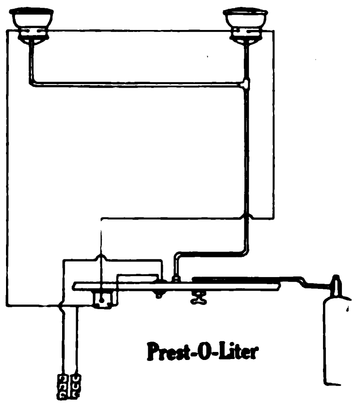
sliding socket enables the latter to be placed in the proper focus of the parabola. The bulbs are fitted with the Edi-Swan or bayonet lock base, which does not jar loose or break, preventing the lamp from becoming disconnected or injuring the reflector. The filament of the lamps is tungsten, tough enough to withstand the strain of automobile work and giving a brilliant light which will show the road ahead for 600 feet at 25 miles an hour.



Geier Tire Chain Tool

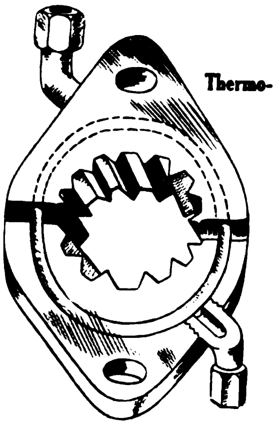
The Geier Tire Chain Tool is sold by the Post & Lester Company, Hartford, Conn., and is used for tightening anti-skid chains. Those who have had trouble in applying these members on a wet day will appreciate this device, which makes it easy to bring together the ends of a chain for hooking. The tool is in two parts, both hooked to engage the tire chain. Depressing the handle brings the hooks on it and the movable arm together and in line, enabling the chain to be fastened.

The Prest-O-Liter, made by the Prest-O-Lite Company, Indianapolis, Ind., makes possible the lighting, control and extinguishing of the acetylene running lights of an automobile from the driver's seat. It is made in three styles, for two headlights, two headlights and tail light and for two headlights, tail light and two side lights. The system consists of an automatic reduction valve attached to the gas tank, piping to the dash, controller valve for the dash, insulated burners with spark gap, spark coil and wiring. It is independent of ignition system, using separate battery and spark coil. The regulator valve, attached to the gas tank, keeps the pressure in the pipe line to the dash down to less than two ounces, so that there is no danger of an explosion as might be the case if the gas were under heavy pressure. To operate, it is only necessary to open the controller on the dash and push the button. This permits acetylene to reach the burners and produces a spark, igniting the gas. The handle of the controller is detachable, and the latter governs the gas so that any desired set of lamps may be lighted.



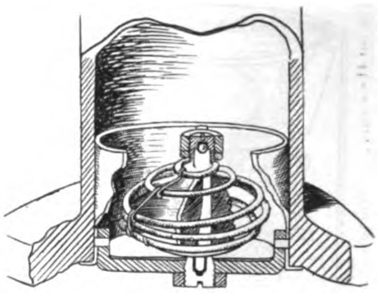
Prest-O-Liter

The Thermo-Gasket is a combined heating and mixing device made by F. W. Battershall & Co., Albany, N. Y. Less than .5 inch thick, it is designed to be bolted between the carburetor and the intake manifold of the motor, taking the place of a hot water jacket on the carburetor and of a mixer. The construction is easily seen in the illustration. Surrounding the opening through which the mixture passes is an annular passage through which flows a continual stream of hot gas, led from the exhaust manifold of the engine through copper tubing. By this means the device is heated and the carburetor and intake manifold as well, the mixture as a result being made homogeneous, with all particles of gasoline thoroughly vaporized by the heat. An additional feature of the device which assists in mixing is in the diagonal fins which not only radiate the heat into the mixture, but impart a whirling motion to it.



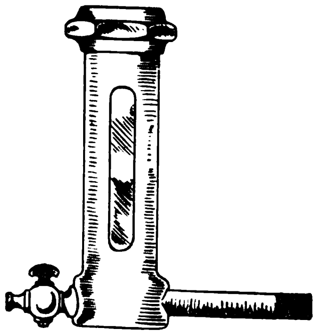
Thermo-Gasket

The Stanley Mixer is being placed upon the market by C. W. Jacob & Allison, New York City, and is a device to be located in the intake pipe above the carburetor. The construction is such that the incoming mixture rotates the coil and is itself set whirling, resulting in the gasoline and air being perfectly mixed before it enters the motor. All globules of gasoline are broken up and vaporized by passing through the mixer, resulting in increased power and fuel economy as well. The rotating member is made of stiff wire formed into a coil, within which is a pair of tilted propeller blades which whirl the device. The coil, or agitator as the maker calls it, is mounted on ball bearings and is very easily turned, offering little or no resistance to the passage of the gases.



Stanley Mixer

The H. & H. Oil Gauge has been designed specially for use on Ford cars by the E. A. Hammer Company, Cleveland, O. It is attached to the bottom of the crankcase, and shows the amount of oil therein at all times. No drilling of the case is necessary to install the gauge stem first being inserted in place of the petcock with which the case is provided, and the petcock being located in the gauge itself. The gauge has been improved over the previous model produced by the company in that means have been provided for draining without removing it. It is turned from a solid brass bar, making it very substantial.



H. & H. Oil Gauge

UP-TO-DATE Machine & Tool Equipment

CRITCHLEY EXPANDING REAMER.

Reamers are exceedingly useful tools in the repair shop as they are used frequently to enlarge holes to size. A complete equipment of these members in order to take care of different work means a large investment. The Critchley patent expanding reamer, manufactured and marketed by Chadwick & Trefethen, Portsmouth, N. H., is designed to do the work of several instruments, inasmuch as the cutters are adjustable, permitting the reaming of odd sized holes, a feature which will be appreciated by the average workman.

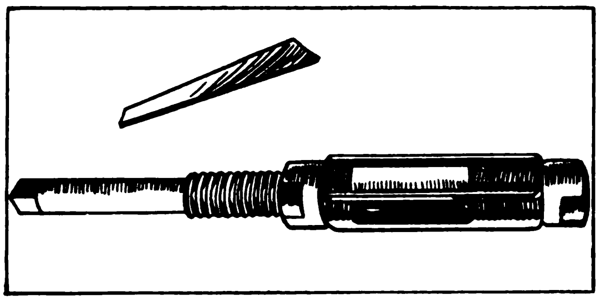


Fig. 1—Critchley Expanding Reamer Fitted with Adjustable Cutter Blades, Permitting Reaming of Odd Sized Holes.

The device is shown at Fig. 1 and it will be noted that a screw thread is cut on the body of the tool on either side of a space. The latter is left uncut to insure stability. Five grooves or slots are made on the shank to take the cutters which are beveled at each end and held securely by nuts. When in normal position a certain standard size is obtained. An enlargement is secured by loosening the retaining nuts and moving the cutters in the grooves, increasing the diameter of the cut.

Very fine measurements may be secured easily. The graduations vary by sixteenths, beginning at .46875 inch diameter, although in larger size the reamers vary from .125 to .25 inch. The reamers are not expensive and extra cutters may be secured for a small sum. The device is constructed from a high grade material and all parts are strictly interchangeable.

PORTABLE ELECTRIC GRINDER.

Grinding machines are important factors in the equipment of the machine shop, and not only are they economical in the manufacture of machinery and tools, but they produce the same degree of accuracy and excellence when used either on hardened or soft work. While there are many forms of grinders, those of the portable type and designed for attachment to the lathe, shaper or miller are very efficient.

The design depicted at Fig 2 is the product of the Hamilton-Beach Manufacturing Company, Racine, Wis. It is an exceedingly handy tool for grinding dies, reamers, cutters, etc., and operates equally well on external or internal work. It is claimed by the maker that a .25-inch hole four inches deep may be ground easily and accurately as the device is sturdily constructed and free from vibration. Any kind of wheel may be utilized and felt or oil stones may be employed when a very fine finish is desired.

The grinder is operated by electricity and a direct or alternating current may be employed. The motor is 1-12 horsepower and drives the grinding wheel at 10,000 revolutions a minute. It is air-cooled and proof against heating from overload. The device is very light, weighing as it does, five pounds. The outer casings are constructed of aluminum, highly polished and the dust proof bearings are made of a high speed nickel babbitt. The armature is ground on centres to a mirror finish, assuring extreme accuracy. Adjustable end thrust and main bearings take up all possible wear.

The grinder comes complete with 10 feet of special cord and attachment plug permitting connection to any electric light socket. It is stated by the maker that it may be operated economically, consuming but little current and that hardened tools may be ground accurately. Cutters may be ground without removing them from the milling machine.

SACHS MAGNALAMP.

One of the difficulties experienced by machinists is arranging the lighting equipment so that the work is properly illuminated. Before the electric lamp came into general use gas was utilized, and by means of pivotal joints the flame was brought into the desired position, an operation requiring considerable time.

Even with the ordinary electric lamp there is trouble in locating it so that good results will be obtained. Tie cords, hinged brackets, pedestals, rods, etc., are employed but these have the disadvantage of requiring time for adjustment. A device which eliminates all these troubles, as well as meets with the demand for a light just where and when needed, is the Sachs Magnalamp, which was recently brought

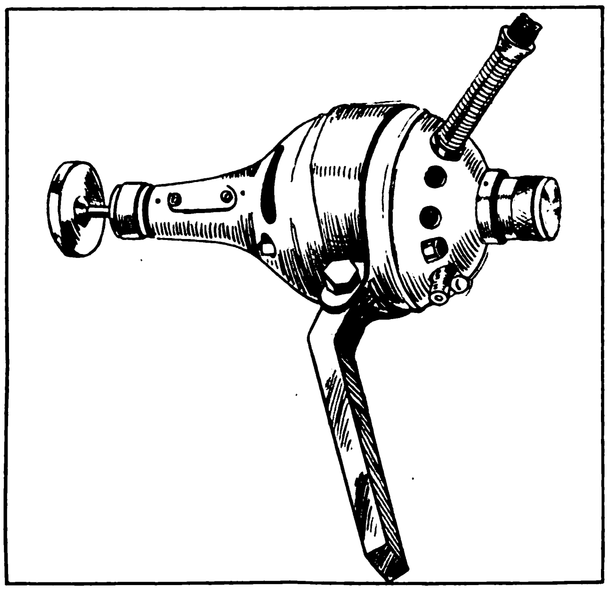

Fig. 2—Hamilton-Beach Portable Electric Grinder, Adaptable to Internal and External Work.

out by the Sachs Laboratories, Inc., Hartford, Conn.,

It is a portable device and similar to the ordinary electric lamp with the exception that it is equipped with a magnetic extension as will be noted by reference to Fig. 3. This projection carries a highly efficient electro-magnet which is combined with the lamp and connection socket, and a switch in a cylindrical structure. It is very compact, being three inches high and 2.5 in diameter. The bulb is protected by an electrically welded guard. The lamp extends either longitudinally from the top end of the cylinder or radially from the side, and its position may be changed easily and quickly. A connecting plug attached to a flexible cable, may be fitted in either receptacle of the device, and the other end of the cord carries a socket member for attachment to the usual lighting circuit.

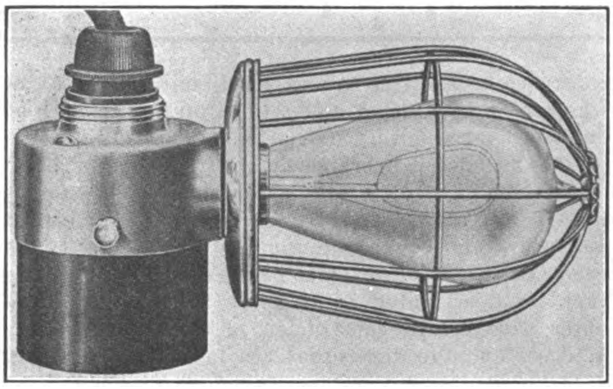

Fig. 3—Magnalamp, an Electrical Device Self-Adhering to Metal by Means of Self-Contained Magnet Operated by Push Button.

A main switch is provided, this being only operative when the magnet device is not in use. It is operated by turning a knurled disc forming the central pole piece of the magnet, completely closing or opening the circuit with each snap. Pressing a push button on the side of the cylinder releases the grip of the magnet so that the lamp may be placed, removed or changed instantly. Releasing the button brings the magnet into service again. After the light has been turned on by the switch the current will continue to flow irrespective of the manipulation of the magnet.

The device will adhere to iron or steel surfaces, smooth, rough or uneven, painted or unpainted, and its grip is unaffected by heat, cold or vibration. One of the many uses to which it may be put is depicted at Fig. 4, which shows it attached to a piece of machinery in operation.

The Magnalamp requires a direct current and is furnished in two standard voltages, 110 and 220 for use with 16 candlepower carbon filament lamps. If utilized with lamps of less candlepower the magnetic grip is said to be less, due to the small amount of current, as the 110-volt member requires about .5 ampere and the 220 about .25 ampere.

Magnalamps are made for service with higher candlepower and for use on other voltages than those designated. In addition to being of service when operating the lathe, drill press, miller, etc., the Magnalamp will prove of value when working on the motor car as it may be attached readily to any metal part of the chassis, facilitating the work. It is not expensive and for a small sum may be augmented by a counter balance device which permits the use of the lamp either with or without the magnetic member.

THE UNIVERSAL AUTO-TURNTABLE.

Numerous stables and other buildings are converted into garages and the original design is such that they do not lend themselves readily to the storage of automobiles without the operator of the car exerting considerable skill in backing the machine into its position. This is especially true of long, narrow buildings. To overcome these difficulties a turntable is fitted and the majority of up-to-date concerns are equipped with one or more of these devices.

Accompanying illustration, Fig. 5, presents the product of the Canton Foundry & Machine Company, Canton, O., maker of cranes, jacks, etc. A feature of the Universal turntable is that it may be installed easily, requiring as it does, but a depth of 12 inches, this arrangement permitting of utilization on upper floors as well as the ground. The device is ball bearing, seven balls operating in a patented grooved, serpentine track. These balls are spaced properly and sustain the weight, and as each member is crowded over the summit another follows into its place. All balls not on a summit revolve in lubricating oil with grooves fully protected from dirt.

The superstructure is of structural steel, built in truss form, top plates are braced, and the entire construction makes for great strength and durability. The table proper has a checkered iron centre, with steel plates extending to its periphery, and these members are sloped slightly to provide for drainage. They are also reinforced by angle irons at proper intervals, these being riveted crosswise underneath and supported on structural trusses. The only foundation required is circular concrete, perfectly level, and slightly larger than the table. The former is grooved to provide drainage to the sewer.

The Universal table is furnished complete with angle iron foundation supporting band firmly bolted to outer rim and the former is fitted with bolts for imbedding into the concrete floor thus holding the band in place. The tables which are operated easily by one person, are made in four sizes, 108, 132, 144 and 156-inch wheelbase with table diameter of 12, 14, 15 and 16 feet, respectively. Each has a supporting capacity of 8000 pounds. A feature of the device is that it cannot tilt as the slightest depression throws castor wheels on the outer rim to the rim track.

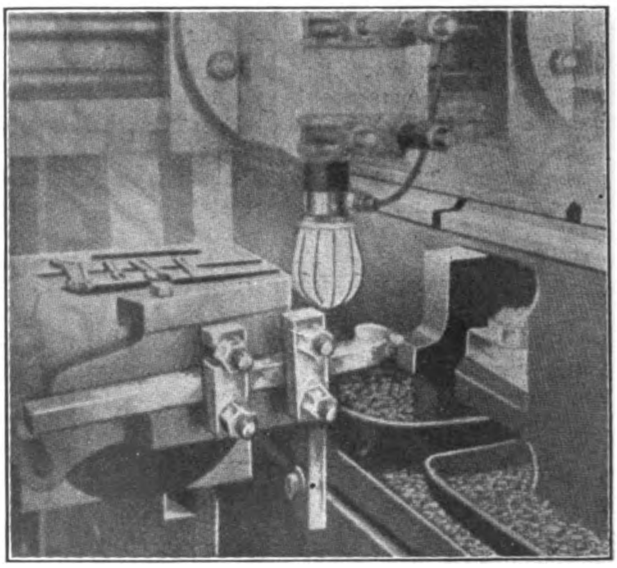

Fig. 4—Showing the Magnalamp Attached to Operating Machinery.

NEW VICTOR AIR COMPRESSOR.

The up-to-date garage no longer relies upon the hand pump, but is equipped with a compressed air system, an arrangement permitting of the storage of air for the inflation of tires, and cleaning the upholstery of the motor car, as well as the chassis. The Victor Electric Company, Chicago, has brought out a new compressor which is designed to be belt driven from a line shaft.

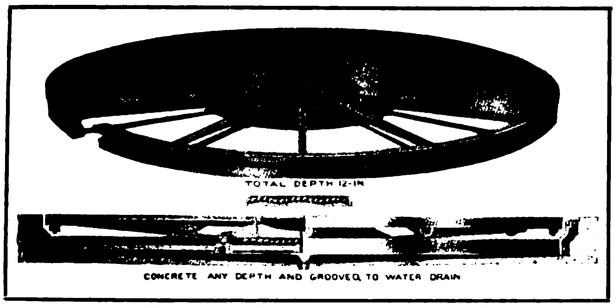

Fig. 5—Universal Auto-Turntable of 8000 Pounds Capacity, Which Operates on Ball Bearings and Requires but a Depth of 12 Inches.

It is a double-cylinder unit, having a 2.5-inch bore and two-inch stroke. The pistons are fitted carefully and means have been provided for keeping these well lubricated. The valves are especially designed and are constructed to withstand the great strain to which they are subjected in operating at high speeds.

The compressor, which is shown at Fig. 6, can be operated safely up to 360 revolutions a minute at which rate it gives a capacity of four cubic feet or 30 gallons of free air a minute. A pressure of 125 pounds may be maintained easily and a higher ratio if desired. The pulley is located between the cylinders and it is claimed that the device operates with the least possible noise, that all parts are interchangeable, and that it is economical in operation.

REMOVING STUBBORN NUT.

While a stubborn stud or sheared bolt is difficult to remove, one can usually unscrew a nut without much trouble, even if it has become more or less rusted in place. A good method to take off a nut that seems to resist being parted from its stud or bolt more than usual is to heat an open spanner that fits the nut and let it rest against the nut for a few minutes. The heat will expand the nut without producing corresponding expansion of the bolt and it may be unscrewed easily. The spanner or end wrench may be heated in a blow lamp flame, and while this kink is very old it is not generally known. One should not heat a hardened wrench or an adjustable member as it may be rendered unfit for use. The blow lamp flame should not be applied to the nut direct because the bolt will be heated and will expand as well as the nut. Kerosene may be poured around the threads with good results, especially if the nut has rusted in place. Several alternate heatings and applications of oil may be needed before the nut is loosened, and if it still resists, a light tapping with a hammer on all the facets while it is hot may assist in having it become looser on the threads.

MACHINING WORK SQUARE IN LATHE.

It is considered a difficult task by some to machine a piece square in a lathe without a special attachment. But it can be done as follows, when there is no other machine at hand: Clamp a toolmaker's vise to the face plate and place the piece to be machined in it with enough projection to permit of facing off one side. Then place the finished side toward the fixed jaw and machine the next face, and so on until the desired work is done. If care be taken in clamping, the job may be done to a surprising degree of accuracy and in a short time.

BEARING SCRAPER.

Motorists who attend to their own repairing, including the overhauling of the power plant, may have occasion to scrape in a bearing which operation will be facilitated by the use of the proper tool. Although not expensive some prefer to make an instrument. This may be accomplished by taking a fairly good sized three-cornered file and grinding off the burr on an emery wheel. This may be done at some shop equipped for this work. When fitted to a wooden handle, the tool will form a valuable addition to the garage equipment.

NEED OF ACID BRASS SOLUTION.

One of the difficulties to be met with in the art of electroplating is one brought about by the automobile industry; viz., the need of a heavy deposit of brass. The present process is by immersion in a solution of cyanide of copper, but the resultant deposit is not only slow in forming but unsatisfactory because of what is technically known as "spotting"—a discoloration in spots which appears on the work after it has been polished and lacquered. Cast metal seems to give the most trouble. This defect is considered as being caused through the absorption of the acids or alkaline solutions by the pores of the metal, or small blow holes which are only partially covered by the deposit, leaving minute openings through which the solution oozes out.

Several remedies have been suggested and tried, such as boiling the parts out in some neutralizing chemical solution or heating in a drying oven for several days, but a remedy completely satisfactory still remains to be found. It would be a great advance if an acid brass solution could be discovered. There is one for copper and another for zinc, but none for brass.

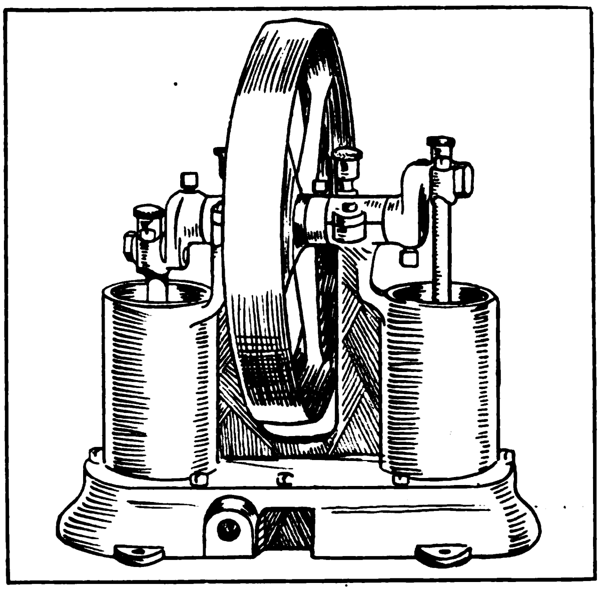

Fig. 6—New Double-Cylinder Compressor Brought Out by the Victor Electric Company.

INDUSTRY IN INDIANA.

The report of E. Dana Durand, director of the 13th census, concerning the manufactures for the State of Indiana, sets forth the following with respect to automobiles, including bodies and parts:

"This industry, for which but one establishment was reported in 1899, had increased in 1904 to 11 establishments, with products valued at $1,639,000. In 1909 there were 67 establishments, the value of whose products amounted to $23,764,000, or more than 14 times that reported in 1904. The manufacture of automobile bodies and parts has become so interwoven with other industries that it is not possible to state how fully the statistics show the magnitude of the industry. A number of the foundries and machine shops, and establishments engaged in the manufacture of electrical apparatus and supplies incidentally manufacture automobile accessories and parts, while a number of the establishments in Indiana classified under the heading, 'Rubber goods, not elsewhere specified,' manufacture automobile tires."

The increase in number of cars produced during the five-year period between 1904 and 1909, insofar as the report can be made without disclosing individual operations, is best set forth in the following table:

Pleasure Cars—	1904		1909	
	No.	Value	No.	Value
Buggies	..	......	1,639	$652,956
Gasoline	..	......	1,576	......
Electric	..	......	63	......
Runabouts	578	$620,334	8,139	5,055,208
Gasoline	208	298,850	8,100	......
Electric	370	321,484	39	......
Touring	424	787,969	6,838	10,710,289
Gasoline	387	735,669	6,838	......
Electric	*37	52,300	....	......
Enclosed	..	......	439	772,401
Gasoline	..	......	100	......
Electric	..	......	339	......
All others	..	......	32	147,232
Gasoline	..	......	30	......
Electric	..	......	2	......
Totals	1002	$1,408,303	17,087	$17,224,231

Electric	407	373,784	443	670,994

Commercial Cars—	1904		1909	
	No.	Value	No.	Value
Delivery wagons	18	$20,160	107	$157,358
Gasoline	..	......	31	......
Electric	18	20,160	76	......
Trucks	..	......	59	223,347
Gasoline	..	......	32	......
Electric	..	......	27	......
Totals	18	$20,160	166	$380,705
Gasoline	..	......	63	......
Electric	18	20,160	103	......
Grand totals	1020	$1,428,463	17,353	$17,604,936
Gasoline	595	1,034,519	16,707	16,734,648
Electric	425	393,944	546	870,288

*Includes one steam touring car.

The growth of the industry is set forth in another manner in the following:

State of Indiana.

	1904	1909
Number of establishments	11	67
Persons engaged	921	7753
Proprietors	6	36
Salaried employees	99	920
Wage earners	816	6797
Primary horsepower	760	5813
Capital invested	$1,194,000	$16,722,000
Salaries paid	80,000	870,000
Wages paid	496,000	4,131,000
Cost of materials	824,000	14,995,000
Value of products	1,639,000	23,764,000
Value added by manufacture	815,000	8,769,000

City of Indianapolis.

	1904	1909
Number of establishments	4	17
Persons engaged	509	2782
Proprietors	...	9
Salaried employees	62	379
Wage earners	447	2394
Primary horsepower	...	2296
Capital invested	$810,000	$5,066,000
Salaries paid	56,000	329,000
Wages paid	278,000	1,466,000
Cost of materials	554,000	5,994,000
Value of products	798,000	8,840,000
Value added by manufacture	244,000	2,846,000

NEW CARBURETOR COMPANY.

The New-Miller Manufacturing Company has been organized in Indianapolis for the production of the Miller carburetor, which first made its appearance in Los Angeles some few years ago. Although no attempt was made to exploit the device through the country until during the Madison Square Garden show in January, 1911, it has been impossible for the Miller Carburetor Company, which originally undertook its manufacture, to take care of the demand. The new concern has acquired a substantial factory in Indianapolis and its executive offices are located in the Murphy building in that city.

The Indianapolis plant will have a capacity of over 70,000 carburetors a year. The officers of the company are: President, F. C. Fairbanks; vice president, A. W. Nash; secretary, K. K. Parrot. L. H. Colvin, formerly sales manager of the Warner Manufacturing Company, Toledo, O., will act as general manager of the organization.

It is claimed that the Miller carburetor is a distinct departure. It is operated mechanically, the opening of the throttle introducing exactly the proper proportions of gas and air into the cylinder, and it is held that when it once has been set will supply this mixture at all speeds. The control is so constructed as to be attached either to the dash or the steering post, and by it the driver is enabled to regulate the flow from the seat, making it unnecessary to raise the hood and adjust the vaporizer for different grades of gasoline or because of climatic conditions.

DIESEL ENGINE COMING.

Dr. Rudolph Diesel of Germany, inventor of the famous Diesel engine, is at present in this country for the purpose of interesting American automobile makers in the utilization of his motor. He declares that within a year it will be adopted as the propulsive agent for motor trucks, and that it is only a question of time before it will be employed in pleasure cars as well. The Bureau of Commerce and Labor in Washington learns that at least one American manufacturer is considering the subject seriously, and while this concern is not engaged directly in the production of vehicles, it is possible that it contemplates future possibilities.

As is more or less well known the Diesel engine was originally produced in 1897. It is built in both two and four-cycle types, and will burn any hydrocarbon from the very heaviest of crude oils to the lighter distillates. It is even claimed that animal and vegetable oils may be utilized for fuel, excellent results having been obtained with both castor and palm oils.

Dr. Diesel delivered an address concerning his motor before the American Society of Mechanical Engineers in New York, recently, this lecture being under the auspices of the gas power section.
